2. The first need restated from a different point of view, a renaissance of nationalism or municipalism. Said Professor Ely:

**A Proposed
Program.**

"Societies have failed and will fail. They cannot, acting simply as societies, do the work. Their resources are inadequate, the territory they can cover is too small, and their power is insufficient. The Evangelical Alliance simply as such can never do the work. The Evangelical Alliance, like other societies, must put itself behind municipal government and recognize the reform and elevation of municipal government as one of the chief features of its work. It must strive to establish among us true cities of God. There is plenty of room for the individual and for individual activity. Not all the work can be done by government, altho without government very little can be accomplished. But in addition to strictly private work, there is room for any amount of individual work in stimulating official work and in cooperation with official work.

"We must recognize this, and the sooner we recognize it the better. The most successful work, says Barnett after his long striving, is done by the Education Act, the Poor Law, and other socialistic legislation. That that is the most successful work is also illustrated by the life and career of the seventh Earl of Shaftesbury, who carried through Parliament legislation which has benefited millions of Englishmen. If simply by touching a person you could confer a distinct benefit on the person touched, it would take you twenty years to benefit as many people as have been benefited by legislation chiefly due to this great philanthropist."

3. Education of all kinds.
4. Good amusements, gymnasiums, parks, etc.
5. Public baths, washhouses, etc.
6. Improvement of artisans' dwellings.
7. Organized medical relief.
8. Temperance.

Such are the main needs of our cities as considered by Professor Ely, and they suggest a large program for the Church.

National churches might do still more. It was proposed at the World's Congress on the Church and the Labor Movement, that among the first things for the Church to do was in conventions and conferences, and finally national councils, to create true ideals of social and industrial life, teaching men of our day what conscience demands in the daily life, even as the canon law (*g.v.*) of the Middle Ages expressed then the sense of the Church on such questions of the daily life as taking of interest, etc. The Church, to do this, needs not to lay down laws, but it should lift up practical ideals.

Again, the Church in pulpit, church paper, conference, and convention should protest against great social wrongs and oppressive monopolies and tyrannies, and agitate for such far-reaching reforms as the lessening of the hours of labor, the progressive taxation of great incomes, the nationalization of land and of monopolized capital, the employment of the unemployed. Says a leading Christian Socialist in England, Rev. S. D. Headlam: "Lastly, I come to what is the main plank in the platform of the Christian Socialist, the chief political reform at which he aims, being bound by his creed to go to the very heart of the matter; to be content with no tinkering. It is summed up in the resolution which was moved by the English Land Restoration League in Trafalgar Square; after which the authorities, being Conservative authorities, wisely settled that no more should be said there for the present. It ran as follows: 'That the main cause of poverty, both in the agricultural districts and in the great centers of population, is

the fact that the land, which ought to be the common property of all, is now monopolized by a few ; and that therefore those who want to cut away at the root of poverty must work to restore to the people the whole of the value which they give to the land, to get for the people complete control over the land, and to that end see to it that those who use land pay for the use of it to its rightful owners, the people." Perhaps, first, above all else the Church should see to it that her own life is rightly fashioned ; that she organize her needy converts in home and foreign fields into true, self-supporting Christian communities ; that she see to it that her own churches be built and her church papers and prayer-books be printed by united labor working during just hours at righteous wages. A church that did this, led by clergy, living from the Christ life in humility and self-sacrifice and lifting up her voice for the oppressed against every oppressor, would be indeed a church following her Master in social reform.

CHURCH AND THE WORKING MEN, THE.—Much has recently been said and written about the separation, existing or declared to be existing at present, between the Christian Church and the so-called working portion of the community. Before we consider the question, a few general facts must be noted which are not always remembered in this discussion. In the first place, it must be remembered that Christianity is not losing, but rather gaining rapidly in numbers in relation to the population as a whole. This is true both of the United States and of the world.

There were, according to Ferussac's *Bulletin Universel* (for 1500-1800), Professor Schém's *Statistics of the World* (for 1875) and M. Pournier de Flaix (for 1895, as quoted in *The World Almanac*):

100	millions of Christians in the year	1500.
155	" " " " " "	1700.
200	" " " " " "	1800.
389	" " " " " "	1875.
447	" " " " " "	1895.

More persons have been added to the Christian faith in this century than in all previous centuries put together.

Of the United States, Dr. Josiah Strong says (*The New Era*, p. 203):

"According to the best available statistics, the Evangelical communicants in the United States in 1800 were 7 per cent. of the population. In 1880 they had risen to 20.07 per cent., and in 1890 to 21.42.

"Thus, the proportion of Evangelical church-members to the population was three times as large in 1890 as in 1800."

Nor is the Church losing in *quality* of life. It has never shown in all its history such vitality as at present. This is seen in the remarkable growth of its activities. Robert Raikes com-

menced the first Sunday-schools in London only a little over a century ago. To-day there are in the world 22,476,050 enrolled in Sunday-schools, and over 2,000,000 of Sunday-school teachers. The Young Men's Christian Association, organized in 1844, has to-day 5000 branches in the United States alone. The Woman's Christian Temperance Union, begun in 1874, has 400,000 members. The Salvation Army has 11,036 *officers*. The Chautauqua movement numbers 200,000. The Young People's Society of Christian Endeavor, begun only in 1881, has over 2,000,000 members to-day.

Nor is the Church lacking in very great humanitarian efforts. Institutional churches (*q. v.*), whose special function it is to work among the so-called working classes and to care for the whole man, soul and body and mind, are characteristic of modern Christianity. They are to be found in all our large cities and in most of our larger towns.

One church alone in New York City spends \$100,000 annually, and mainly in practical charities. The annual sum spent in various charities in London, and largely by Christians, is no less than \$25,000,000 (C. S. Loch, *Charity Organization*, p. 43). And these institutional churches and many other churches do reach working men. The opposition of working men to the Church is audible ; it comes largely from the members of labor organizations, but these are, after all, a small minority of the working classes ; and among those who do not belong to labor organizations and whose voices are not often heard in the labor movement, there are thousands and thousands of working men, and beyond all question a growing number of working men, who are regular and quiet attendants upon Christian churches. Some of these churches believe they have solved the question, "How to reach the working man?"

Nevertheless, in spite of this view, there is quite a different and a more serious side to the question. Because the *communicants* in the churches are increasing faster than the population, and because certain churches are reaching working men, it does not follow that the Church is growing in the number of its adherents and in its general hold upon the community. The fact seems to be that the number of communicants is growing, but that church attendance is falling off ; that the proportion of attendants who are non-communicants has been greatly reduced. The Church seems to be doing a better work among certain classes, but not to be gaining the masses. Dr. Strong said in the first edition of *Our Country* (p. 216):

"Our churches are growing, our missionary operations extending, our benefactions swelling, and we congratulate ourselves upon our progress; but we have only to continue making the same kind of progress long enough, and our destruction is sure."

In his second edition he says, in place of the above: "The Church of Christ has aroused herself in some measure, but, so far as I can judge, the dangerous and destructive elements of society are still making greater progress than the conservative."

In the *New Era* he says (p. 204): "Few appreciate to what extent we have now become a non-church-going people. Mr. Moody said a few years ago: 'The gulf between the Church and the masses is growing deeper,

wider, and darker every hour.' . . . If the many towns and cities which have been investigated in various States are fairly representative of the whole country, we may infer that less than 30 per cent. of our population are regular attendants upon Church, that perhaps 20 per cent. are irregular attendants, while fully one half of the people of the United States, or more than 32,000,000, never attend any church service, Protestant or Roman Catholic."

As for the churches who do reach working people, it is doubtful if they reach many of the best of the working class. Dr. Strong implies that they do. He says (*idem*, p. 221): "The Church is spending her energies on the *best* elements of society, her time is given to teaching the most *intelligent*, she is medicating the *healthiest*, she is salting the *salt*, while the determining masses, which include the most ignorant and vicious, the poorest and most degraded, are alike beyond her influence and her effort."

We doubt if this is the fact. The Church seems to us to be reaching the comfortable and the very poor, but not the best, at least not the best among the working classes—certainly not those in organized labor, and these we believe to be the best among working men. These working men who believe that they are not receiving their just dues, that they are wronged by the capitalist class, look on charitable institutions not as an expression of Christian love, but as a mere sop to Cerberus.

Says Rev. S. L. Loomis (*Modern Cities*, p. 82):

"It will not be difficult to convince those who are acquainted with the life of our cities that the Protestant churches, as a rule, have no following among the working men. Everybody knows it. Go into an ordinary church on Sunday morning, and you see lawyers, physicians, merchants, and business men with their families; you see teachers, salesmen, and clerks, and a certain proportion of educated mechanics; but the working man and his household are not there. It is doubtful if one in 20 of the average congregation in English-speaking Protestant city churches fairly belongs to this class; but granting the proportion to be so great as one in 10 or one in 5, even then you would have two thirds of the people furnishing only one tenth or one fifth of the congregation."

Dr. Washington Gladden said in 1883: "In my own congregation, which worships in a very plain church, the seats of which are free, in a neighborhood easily accessible to the working classes, and which has been known always as an extremely democratic congregation, I find only about one tenth of the families on my list belonging to this class. . . . This is the result of repeated special efforts made in the interest of the working classes, with several courses of lectures on Sunday evenings for their benefit."

In this connection Dr. Gladden added: "How is it with the other extreme of society? In this same city I asked one of the best-informed citizens to make me out a list of 50 of the leaders of business. He did not know my reason for wishing such a list, but after it was put into my hands, I found that 55 per cent. of these men were communicants in the churches, and that 77 per cent. of them were regular attendants upon the churches. A large proportion of the capitalists are more or less closely identified with the churches, while of the laborers only a small share are thus identified; and the number tends to decrease rather than increase." A similar inquiry in an Eastern city of about 40,000 inhabitants showed that three fifths of the leading citizens were church members, while four fifths were regular church attendants.

The situation in England seems to be the same. Canon Farrar, speaking of the Church of England, says (*Harper's Magazine*, May, 1891): "Not 3 per cent. of the working classes, who represent the great mass of the people, are regular or even occasional communicants."

Concerning the feeling of working men to the Church, Dr. Strong says (*The New Era*, p. 214):

"The Committee on the Work of the Churches of the Massachusetts Congregational Association made inquiries as to the attitude of the working men of Massa-

chusetts toward the churches. Circulars were sent to some 200 State and local labor leaders. The many failures to reply, together with the tone of curt refusals to answer, or the return of blank circulars, indicated anything but a kindly feeling toward the churches. Most of the replies sent expressed the opinion that laboring men have been alienated from the churches. 'The causes given of alienation are all modifications of the charge that churches and preachers are allied with and subservient to the "oppressing class."' 'Seldom is the Church just enough even to be neutral. It is a "mammonized" institution; it belongs to the plutocrats,' etc. (Rev. John P. Coyle, *The Churches and Labor Unions, The Forum*, August, 1892).

"Like charges are common at labor meetings. At such a meeting in Union Square, New York City, one of the foremost representatives of organized labor in the United States, a man of national reputation, occupied some 20 minutes in pouring out a lava stream of vituperation against the Church and its ministers, both Protestant and Roman Catholic. The Young Men's Christian Association was called 'that scab institution.' 'Cooper's Institute did more good in a week than all the New York churches in a year,' and a certain New York daily paper 'represented the spirit of true brotherhood more in a single issue than the Christian ministers, the parasites of society, could do in an age of their hired mouthings.' And these utterances were lustily cheered by the large audience of working men.

"In their struggles, working men have little expectation of sympathy or help from the churches. They do not appreciate the fact that, apart from their own class, most of those who are seeking to secure the rights of labor are Christian men, and a large proportion of them clergymen. Still it is not strange that the attitude of a majority of churches and ministers should be supposed to represent the whole. Professor R. T. Ely writes: 'The secretary of the Journeymen Bakers' National Union sent out appeals to the clergy of New York and Brooklyn to preach against Sunday labor, and help them to abolish it. Five hundred circulars were sent out, but little response was met with. In a reply to a query as to their success, the disgusted secretary sent this answer to the writer of the present paper: "Out of the 500 circulars sent to the clergy of New York and Brooklyn half a dozen answered. You will have a hard time, Professor, to convince the toilers of this country that the clergy will ever do anything for them.'"

"When those classes which in all Christian history have been the most susceptible to the Gospel become the least susceptible to it, there is something wrong, something abnormal. Has human nature changed? Has the Gospel changed? Is it not worth while to ask whether indifference or antipathy to the Church is identical with indifference or antipathy to the Gospel? And when that question has been answered it will be in order to inquire whether the gospel we preach is really Christ's Gospel.

"Recent investigators have stated that the 'German Social Democrats, tho hostile to official Christianity, are ready to avow themselves followers of Jesus.' This led the committee of the Massachusetts Congregational Association, when making the inquiries already referred to, to ask whether the working men who disbelieve in the churches also disbelieve in Jesus, 'With few exceptions the answers are that belief in Jesus is common; and this testimony is borne in many cases with much warmth. . . . It is commonly said that if the churches and ministers would be faithful to Jesus, no alienation would exist.' It has been repeatedly said by working men that they do not disbelieve in Christianity, but in '*Churchianity*.' The distinction was made clear and marked by that great audience in New York which applauded the name of Christ and hissed a mention of the Church.

"We need not stop to inquire in what sense men who disbelieve in the Church 'believe in Jesus.' This distinction, on which they insist, forbids the assumption that the masses are indifferent or hostile to the Gospel because they are indifferent or hostile to the Church; and forces upon us the question whether the Church really teaches and exemplifies the Gospel of Christ.

"The Church teaches the gospel of personal salvation; but this is only one half of Christ's gospel. He preached the gospel of the *Kingdom*, which is the gospel of social regeneration. He taught the gospel of human brotherhood as well as that of divine Fatherhood, and laid down the law of both; and the second fundamental law of Christ, which is the organic law of a normal society the Church has neglected. If she had accepted and inculcated and exemplified this teaching of Christ as the practical law of every-day

life, it is quite safe to say she would never have lost her hold on the masses."

To sum up the attitude of the working men to the Church, they largely regard the Church as hopelessly mammonized, its ministers a class of professional talkers who receive comfortable salaries from rich people for managing their "spiritual clubs" and doling out a little charity in place of justice from the large profits taken by the rich out of the poor. They are never weary of comparing the lives and salaries of modern ministers with the life of Christ, and the practice of modern churches with that of the Church of the Upper Chamber in Jerusalem. It is well, therefore, that the Church is rousing herself to an interest on social questions. Few realize how wide is this movement.

The *Dawn* two years ago published a list of several hundred clergymen who had shown their interest in the labor movement by some public utterance, or joining some society for the study of social problems. The Christian Social Union, an organization in the Protestant Episcopal Church, for the study and preaching of Christ's social law, has reached a membership of 1000, very largely clergymen. The American Institute of Christian Sociology has reached as many more in all churches. The Brotherhood of the Kingdom, mainly a Baptist organization, works on the same lines with commendable zeal. In New York City, the Church Association for the Advancement of the Interests of Labor, another Episcopal organization, has a board of conciliation and arbitration, with Bishop Potter at its head, which has been instrumental in settling more than one strike. This association holds meetings in various Episcopal churches, where the cause of the workers is strenuously urged. In Boston, the Church of the Carpenter has existed five years, for the purpose of rousing the Church to do its duty on social matters, and has some of the most prominent trade-unionists of the country in its membership. The Society of Christian Socialists, that was organized in Boston, has become defunct, but its truths have gone widely through the land. Almost every city and town has at least one clergyman who boldly proclaims the rights of the working man. Clergymen to-day not infrequently aid strikes by public and private utterance. In several theological schools Christian sociology is taught, while such writers as Professor R. T. Ely, Rev. G. D. Herron, Dr. Lyman Abbott, Washington Gladden, and such papers as the *Dawn*, of Boston, the *Kingdom*, of Minneapolis, spread Christian social thought far and wide.

CHURCH ASSOCIATION FOR THE ADVANCEMENT OF THE INTERESTS OF LABOR, THE.—This society, commonly known as "C. A. I. L.," was founded in 1887, in New York City, by communicants of the Protestant Episcopal Church. The Rt. Rev. F. D. Huntington, Bishop of Central New York, was elected president. It was felt that the Church should take active measures to show her sympathy with the laboring classes in their struggle for justice, and C. A. I. L. grew out of a desire to carry this sympathy into effect. Its object is "the advancement of the interests of labor by the application of the principles of the Gospel of Jesus Christ," and its five principles are as follows:

1. It is of the essence of the teachings of Jesus Christ that God is the Father of all men, and that all men are brothers.

2. God is the sole possessor of the earth and its fulness; man is but the steward of God's bounties.

3. Labor being the exercise of body, mind, and spirit in the broadening and elevating of human life, it is the duty of every man to labor diligently.

4. Labor, as thus defined, should be the standard of social worth.

5. When the divinely intended opportunity to labor is given to all men, one great cause of the present widespread suffering and destitution will be removed.

The Association works by sermons, prayer, corporate communion, lectures, distribution of literature, political action, and cooperation with other societies. It is confined in membership to communicants of the Protestant Episcopal Church or churches in communion with it, and has among its members 38 bishops of the American Church and four bishops of the Canadian Church. In New York City it has recently been very active in working for the passage of industrial legislation, in holding meetings in Episcopal churches where representatives of the working classes are invited to state their wrongs and desires, while representatives of the employees' interests are also heard. The society has also established a Council of Conciliation and Mediation, with Bishop Potter, of New York City, at its head which has been influential and successful in conciliating and terminating more than one important strike.

CHURCH SOCIAL UNION, THE.—The Church Social Union is a society in the United States, organized in New York City under the name of the Christian Social Union, April 3, 1891. The prime mover was the Rev. Robert A. Holland, S.T.D., of St. Louis, who had just then spent some time in Oxford and become deeply interested in the work of the English Christian Social Union (*q.v.*). The society was organized here with the same principles and on the same lines as the English union (*q.v.*). The president was the Rt. Rev. F. D. Huntington, S.T.D., Bishop of Central New York, and the secretary, Professor R. T. Ely, of Johns Hopkins University, Baltimore, Md. The society issued several bulletins, and sent the Rev. W. D. P. Bliss on a preaching and organizing tour. Many branches were formed, and a membership of 1000 secured. But, after Professor Ely's removal to the University of Wisconsin, the union, with a scattered executive, failed to maintain activity, and almost came to an end. November 17, 1894, however, it was reorganized in Boston; the name was changed to the Church Social Union; a new constitution was adopted; the Union was placed on a distinctively churchly basis; an executive committee was chosen with a working majority in Boston. As a result, activity has again been reached. The union publishes two monthly series of papers, one upon the general principles of the Union, the other upon concrete economic or social themes. Membership is limited to the Protestant Episcopal Church or any Church in communion with it; but any person can subscribe for its publications (\$1 per year). Election to membership is not necessary. Its present membership (1895) is about 500; its president, the Rt. Rev. F. D. Huntington; its secretary, the Rev. George Hodges, D.D., Cambridge, Mass. The declared objects of the Union are identical with the principles of the English Christian Social Union (*q.v.*), but under its new constitution the Church Social Union has also adopted as a further statement the principles of the Church Association for the Advancement of the Interests

of Labor (*g.v.*), since it was proposed to amalgamate the two societies, tho the amalgamation was not finally accomplished.

CHURCH TEMPERANCE SOCIETY.

—This is the shorter name of the "Temperance Society of the Protestant Episcopal Church of the United States of America." It was organized in 1881. It is under the general control of an executive board of 30 members, and of the bishops of the Church who act as vice-presidents. The object is threefold: 1. Promotion of temperance; 2. Rescue of the intemperate; 3. Removal of the causes of intemperance. Its basis is thus defined:

"Recognizing *temperance* as the law of the Gospel, and *total abstinence* as a rule of conduct essential in certain cases and highly desirable in others, and fully and freely according to every man the right to decide, in the exercise of his Christian liberty, whether or not he will adopt said rule, this Society lays down as the basis on which it rests and from which its work shall be conducted, union and cooperation on perfectly equal terms for the promotion of temperance between those who use temperately and those who abstain entirely from intoxicating drinks as beverages."

The country is divided into four general departments: 1. Central, including New York, New Jersey, and Connecticut; 2. New England, including Maine, New Hampshire, Vermont, Massachusetts, and Rhode Island; 3. Pennsylvania, including Pennsylvania, Delaware, and Maryland; 4. Ohio, including Ohio, Michigan, and Indiana.

For remedial agencies the Society names the following: 1. The Gospel; 2. Coffee-houses as counteractives to saloons; 3. Improved dwellings for the poor; 4. Healthy literature. To help supply the last-named want, it publishes a monthly paper called *Temperance* (New York). Its policy is that of restriction rather than pro-

hibition. It aims at (1) prohibition of sale on Sunday; (2) prohibition of sale to minors; (3) prohibition of sale to intoxicated persons; (4) high license or tax of \$1000 on every saloon; (5) only one saloon to each 500 people; (6) local option.

No pledge is administered to a child without the written consent of his parents. No alternative pledge can be taken until the person subscribing to it is 21 years of age. No life-pledge is given to any. The conditions of membership are, assent to the constitution and the payment of \$1 a year. Outgrowths of the Society are juvenile organizations called the Knights of Temperance and Young Crusaders. The central office of the Society is at the Church Mission House, 281 Fourth Avenue, New York City. Its secretary is Robert Graham.

CIGAR-MAKERS' INTERNATIONAL UNION OF AMERICA, THE.

—The first union of cigar-makers was formed early in the fifties in Baltimore, Md., but it was not until June 22, 1864, that a National Cigar-makers' Union was formed, which, at the convention held in Buffalo in 1867, was changed to the Cigar-Makers' International Union of America. This Union is one of the strongest trade-unions in America, and numbers at present close to 30,000 members, or about 65 per cent. of the skilled cigar-makers of America. Persons engaged in cigarette-making or who work in tenements or cigar sweat shops are not eligible.

The union is remarkable for the high dues paid by its members, and therefore for its financial strength, its resulting ability to gain advantages from employers (often without a strike), and also its ability to care for its sick or unemployed members.

The following table shows the amount paid in benefits by the International Union in the last 15 years:

YEAR.	Strike Benefit.	Sick Benefit.	Death Benefit.	Travel Benefit.	Out of Work Benefit.
1879.....	\$3,668.38
1880.....	4,950.36	\$2,808.15
1881.....	21,797.68	\$3,987.73	\$75.00	12,747.09
1882.....	44,850.41	17,145.20	1,674.25	20,386.64
1883.....	27,812.13	22,250.56	2,609.00	37,135.20
1884.....	143,547.30	31,551.50	3,920.00	39,632.08
1885.....	61,087.23	29,379.80	4,214.00	25,683.54
1886.....	54,402.61	29,225.59	4,820.00	31,835.71
1887.....	13,871.62	63,900.88	8,850.00	40,281.04
1888.....	45,303.62	53,824.19	21,319.75	42,894.75
1889.....	5,202.52	59,519.04	19,175.50	43,540.44
1890.....	18,414.27	64,660.47	26,043.00	37,914.72	\$22,760.50
1891.....	33,531.78	87,472.97	38,068.35	53,535.73	21,223.50
1892.....	37,477.60	89,906.30	44,701.97	47,322.47	17,460.75
1893.....	18,228.15	104,391.83	49,458.33	60,475.11	89,402.75
1894.....	44,966.76	106,758.37	62,158.77	42,154.17	174,517.25
Total.....	\$579,112.38	\$781,975.51	\$287,168.92	\$548,756.84	\$325,364.75

Total benefits paid in 1894..... \$430,555.32
Grand total of benefits paid..... 2,522,378.40

The cash in the International treasury on January 1, 1894, was close to \$500,000. This amount was considerably reduced during the last year, owing to the heavy drafts made upon the treasury to meet the payment of the "out-of-work" benefit. The amount of available funds January 1, 1895, was \$340,788.66.

We quote at length the following from the

Report of the Bureau of Labor of Minnesota (1891-92, p. 256), because it gives a convincing statement of the value of such unions. The report says (in condensed form):

"In judging the cigar-makers, it should be borne in mind that they occupy a field in the industrial world

the most difficult of all in which to achieve success. Their labor comes constantly into sharp competition with that of the workers in tenement-house factories, or 'sweating dens.' It is also met by the product of the cheap Chinese labor that has found a home in our borders. No other class of American toilers is forced to meet this sharp and peculiar competition to the same extent. The cigar-makers in the tenement-houses work long hours at very small compensation. Many of them toil for 12 and 14 hours and even longer each day. These workers do not belong to the union. They are unorganized. Now, while these unorganized cigar-makers thus labor long hours at a very low compensation for the most part, the members of the International Union toil for only eight hours a day. This eight-hour work day was secured by them in the year 1886, and has since that time been maintained. The product of their toil is constantly sold in competition with that produced in the sweating dens and by the cheap prison and Chinese labor. This fact must be borne in mind in judging their success in maintaining their eight-hour work day.

"The insurance benefits of the cigar-makers are five in number. They are known as the strike, sick or disability, death, out-of-work, and traveling benefits. The first of these, the strike benefit, is paid to those members of the union who are out of work by reason of a strike which has been approved by the proper authorities of the organization. This benefit applies to those suffering by lockouts in the same way. Members out of work, from either of the above causes, receive a benefit of \$5 a week for the first 16 weeks of the labor trouble—after that time the strike allowance is only \$3 a week, and that sum is continued until a settlement of the difficulty or the strike is declared off. The regulations for the giving of this strike fund are all framed so as to make it difficult to have a strike unless the cause is a just one. A strike cannot be supported for any length of time except by vote of the 25,000 members. They secure all the facts in the case by the examination of their paid agents. These agents report the facts of the strike as they find them, and on the facts thus presented the members vote. They decide whether the strike shall longer be sustained. If they vote nay, no more money of the order can be paid out for the particular labor difficulty.

"Members who have been in good standing for not less than one year are entitled, in case they become sick, to what is called a sick benefit. This is the payment of \$5 a week for a period not to exceed 13 weeks in any one year. No member is, however, privileged to draw this benefit if he or she has brought on the ill-health by intemperance, debauchery, or other immoral conduct. No member can draw more than one benefit at any one time. Thus, he cannot draw a strike benefit while receiving a sick benefit, or the reverse. The same principle applies to all the other gratuities of the order. Members not entitled to sick benefits, owing to their not having been members for a full year, are not suspended for non-payment of dues while sick. They have four weeks in which to pay those dues after their return to work subsequent to any illness.

"Upon the death of a member, who has been such for one year, the sum of \$50 is paid by the Cigar-makers' Union toward defraying the expenses of his funeral or cremation. This sum is paid to the nearest of kin of the deceased member. Upon the death of a member, who has been such for two consecutive years, the sum of \$200 is paid in the same way and for the same purposes. To the heirs of one who has been a mem-

ber for ten consecutive years is paid, at death, the sum of \$350, and to those of a member for 15 consecutive years is paid, in the same way, \$550. Upon the death of a wife or widowed mother depending upon him for support of any member who has been such for two consecutive years, the sum of \$40 is paid to the member thus afflicted.

"A member having paid weekly dues for a period of one year is entitled to an out-of-work benefit of \$3 per week, and 50 cents for each additional day. A member having received this benefit for six weeks is not entitled to the payment for seven weeks thereafter, and not more than \$72 shall be paid to any one individual as an out-of-work benefit during any one year. A member losing his employment through intoxication, disorderly conduct, dishonesty, or courting his discharge through bad workmanship or otherwise, is not, however, entitled to an out-of-work benefit for eight weeks thereafter.

"The foregoing benefits are gifts or payments not to be returned to the union by the recipient. In addition to them the union maintains a system of loans to those members out of work in any place, unable to secure occupation there, and desirous of traveling to gain work elsewhere. The object of this loan is to furnish the member with a sum sufficient to pay his car fare to the town where he can gain work. He cannot receive more than sufficient to take him to his proposed destination. Neither can he receive, at any one time, more than \$12, nor more than \$20 in the aggregate until the first loan has been repaid. A member, to be entitled to this loan, must have been in good standing continuously for at least one year preceding. The total amount loaned by the order since the establishment of this benefit was, January 1, 1892, \$398,395.09. Of that amount all had been repaid, but \$60,764.74. Doubtless some part of these loans will never be repaid, owing to the death of a few members before they have had a chance to discharge their obligations. Another small part must be lost through members who desert the union after obtaining the loan. The total lost through these causes cannot be accurately determined even by the officers of the union. It, however, is small and cannot exceed five per cent. of the amount trusted out in this way.

"In placing an estimate upon the value of this service of the union to its members it should be recalled that the cigar-makers follow a calling attended with many uncertainties. There is a constant moving about among the members. The average worker is temporarily out of a job two or three times a year. Without the aid of such a free employment bureau, as has been described above, he would be forced to lose more or less time hunting for situations and pay greater or less sums every year to employment agencies for the same purpose. The economy and wisdom of the management of the union can then be judged by its expenses in maintaining this system of free employment agencies for its members.

"In addition to the sums paid as insurance and traveling benefits the cigar-makers expend large sums of money for definite purposes, either to advance certain special interests of the members of the craft as a whole, or to promote the cause of organized labor, or for general charity. Charity, in various forms, calls for considerable sums of money each year. These disbursements, authorized by the international rules, and paid from the common treasury of the order, are given in the following table. (We give the table only in abridged form.)

YEAR.	Benefits Given.	Assistance to Unions, Aid to Strikes, etc.	Total Disbursed for Objects of the Union.	Expenses of Management.	Added to Reserve Fund.
1882	\$63,669.95	\$5,880.70	\$73,903.34	\$24,552.36	\$37,244.95
1883	52,752.69	17,150.00	74,555.38	28,481.26	41,425.19
1884	179,018.86	113,335.00	298,066.86	43,367.30
1885	94,681.17	37,279.00	137,413.17	41,500.82	15,454.98
1886	101,448.20	33,924.00	151,229.78	60,556.85	87,301.79
1887	86,622.50	4,425.00	106,673.89	74,037.86	54,414.99
1888	125,447.50	9,700.00	151,300.03	67,281.84	11,962.29
1889	83,897.96	2,190.00	98,740.70	74,151.90	45,946.01
1890	131,878.24	3,850.00	152,213.29	73,646.91	97,956.33
1891	180,296.60	700.00	202,839.86	107,590.42	38,877.19
Total	\$1,099,713.73	\$228,433.70	\$1,446,996.30	\$595,167.52	\$373,859.15

"The figures given include all sums paid as strike benefits, and also all amounts given to unions on strike, etc. The average for the first five years is \$8177, and

for the last five only \$1353. From this it can be seen that the general tendency of the union is to decrease the amounts paid by the organization for strikes. This

proves the truth of the claim made for the organization that it seeks to lessen these labor disturbances, and also that this desirable end is advanced by the existence of a large reserve fund such as the cigar-makers at present have at their command. Another fact to be noted in this connection is this: The average expense of management increases as the strike disbursements decrease. This tends to show that the effort of the union is being more and more directed to lessen or prevent strikes and lockouts. The success of the movement on the part of the organization may be measured by the amounts saved in strike expenditures. This, for the last five years, averaged \$6824 less than it was for the preceding five.

"If the affairs of the Prudential, Metropolitan, Germania, and John Hancock, the four companies doing an 'industrial' business in the United States, were all to be conducted on the same economical basis, the saving effected over the present administration would amount to over \$5,000,000 in the year 1891. This is a sum greater than the loss to employers and employees in the United States by the strikes of that year. If strikes are to be deplored and avoided whenever possible, this large relative cost of managing 'industrial' life insurance by the business corporations should call for remark, and the saving effected by this trade-union commended.

"Strikes occur only rarely. They attract attention as large conflagrations by the glare and smoke and noise which they occasion. The unions are frequently placed in that glare and din, and that side of their activity has most attracted popular attention. But the business activities of the unions, their administration of their benefits and charities, are all conducted in quiet. They attract no man's attention. That business management, in the case of the cigar-makers, lessens strikes and pays for its costs in that way in a twofold manner. That union also saves its members several times its costs in its quiet work of securing them employment. And the foregoing comparisons indicate that the union, in the same unobtrusive manner, dispenses industrial insurance and other benefits with a saving which balances all strike expenses and all other disbursements growing out of the application of union principles. Here is a saving far in excess of the loss which attracts popular attention. The union should have the credit for this side of its activities."

In 1880 the International Union adopted a trade-mark, known as the "blue label." It is estimated that it has spent \$1,000,000 in advertising this label, and with great success, so that the label is widely used as a guarantee of union-made cigars. The cigar-makers were the first American international trade-union to adopt the *referendum* in electing its officers, amending its constitution, and deciding all important questions. The prominent members of the union are Samuel Gompers (*q.v.*), long president of the American Federation of Labor, and Adolph Strasser, for 14 years its president. George W. Perkins is the present (1895) president.

CITIZENS' LAW AND ORDER LEAGUE. See **LAW AND ORDER LEAGUES**.

CITY AND SOCIAL REFORM, THE.—A city may be defined in general as a large or important town; more accurately, it is an incorporated municipality, usually governed by a mayor, aldermen, and common council. The number of inhabitants required to constitute a city in the United States is usually 10,000, but in some western States it is as low as 3000. In Great Britain a city is usually a corporate town which is or has been the seat of a bishop. We consider the subject in this article under five heads: I. History—(a) ancient; (b) medieval; (c) modern. II. Present Status. III. Statistics. IV. Need of Reform. V. Methods of Reform.

I. THE HISTORY OF THE CITY.

The origin of cities loses itself in the unknown past. They existed along the valleys of the Nile, the Tigris, and Euphrates, by the rivers of India, and upon the plains of Mexico and Peru. Discoverers, as at Troy, have often found the ruins of one city buried many feet below the ruins of another, these in turn many feet below the present soil. Into this interesting subject of the primitive cities we cannot go. It is doubtful if these early cities from the standpoint of social science had any true civic life. They seem to have been gigantic conglomerations of walled-in populations, ruled by some despot or family of lords or priests, who sometimes, indeed, gave to the city a rude splendor and developed monumental art, yet without allowing to the citizens any corporate life of their own. The inhabitants were simply the slaves of some king, perhaps the devotees of some god. It is in Greece that we come to the first actual city in the sense of the corporate unity of many citizens. Greek social polity (*q.v.*) turned upon the conception of the city, begun undoubtedly as a colony from some patriarchal clan, but early developing organized democratic life. (See **ATHENS**.) Many of the cities, however, were long *oligarchies*, and often even after democratic life had been gained some family or families would gain the power and establish an oligarchy. Sometimes an individual would gain the power and establish a tyranny, which was, however, personal, rarely inherited. The city was usually supreme, and not a part of any State. It dominated the country around, made treaties, waged war, etc. It was in the eyes of the citizen sacred, his Church as well as his home. The city entered into, ruled, and conducted all kinds of activities. It built temples, markets, theaters, gymnasia. It conducted worship, games, instruction. It sent out colonies and ruled commerce. It worked mines, fields, and factories. It supported its free citizens rather than was supported by them. (See **ATHENS**.)

Ancient Cities.

The Classic City.

Citizenship was limited, but the assemblage of the citizens was supreme. Often, however, officers were nominally elected who were virtually irresponsible. Next to the citizens came a class of "aliens," subject natives or foreigners, having special rights on payment of special taxes. At the bottom of the whole structure in every city were the slaves. Even a democracy of free men was simply a democracy of slave-owners. Thus at Athens there were at one time at least 140,000 slaves, 10,000 resident aliens, and 21,000 male citizens. (For the condition of these slaves, see **SLAVERY**.) Two gigantic evils resulted: First, danger of servile revolts, which not infrequently broke out with terrible results (see **GULDS**), and were put down only by relentless cruelty; secondly, class antagonisms were roused between other classes of citizens. Civil war became the order of the day. The State was either paralyzed by internal conflict or demoralized by corruption. Slavery ate out the life of ancient cities. In the Roman civilization gradually the city lost its sovereignty and became a part of the empire, furnishing the transition to the medieval city.

In the early Middle Ages the city lost power before the military chieftain and the robber castle. Feudalism (*q.v.*) magnified the country over the city. Where feudalism was weak, as in South France, or in Italy, or where natural conditions were favorable, as along the Adriatic coast, the Rhine, and the northern coast of Europe, cities were developed soonest. In the north the struggle of the cities for independence was fiercer and their development, therefore, slower, but stronger. They grew by work, by art, by commerce, not by war. All through the eleventh and twelfth centuries they developed rapidly. The Italian republics, the cities of the Hanseatic League, the Flemish and English cities, the often dominated by a fierce and quarrelsome nobility, tended, on the whole, to develop the rule of the trader rather than of the noble or the chieftain. They became first the creator and then the creature of the guilds (*q.v.*). Gradually as the national life developed itself, the city became but a part of the nation, ready to gain commercial rights and privileges and representation in Parliament, for contributions to the royal treasury. Where the royal power was greatest the cities lost their power first, as in France, and England, and Spain; later, in Germany and Italy. Free thought, however, developed in the cities, and the Reformation and the Renaissance were largely matters of the city. The medieval

Middle Ages.

city was a democracy more truly than the classic cities, but not at all so pervasive. It ruled commerce and trade; it sharply watched the market and attempted to fix prices, decide industrial disputes, but it did not conduct activities, as did the Greek city. The medieval city was ruled by the individual citizens more than it ruled them. Yet the city played a much larger part in industrial and social life than ordinarily to-day. Mr. Albert Shaw (*Municipal Government in Great Britain*, p. 21) gives the following sketch of a medieval town:

"The rise of town life, which dignified mercantile pursuits and handicrafts, had opposed the system of leagued and equal freemen, of burgesses, of incorporated citizenship, to the feudal military system of lordship and vassalage. And this was a great preparatory step toward modern institutions and conditions. We know that there was a certain dignity and form about municipal life that appears well in the retrospect. We have surviving, here and there, a fine old medieval town-hall, or guild-hall, with its banqueting-chamber and its council-room. There was much stateliness in the office of mayor; and the old maces of mayoral authority survive to this day. Then there was impressiveness in the liveries that the freemen of the guilds sported on formal occasions. As for municipal conveniences, those were times when life was simple, and 'modern improvements' not so much as dreamed about. The streets were narrow, with the houses built close upon them. The paving was of the rudest character. There was simple surface drainage, and no garbage removal or cleansing system.

The Medieval City.

Water was supplied from a few town fountains or public wells. Street-lighting had not been invented, and early hours were prescribed. Most towns had a skirting of common lands, where the cows were pastured, and where, in many cases, fuel was procured. The houses were, in large part, built of wood; and in spite of vigilant 'watch and ward' and compulsory hearth precautions, destructive fires were not infrequent. The death-rate, of course, was high. There was infection in the wells, and no means of checking the spread and fatality of the frequent 'plagues' that swept the towns. But the science of public sanitation being undiscovered, these things were accepted piously as inscrutable visitations of God."

The modern city is somewhat of a return to the Roman city. It is the creature of the State. The industrial and political revolutions of the last century shattered the ancient rights and privileges of the medieval boroughs and guilds. The city has had little sovereign power. Nevertheless, the growth of the factory system, and, above all, the development of railroads and centers of commerce, has crowded people more and more into cities. Cities have grown in size, but not in corporate power.

Modern History.

Hence they have become unwieldy, shapeless, confused, with often little true civic life. The modern divorce, too, between Church and State has at least temporarily hurt the city in a portion of its life. It has given to the city responsibilities which the city has not always been willing to accept. The poor and needy have been left to seek from confused private charities what formerly they received from the Church as part of the organized city life. The problems of modern city life grew out of this sudden development of modernity without a corresponding development of organic municipal life.

II. PRESENT STATUS.

The modern city in England, France, and the United States, markedly, and to a less extent in Germany, is the creature of the State. It can only do what it is chartered to do by the State. It has in some cases almost lost the right of self-government. It raises its own rates, but often has its taxes collected for it by national officials; it is in many cases responsible for its own peace and order, but it has no control over an armed force, and has to ask for its help if it requires it. On the other hand, it exercises many local functions which in the Middle Ages were left to the Church or to compulsory or voluntary private effort.

Poor relief, education, sanitation, police, the

supplying of light and water, are usually in the hands of the city, while the conduct of justice, of national defense, of postal communication, and commercial regulation are in the hands of the State.

Considering first American cities, we find a general similarity coupled with considerable variety in the details of their charters and constitutions. They are all the creations of the State. Formerly each city received an especial charter; now cities of a certain size in the same State are liable to receive similar charters. These charters, too, differ according to the time when they were issued. The older charters are

American Cities.

apt to contain provision for mayors with short terms and limited powers; for two legislative bodies with large powers, generally modeled after State constitutions. Later charters show suspicion of municipal legislative bodies, and develop so-called non-partizan commissions. Still later charters are apt to trust very large powers to the mayor, as in the recent charter of Greater New York, hoping, by making one man responsible, to secure efficiency and purity. The mayor is always elected directly by the people and for a term of office varying from one to six years, the present tendency being to extend his term of office. He has a large veto power, and is often given a very great power in appointing commissions, department heads, etc. The Mayor of New York, according to the recent charter, ruling the second largest city in the world and over more people than are contained in most States, has powers in many ways greater than those of the President of the United States. His powers are almost autocratic. The American mayor is often given very great discretionary powers, too, in enforcing legislation as to Sunday closing, etc. His salary, in the larger cities, reaches \$10,000. This policy of entrusting such large powers to the mayor is sometimes called a sink-or-swim policy. It gives a good mayor large opportunity, but it also gives the same to a bad mayor, and makes it very desirable for a corrupt machine to elect its man. It seems to be, on the whole, a step away from democracy. In Europe, where city government is much purer, the mayor has no such powers.

The work of administration in American cities is usually carried on by departments, often organized as boards or commissions. These are sometimes elected by the people, sometimes appointed by the legislature, sometimes appointed by the mayor—the tendency at present being to the latter method. They are usually disconnected; they are meant to be "non-partizan;" they become often the very center of "politics" and of jobs. As they control all the small offices, they can employ a great many of their "ring." The fact that they are often non-partizan and consist of three men gives one man very great power, because by siding with either other member of the commission he can swing the commission, and yet not be alone responsible. Education is usually treated as a distinct matter from the other departments, and the commissioners of education are more frequently elected by the people. The city legislature is usually composed of two houses, gen-

erally called a Board of Aldermen and a Common Council. Members of both houses are elected by the citizens, divided into wards, tho sometimes aldermen are elected on a "general ticket." Almost universally members of the Common Council must live in the wards they represent. Members of neither body are paid except in a few large cities, but often, if not usually, obtain large illicit revenues as "boodle aldermen" or corrupt councilors. They are elected usually at the same time and more often on the same platform as national and State officers, and usually on party lines. Municipal elections become thus mainly a squabble for party power, in which the machine and the ring flourish, and where the honest citizen is helpless. Nevertheless American cities, with rapid

Corruption. tion, are the most influential political bodies in the land. Municipal prizes are greater than national prizes. Hence the greater inducement to the corrupt, while the honest bestir themselves in vain.

For further details as to American cities, see MAYOR; FIRE DEPARTMENTS; POLICE; PARKS; TAXATION; WATER WORKS; GAS; ELECTRICITY; MUNICIPALISM; EDUCATION; BATHS; STREET RAILWAYS, etc.; also other sections of this article.

Municipal reform in Great Britain belongs mainly to the last 20 years, yet in a sense dates from the Scotch Municipal Government Act of 1833, and for England from the Municipal Reform Bill of 1835. These bills were consequent upon the great Reform Bill of 1832 reconstructing the Parliamentary boroughs. They admitted to burgess

Great Britain.

rights all property owners and all occupiers of rented property valued at £10 per annum. These remained substantially in force till the act of 1882 consolidated all acts bearing on the subject into one municipal code. By the Local Government Act of 1888, cities having over 50,000 inhabitants became distinct counties for administrative purposes. Under these bills and some special bills enlarging their functions England's towns exist to-day. Says Mr. Albert Shaw (*Municipal Government in Great Britain*, p. 30):

"The whole substance of British municipal government is condensed in the following clause:

"The municipal corporation of a borough shall be capable of acting by the council of the borough, and the council shall exercise all powers vested in the corporation by this Act or otherwise."

"All that the burgesses have to do is to elect the councilors, and they do the rest. Any burgess is eligible to the council. In addition, certain property and rate-paying qualifications admit to eligibility for the council those suburban who live beyond 7 but within 15 miles from the limits, yet have their business interests in the town. The councilors are elected for three years, and one third of them retire annually. The aldermen and mayor are an integral part of the council, the law stating specifically that 'the council shall consist of the mayor, aldermen, and councilors.' The aldermen 'shall be fit persons elected by the council.' They hold their office six years. They are one third as many as the councilors. The act declares

"A person shall not be qualified to be elected or to be an alderman unless he is a councilor or qualified to be a councilor. If a councilor is elected to, and accepts, the office of alderman, he vacates his office of councilor."

"Half the aldermen retire every three years. When the council confers aldermanic rank upon its own members, special elections in the wards fill the vacant councilorships.

"The clause relating to the choice of a mayor is as follows:

"The mayor shall be a fit person elected by the council from among the aldermen or councilors or persons qualified to be such."

The English franchise is very complicated and very different in different portions of the United Kingdom. The franchise is often different for Parliamentary, town council, school board, and parochial board elec-

tions. It turns on the household rather than the individual. Mr. Shaw says (*idem*, p. 45):

"The English municipal electorate excludes in practice nearly all the unmarried men, all floating laborers and lodging-house sleepers, and nearly all the serving class. Furthermore, in judging of the political effects of the extension of the franchise to the humblest householders, it must be borne in mind that the exploitation of the votes of the ignorant, vicious, and indifferent in English cities by demagogues or party agents is so extremely difficult that it does not count for anything at all in election results. The extraordinarily severe laws against bribery, direct and indirect, apply to municipal elections, and it is next to impossible to get a British voter to the polls who does not contemplate the contest with some glimmering of interest and intelligence. In Scotch towns the slums do not vote because they evade the rate-collector and are not registered. In English towns, altho registered by canvassers, they do not care about voting, and are a neglected field so far as political missionary work goes. The organized working men vote, of course; and they seem to vote with more intelligent and distinct purpose than any other class in the community. Of the women rate-payers nothing is to be said except that their voting is variable, sometimes being high in proportion to their numbers, and sometimes low, depending upon their interest in particular candidates or special issues. Their disposition to espouse party causes seems very marked, but it is not to be relied upon as unthinking or as oblivious of the qualities of candidates. Obviously, the franchise needs simplification, altho for municipal purposes it is difficult to see what desirable end would be gained by changing the principle from that of a household franchise to a personal one."

The English municipal council having large powers attracts to itself the best men. They receive no salaries, and the chances for profit through contracts or jobs are very remote. The position is one of high honor. Able men are continually reelected. Generally speaking, the mayoralty is conferred as an honor, the power lying not with the mayor, but with the council. Says Mr. Shaw (*idem*, p. 63):

"English, Scotch, and Irish municipal government is simply government by a group of men who are to be regarded as a grand committee of the corporation, the corporation consisting of the whole body of burgesses or qualified citizens.

In Glasgow it is a committee of 23; in Edinburgh, of 41; in Manchester, of 104; in Birmingham, of 72; in Liverpool, Leeds, Sheffield, and most of the large English towns, of 64; in Dublin, of 60; in Belfast, of 40; and in the other incorporated towns of the United Kingdom it varies from 12 to 64, according to their size. So far as these bodies have authority to pass bylaws at all, their authority is complete, and nobody obtrudes a veto. They appoint and remove all officials. They have entire charge of municipal administration, distributing the work of departmental management and supervision to standing committees of their own number, which they organize and constitute as they please. If such a local government cannot be trusted, the fault is with popular institutions. It is quite certain to be as good a government as the people concerned deserve to have. The location of responsibility is perfectly definite. When the Glasgow city improvement scheme became unpopular with the voters because it was proving more expensive than its projectors had promised, the chairman of the committee was retired by his constituents at the end of his term. The taxpayers hold every member of council responsible for his votes."

The most important office is that of clerk of the corporation, often a life position.

Municipal structure in Germany varies somewhat in different States and in different cities, yet has everywhere certain similar characteristics. In Prussia it is based on the Stein and Hardenburg reforms of the early part of the century.

The Prussian franchise, both in the municipalities and in the kingdom, is based upon a division of the population according to the taxes paid. The wealthiest class, which pays one third of the taxes, has one third of the suffrage. The middle class, which pays a second third of the taxes, has another third of the power; while the remaining third is left to the whole remainder of the population. In the constitution of the empire, however, and in many German cities outside of Prussia, the franchise is based on manhood suffrage as demanded by the revolutionists of 1848. In all cases

The Suffrage.

The Council.

Germany.

however, the city council (*Gemeindevath*) has the municipal power. Its members are usually elected for six years, one third going out of office every two years. The executive power is exercised by the burgomaster or mayor and a body of department chiefs, called magistrates. These are elected by the council, and have practically a life tenure. They are selected for expert knowledge and ability. A city will sometimes advertise for an experienced mayor. The magistrates are either highly salaried men or men of position who serve without salary. They form a council called the *Magistratsrath*. With this constitution in all German cities, the council, through the burgomaster and magistrates, conducts the city government as a father would a household. The city can do anything that it is not forbidden to do—the reverse of the American theory. It is supposed to do all that is necessary to the best interests of the community. The cities as a rule furnish their own water supply, gas, electric lighting. They strictly rule the running of the horse-cars, etc. They build and maintain baths, lavatories, abattoirs, markets, savings banks, pawn shops, etc. They care minutely and effectively for sewerage, street-paving, cleaning, and lighting. German cities provide systematically, too, for the relief of the poor. The cities are subdivided into districts, with a visitor for each. Workpeople must be insured by the municipalities or the State; compulsory education is provided at low rates; manual training and gymnastic drill is a part of the education. German cities are thus households, carefully watched, regulated, kept clean and healthful. Taxation is generally not high, no small portion of the municipal revenue coming from municipal activities or franchises, carefully sold at rates very favorable to the city corporation. (See also BERLIN.)

The French municipality is intimately connected with the old communes or townships, which in the early history of France won a high degree of local autonomy, and played no small part in the national history. (See FRANCE AND SOCIAL REFORM.)

France.

These ancient communes, however, had gradually lost all autonomy, and become but administrative parts of the absolutism of the Louis. The Revolution instantly liberated them, but under Napoleon they again became but units of his highly centralized system—a system, however, with some attempt at justice and freedom. Changing with the changes of France, the communes at present, under the third republic, have considerable local power, yet are by no means free from the control of the central government. The act of 1834, which is virtually the act under which they exist to-day, increases the local powers of the communes materially, yet leaving very much to be desired by the radicals and socialists, who in France, more than in most countries, center their ideals around the autonomy of the old communes. (See COMMUNE AND FRANCE.) According to the present system, some of these communes are municipalities, some of them rural townships. According to the present law, they are governed by a mayor, with his executive assistants, and a council. The council elects the mayor, and the council is elected by manhood suffrage in the communes. The councilors hold office for four years, and all retire together. The council holds four regular sessions a year, lasting from 15 days to six weeks, the mayor may call extra sessions. The council appoints consultative committees, but the mayor has all executive power with his assistants. He has the appointing power, subject to the approval of the prefect of the department, the representative of the central government. The council has large authority in the levying of taxes, voting of public works, etc., but usually subject to the approval of the department authorities.

Paris has in many ways less local autonomy than any other city in France. In the Revolution she gained her old communal freedom, and has at every revolution, but it was taken away by the various imperial governments, and has only been partially granted by the republic. Paris is largely still governed by the prefect of the department of the Seine, and his colleague, the prefect of the police. The city is divided into 23 arrondissements, and in each there is a central building called the *mairie*, the bureau of an officer called the *maire*. There is, however, a municipal council with considerable power, and the tendency is to develop municipal self-control.

III. STATISTICS OF CITIES.

The rapid growth of modern cities is one of the distinguishing notes of the century. It

holds true of all civilized countries. German cities are growing faster than American cities, except Chicago and a few smaller Western cities. Berlin is seven times as large as it was in 1830. The *Courier* of Hanover gives the following statistics:

New York.....	1870. 950,000	1890. 1,515,301
Berlin	1870. 800,000	1890. 1,579,244
<hr/>			
Boston.....	1875. 342,000	1890. 448,000
Hamburg.....	1875. 263,540	1890. 568,666
<hr/>			
Baltimore.....	1880. 332,312	1890. 434,439
Leipsic.....	1880. 127,000	1890. 357,147
<hr/>			
St. Louis.....	1880. 350,000	1890. 451,000
Munich.....	1880. 230,000	1890. 350,000
<hr/>			
Cincinnati.....	1880. 255,139	1890. 296,908
Breslau.....	1880. 272,900	1890. 335,186

This unhealthy growth of the German cities is all the more remarkable when we remember that Germany has to suffer much from emigration, while America profits by immigration. The natural consequence of this centralization is that the country districts are suffering from want of hands, while the cities are overburdened with the unemployed.

It is the same in France. Frederic Mistral describes the ill effects of this centralization in the *Temps*, Paris:

"All the intelligence of the country gathers in Paris, without returning to the provinces. France, one of the richest countries in the world, where grain, wine, oil, and beef are produced in superabundance, and which produces the best possible fighting material, seems destined to go under, because everything is done according to the routine prescribed by the capital. Much trouble is taken to colonize and improve foreign parts, while the French provinces are neglected. Much of the wealth which is gathered in Paris, both material and intellectual, is wasted, because no proper return is made to the provinces."

Mr. Albert Shaw says (*Municipal Government in Great Britain*, pp. 15-17): "While the entire increase of the French nation from the census of 1836 to the census of 1891 was less than 125,000, there was in those five years a growth of 340,000 in the aggregate population of the 56 largest cities and towns—those having more than 30,000 people. . . ."

"Urban population grows apace also in Holland and Belgium. One third of the Netherlands live in towns of 20,000 people or more, and a quarter of the Belgians are similarly grouped. In the 25 years from 1868 to 1893, the Holland towns of this class advanced from possessing exactly one fourth to exactly one third of the whole people. . . . In 30 years Rome and Milan have more than doubled their population; Florence has come little short of the same achievement; Turin and Genoa are about 70 per cent. larger than in 1864; overcrowded Naples has gained 100,000 people; Palermo has added nearly as many; and numerous large communes have gained 50 per cent."

Of the United Kingdom Mr. Shaw says (*idem*, pp. 12-15): "In Scotland, and the north of England especially, the change from rural to urban conditions has been revolutionary. At the beginning of the nineteenth century (census of 1801) the total population of Scotland was 1,600,000, and only a small proportion was made up of town dwellers. According to the census of 1891, the total population had grown to more than 4,000,000, of which only 928,500 were strictly rural. The town population was 2,631,300, and the villagers, forming an intermediate class, numbered 465,800. The rural population had declined absolutely in the 10 years from 1881, the decrease being 54 per cent., while in the previous 10 years, from 1871 to 1881, there had also been a loss of 4 per cent. The town population, on the other hand, had increased 18 per cent. from 1871 to 1881, and 14 per cent. from 1881 to 1891. . . . In England the Reform Act of 1835 dealt with 178 municipal corporations in England and Wales, and since that time, under Queen Victoria, 125 new charters of incorporation have been granted. By the census of 1891, the 178 old corporations had a total population of 5,483,000, and that of the 125 new corporations was 5,125,000. The population of England and Wales in 1891 was 29,000,000; and 11,000,000 people were living in 302 cities and towns

possessing full municipal governments. This does not include approximately 6,000,000 inhabitants of the 'Greater London,' or several million people who are in the suburban districts of large towns, or in communities living under urban conditions but not embraced within the present boundaries of municipal corporations. . . . One third of the whole population is now in towns of over 100,000 inhabitants, and nearly another third is in towns having from 10,000 to 100,000 people. For 20 years the growth of the towns having from 10,000 to 250,000 people has been at the average rate of 2 per cent. a year, or 20 per cent. a decade. Thus town life will soon prevail for three fourths of the English people."

The growth of cities in the United States is better known. "In 1790 one thirtieth of the population of the United States lived in cities of 8000 inhabitants and over; in 1800, one twenty-fifth; in 1810, and also in 1820, one twentieth; in 1830, one sixteenth; in 1840, one twelfth; in 1850, one eighth; in 1860, one sixth; in 1870, a little over one fifth; and in 1880, 22.5 per cent., or nearly one fourth. From 1790 to 1880 the whole population increased twelvefold, the urban population eighty-six fold. From 1830 to 1880 the whole population increased a little less than fourfold, the urban population thirteenfold. From 1870 to 1880 the whole population increased 30 per cent., the urban population 40 per cent. During the half century preceding 1880, population in the city increased more than four times as rapidly as that of the village and country. In 1800 there were only six cities in the United States which had a population of 8000 or more. In 1880 there were 286, and in 1890, 437."

The United States.

Says Dr. Strong in *The New Era*, p. 197: "In 1880 the number of our cities having a population of 8000 or more was 286; in 10 years the number had leaped up to 443. A hundred years ago we had but six. Between 1870 and 1890 the number of cities having a population of 100,000 or more doubled, rising from 14 to 28. In a number of States nearly all the increase of population from 1880 to 1890 was in the cities. Of the total increase in Maryland, the one city of Baltimore furnished fully nineteen twentieths." The following table gives a few cities among the many which made a very remarkable growth:

CITIES AND TOWNS.	POPULATION.		INCREASE. Per Cent.
	1880.	1890.	
Birmingham, Ala.....	3,086	26,178	748
Chicago, Ill.....	593,185	1,099,850	118
Dallas, Tex.....	10,358	38,067	267
Denver, Col.....	35,629	106,713	199
Duluth, Minn.....	3,483	33,115	850
El Paso, Tex.....	736	10,338	1,304
Kansas City, Kan.....	3,200	38,316	1,097
Seattle, Wash.....	3,533	42,837	1,112
Spokane Falls, Wash.....	359	19,922	5,592
Tacoma, Wash.....	1,098	36,006	3,179

Says the *Bulletin* on the social statistics of cities for the census of 1890: "While the older States—namely, those in the North Atlantic group—still lead in the number of cities and total population living therein, the North Central and Western groups have made large gains, the former having increased the number of cities 50, or 72.46 per cent., with an actual gain in population of 2,693,155, or 96.07 per cent., and the latter 13 cities, or 130 per cent., with an actual increase in population of 487,610, or 118.13 per cent."

"States that have made the most marked gains in their populations living in cities of this class are as follows: Nebraska, 438.87 per cent.; Minnesota, 265.71 per cent.; Oregon, 223.82 per cent.; North Carolina, 214.27 per cent.; Colorado 204.51 per cent.; Kansas, 194.79 per cent."

Says Dr. Strong (*The New Era*, p. 188): "If the rate of growth and movement of population from 1880 to 1890 continues until 1920, the city will then contain upward of 10,000,000 more than the country."

Th. *World Almanac* for 1895 prints the following statistics of populations:

CITIES.	Census Year.	Population.
London.....	1891	4,231,431
Paris.....	1891	2,447,957
New York*.....	1892	1,801,739
Canton.....	est.	1,600,000
Berlin.....	1890	1,579,244
Tokio, Japan.....	1890	1,380,684
Vienna.....	1890	1,364,648
Philadelphia (municipality).....	1892	1,144,653
Chicago.....	1890	1,099,850
St. Petersburg.....	1889	1,003,310
Pekin.....	1,000,000
Brooklyn (State)*.....	1892	957,163
Constantinople.....	1885	873,566
Calcutta.....	1891	840,130
Brooklyn.....	1890	806,340
Bombay.....	1891	804,470
Rio de Janeiro†.....	1892	800,000

Concerning the density of population in cities, the census *Bulletin* for 1890 (see above) gives it for American cities as follows:

CITIES.	Popula- tion.	Square Miles.	POPULATION TO	
			Each Square Mile.	Each Acre.
New York.....	1,515,301	40.22	37,675.31	58.87
Chicago.....	1,099,850	160.57	6,849.66	10.70
Philadelphia.....	1,046,964	129.39	8,091.54	12.64
Brooklyn.....	806,343	26.46	30,474.04	47.62
St. Louis.....	451,770	61.35	7,363.81	11.51
Boston.....	448,477	35.28	12,711.93	19.86
Baltimore.....	434,439	28.38	15,307.93	23.92
San Francisco.....	298,997	15.46	19,340.04	30.22
Cincinnati.....	296,908	25.00	11,876.32	18.56
Cleveland.....	261,353	24.88	10,504.54	16.47

According to Mulhall (1892), the density of population was, for London, 52 per acre; Paris, 154; Vienna, 258; Berlin, 264.

This, however, gives little idea of the overcrowding in certain portions of cities. Thus the average population in New York City per acre is 58.87, but in Ward 10 of that city it rises to the Overcrowd-
frightful number of 478 to the acre. ing.

Says Edward Marshall in the *North American Review* for December, 1893:

"Six small down-town wards may with confidence be spoken of as forming the most crowded spot on earth. No obtainable statistics of English or continental cities show a population approaching that of this district of New York. . . . The population per square mile of these six wards was given in 1890 as—

Seventh.....	197,200
Tenth.....	357,888
Eleventh.....	262,720
Thirteenth.....	295,104
Fourteenth.....	198,272
Seventeenth.....	252,834

"This is an average for the whole district of 252,834 to the square mile. Even the lowest of these figures shows a higher population than occurs anywhere else; and the population of the Tenth Ward to any given area is more than twice that credited to the most thickly populated district of old London, where 175,816 people to the square mile dwell. . . . Several con-

* New York State census of 1892. The population of the territory embraced within the limits of "Greater New York," as proposed by the commission, is over 3,000,000. † A school census taken in Chicago in 1892 revealed an estimated population of upward of 1,400,000. ‡ Official estimate.

tinental cities contain more crowded districts than London ever did, but none approach the terrifying congestion of our 'teaming Tenth.'" Related to density of population, largely as effect to cause, is the death-rate of cities. According to the above-mentioned census *Bulletin*, the death-rate of American cities is as follows:

CITIES.	Number of Persons per Acre.	Approximate Death-Rate for Census Year.
Newark	16	29.2
New York.....	59	28.6
New Orleans.....	10	28.4
Washington.....	31	25.8
Brooklyn.....	48	25.5
Boston.....	20	24.8
Baltimore.....	24	24.7
Denver.....	11	24.2
San Francisco.....	30	23.6
Philadelphia.....	13	22.6
Cincinnati.....	19	22.3
Cleveland.....	16	21.9
Chicago.....	11	21.1
Detroit.....	16	20.4
Buffalo.....	10	19.9
Milwaukee.....	19	19.3
St. Louis.....	12	19.1
Indianapolis.....	16	18.8
St. Paul.....	4	16.7
Minneapolis.....	5	14.8

In crowded wards it is much higher, says the *Bulletin*. Taking the three most densely populated wards in Boston, Chicago, and Cincinnati, and comparing them as to death-rates with the three least densely populated wards in each of the above cities, the following results are obtained:

CITIES.	Wards.	Average Number of Persons per Acre.	Average Death-Rate.
Boston.....	8, 9, 16	166	29.40
Boston.....	23, 24, 25	4	18.61
Chicago.....	5, 16, 19	98	22.20
Chicago.....	27, 31, 33	1	16.90
Cincinnati.....	7, 10, 13	53	29.90
Cincinnati.....	1, 29, 30	3	18.17

According to Mulhall (1890), the death-rate (1878-80) in London was 21.1; Berlin, 27.6; Glasgow, 25.3; Birmingham, 19.8; Paris, 28.6; Manchester, 25.5. According to A. R. Conkling, however (*City Government in the United States*, 1894), Berlin has reduced her death-rate to about 20.

Coming to the statistics of municipal finances, census *Bulletin* No. 82, prepared by Mr. J. K. Upton, gives us the fullest information, reporting in detail as to 100 out of 443 cities in the United States, having a population of 8000 or upward. We take from it the following tables:

TOTAL RECEIPTS AND EXPENDITURES OF 100 PRINCIPAL OR REPRESENTATIVE CITIES OF THE UNITED STATES.

RECEIPTS.		EXPENDITURES.	
Taxes.....	\$139,283,226	Libraries.....	\$818,202
Special assessments, streets and bridges.....	13,206,035	Schools.....	26,198,173

Licenses } Liquor.....	11,782,307	Health.....	2,280,317
} Other.....	3,411,539	Lighting.....	7,747,313
Fees, fines, and penalties.....	2,714,404	Police.....	17,817,435
Waterworks.....	18,826,269	Charitable objects.....	7,166,991
Interest on deposits.....	575,957	Streets and bridges.....	33,580,299
Income from funds and investments.....	10,852,461	Sewers.....	6,943,519
Miscellaneous.....	12,889,033	Buildings and improvements.....	9,715,079
		Parks and public grounds.....	12,672,464
		Salaries.....	11,823,458
		Waterworks.....	19,086,751
		Interest on debt.....	32,250,368
		Miscellaneous.....	34,651,043
Total ordinary receipts.....	\$215,001,448	Total ordinary expenses.....	\$234,626,655
Loans.....	84,352,668	Loans.....	59,488,191
Funds and transfers.....	18,381,673	Funds and transfers.....	28,330,353
From State or county.....	5,443,947	Balance, cash on hand end of year.....	36,579,193
Balance, cash on hand beginning of year.....	35,844,656		
Grand total.....	\$359,024,392	Grand total.....	\$359,024,392

Comparing detailed amounts expended by cities with those expended by States, the magnitude of municipal expenditures is clearly exhibited.

Omitting amounts on account of loans, transfers, and funds, the ordinary expenditures of the State of Massachusetts for the year ending December 31, 1889, as compiled by this office, was \$4,955,669. With like omissions, the expenditures for the city of Boston for the year named amounted to \$16,117,043. Like ordinary expenditures of the States of New York, Massachusetts, Pennsylvania, Ohio, Missouri, and Illinois, the six largest States in the Union in population, for one year amounted in the aggregate to \$28,850,010, while in the same period the ordinary expenditures of New York City alone amounted to \$48,937,604. The State of New York expended in 1889, for legislative, executive, and judicial purposes, \$1,619,127, an amount considerably exceeding like expenditures in any other State; but the amount for the same period paid for salaries alone for such purposes in certain cities was as follows: New York, \$3,488,834; Brooklyn, \$2,325,684; Philadelphia, \$1,131,376.

The approximate administrative expenditures include that part of the ordinary expenditures presumed to be necessary for the conduct of ordinary city affairs. To determine the amount there has been deducted in each case from the ordinary expenditures of the city the amount expended for libraries, schools, public buildings, charitable objects, and waterworks or use of water.

The expenditures on account of construction of new streets, bridges, and sewers, and for the purchase and opening of new grounds for parks and places, could not in many cases be separated in the reports from those incurred for the maintenance of such works and grounds already in use. No deduction of their amount could therefore be made in ascertaining the ordinary expenses of administration, as otherwise would have been done. Expenditures for such purposes, it is thought, were unusually large in the cities of New York, Chicago, Philadelphia, St. Paul, St. Louis, and San Francisco for the years reported.

TOTAL AND PER CAPITA ORDINARY AND ADMINISTRATIVE EXPENDITURES AND RECEIPTS.

Concerning the debts of American municipalities, Mr. Conkling (*City Government of the United States*, p. 170) says:

"A table of the increase of population, taxable valuation, taxation and debt in 15 of the chief cities of the United States, from 1866-75, is as follows:

Increase in population.....	70.5 per cent.
Increase in tax valuation.....	156.9 per cent.
Increase in debt.....	270.9 per cent.
Increase in taxation.....	363.2 per cent.

"The increase in debt has been most notable in the large cities.

"The sudden increase of the debt of New York during the reign of the Tweed ring is, perhaps, the most remarkable of any large city. During the two years preceding the downfall of that ring in 1871 the increase of the city's debt was \$40,650,648. On July 1, 1894, the net funded debt of New York City was \$104,339,634, and the State of New York is practically out of debt.

"A city having a low rate of taxation has often a large bonded debt.

"The tax-rate of cities is often a delusion and a snare, for the reason that, where the municipal authori-

ties refuse to make an appropriation, application is made to the Legislature for authority to issue bonds. This method of financial juggling is adopted in the city of New York.

"The city of Chicago is about to reissue at 4 per cent. \$1,787,000 worth of bonds that have borne interest at 7 per cent.

"Many of the small cities in the United States are now selling bonds at the rate of 4 and 5 per cent. These bonds are sometimes exempted from municipal taxation. In the District of Columbia registered bonds, guaranteed by the United States Government and bearing interest at 3.65 per cent., have been issued recently. The issue is limited to \$5,000,000, and is exempt from all taxes. The city bonds in several Western States are fair investments, because the city debt is limited by the State Constitution to 5 per cent. of the assessed valuation of the taxable property."

The *World Almanac* for 1895 gives the following statistics of municipal debts and tax rates in the United States, as furnished by the mayors of the respective cities:

Debts.

CITIES.	Estimated Population, January 1, 1895	Net Public Debt.	Assessed Valuation of All Taxable Property.	Per cent. of Actual Value*	Tax Rate.†
Baltimore, Md.....	512,358	\$34,100,475	\$300,000,000	75	1.70
Boston, Mass. (a).....	500,000	35,017,910	924,093,752	100	1.28

Washington, D.C.....	280,000	19,138,238	203,505,092	40	1.50

* This is the percentage of assessment upon actual valuation. † Tax on each \$100 of assessed valuation. (a) Report of December, 1893. (b) About 10 per cent. (c) Approximate.

Mr. J. J. O'Meara (*Municipal Taxation at Home and Abroad*, 1894, pp. 26, 27) gives the following statistics for Europe:

CITIES.	Population.	Debt.	Per Capita.
Birmingham.....	478,113	£10,388,413	£21 14s. 6d.
London County Council.....	4,232,118	39,621,813	7 4 8
Glasgow.....	656,185	6,718,516	10 4 7
Manchester.....	515,567	10,399,145	20 3 4
Paris.....	2,447,957	76,490,920	31 4 11

Concerning the expenditures of cities, Mr. A. R. Conkling (*idem.*, p. 174) gives the following table:

CITIES.	Expenditure	Population.
London.....	\$58,446,000	5,100,000*
Paris.....	66,000,000	2,480,000
Berlin.....	21,150,000	1,670,000
Vienna.....	11,868,000	1,423,000
New York†.....	38,664,257	1,610,108‡
Chicago.....	32,426,210	1,098,576
Philadelphia.....	23,061,526	1,044,894
Boston.....	10,647,928	446,507

* In 1890.
 † Excluding about \$3,500,000 for improvements by assessments and by the issue of bonds.
 ‡ The mean of the federal and public census.

The cost of government *per capita* is in London, \$11.46; in Paris, \$26.61, and in Berlin, \$11.97. In the city of New York the rate was \$5 in 1850. At the end of Tweed's administration, in 1871, it was \$18.66; and in 1893, excluding the expenditure for assessments, it was \$24.01.

Finances.

In Europe large revenues are received from municipal activities, franchises, etc. Mr. Leroy Beaulieu believes that in the near future the great source of city revenues will be public halls, markets, slaughter-houses, gas-works, public conveniences, etc. (See the comparative table on the next page.)

Mr. J. J. O'Meara (*Municipal Taxation at Home and Abroad*, Appendix II.) gives the following statistics for 1891. An analysis of these tables will show that the larger cities of Europe apparently carry heavier municipal debts than are borne by the larger cities of the United States; but the analysis will also show that this is only apparently the case. If the European cities have larger debts, they have larger assets. They have largely borrowed for permanent investments that pay the interest on the money borrowed. American cities too often borrow to pay running expenses.

CITIES.	Total Receipts.	Assets.	Taxes.	Other Sources.
Birmingham	£1,398,080	£262,872	£380,532	£754,576
London County Council.....	2,500,618	95,829	1,692,551	712,238
Manchester	1,372,839	850,394	506,317	16,308
Glasgow.....	1,580,053	477,650	1,102,403

* In these columns, municipal ownership and operation is marked 100; municipal ownership and private operation is marked 50. † This is receipts.

It appears from this table that the larger American cities, compared with the leading European cities, altho not so crowded, have a higher death-rate, cost their citizens twice as much money, tax their citizens more than three times as much, furnish less park area, and spend a smaller proportion of their receipts for education. American cities seek a large proportion of their receipts from taxes; European cities receive a large share of their receipts from municipal enterprises and assets of one kind or another, her cities leading in the municipalization of gas, surface railroads, improved tenements, baths, etc. America leads in municipal water works, the one large municipal activity, which in few cities is depended upon for revenue. In all revenue-producing municipalism Europe leads. From such a table it is easy to see how American cities lead in taxes and in death-rate, European cities in health and municipalization.

IV. THE NEED OF REFORM.

(a) In America.

Says Mr. James Bryce (*American Commonwealth*, vol. i., p. 608) :

"There is no denying that the government of cities is the one conspicuous failure of the United States. The deficiencies of the national Government tell but little for evil on the welfare of the people. The faults of the State governments are insignificant compared with the extravagance, corruption, and mismanagement which mark the administrations of most of the great cities. For these evils are not confined to one or two cities. The commonest mistake of Europeans who talk about America is to assume that the political vices of New York are found everywhere. The next most common is to suppose that they are found nowhere else. In New York they have revealed them-

selves on the largest scale. They are 'gross as a mountain, open, palpable.' But there is not a city with a population exceeding 200,000 where the poison germs have not sprung into a vigorous life; and in some of the smaller ones, down to 70,000, it needs no microscope to note the results of their growth."

Says Mr. Andrew D. White (*The Forum*, December, 1890) : "Without the slightest exaggeration we may assert that, with very few exceptions, the city governments of the United States are the worst in Christendom—the most expensive, the most inefficient, and the most corrupt. The city halls of these larger towns are the acknowledged centers of the vilest corruption. They are absolutely demoralizing, not merely to those who live under their sway, but to the country at large. Such cities, like the decaying spots on ripe fruit, tend to corrupt the whole body politic. As a rule, the men who sit in the councils of our larger cities dispensing comfort or discomfort, justice or injustice, beauty or deformity, health or disease, to this and to future generations, are men who in no other country would think of aspiring to such positions. Some of them, indeed, would think themselves lucky in keeping outside the prisons. . . . Few have gained their positions by fitness or by public service; many have gained them by scoundrelism; some by crime. . . . It has been my lot also to have much to do with two interior American cities of less size—one of about 100,000 inhabitants, the other of about 12,000. In the former of these, I saw a franchise for which \$1,000,000 could easily have been obtained, given away by the common council. I saw a body of the most honored men in the State go before that council to plead for ordinary justice and decency. I saw the chief judge of the highest court of the State, one of his associate judges, a circuit judge of the United States, an honored member of Congress, two bishops, the president and professors of a university, and a great body of respected citizens

Municipal Corruption.

urge this common council not to allow a railway corporation to block up the entrance to the ward in which the petitioners lived, and to occupy the main streets of the city. They asked that, if it were allowed to do so, it might be required, in the interest of human life, either to raise its tracks above the streets or to protect the citizens by watchmen and gateways, and to pay a fair sum for the privilege of cutting through the heart of a populous city. All was utterly in vain. I saw that common council, by an almost unanimous vote, pass a bill giving away to this great corporation all this franchise for nothing, so far as the public knew, and without even a requirement to protect the crossings of the most important streets; and I soon afterward stood by the mutilated body of one of the noblest of women, beheaded at one of these unprotected street crossings while on an errand of mercy. So, too, in the smaller of these two interior cities, while the sewerage and the streets were in such bad condition as to demand the immediate attention of the common council, I saw the consideration of these interests neglected for months, and the main attention of the council given to a struggle over the appointment of a cemetery-keeper at a salary of \$10 a week.

Says Mr. A. R. Conkling (*City Government in the United States*, pp. 9, 10): "The character of the average city legislator is well known to those who come in contact with him; but for the benefit of the closest student of American municipal government, I give an extract from a non-partisan report on the representatives of the city of New York in the Legislature. The description will generally apply to the aldermen of American cities. *The Eighth Annual Record of Assemblymen and Senators from the City of New York*, published by the City Reform Club, referring to a very prominent assemblyman, says: 'He received six or seven years' schooling in the public schools of this city. His early associations were not good. He was employed in various newspaper delivery offices for several years. He afterward became a liquor-dealer, then an undertaker, then a liquor-dealer again. Last year he called himself a lawyer, and this year a plumber. As a matter of fact, he has recently opened a new saloon at 35 — Street. He does not use tobacco, nor drink intoxicating liquors. . . . He belongs to the worst class of barroom politicians. He has engaged in street brawls, poses as a fighter, and is a typical New York 'tough.' As a legislator he is preposterous. He is dishonest, and has been accused upon the floor of the House of using money to defeat certain bills. . . . Altogether he is perhaps the most dangerous man that the city has ever sent to Albany.' Another assemblyman is thus described: 'He was born in New York City, of American parents. He was educated in the public schools and was admitted to the bar. . . . He had no conception of his duties, and seemed lacking in ordinary intelligence. . . . He associated with and followed the lead of the most corrupt element in the Legislature.'

In 1876 New York State appointed a commission, with W. M. Everts as Chairman, "to devise a plan for the government of cities in the State of New York." It summed up the present evils as follows:

"1. The accumulation of permanent municipal debt: In New York it was, in 1840, \$10,000,000; in 1850, \$12,000,000; in 1860, \$18,000,000; in 1870, \$27,000,000; in 1876, \$113,000,000."

The commission adds: "The magnitude and rapid increase of this debt are not less remarkable than the poverty of the results exhibited as the return for so prodigious an expenditure. It was abundantly sufficient for the construction of all the public works of a great metropolis for a century to come, and to have adorned it besides with the splendors of architecture and art. Instead of this, the wharves and piers are for the most part temporary and perishable structures; the streets are poorly paved; the sewers in great measure imperfect, insufficient, and in bad order; the public buildings shabby and inadequate; and there is little which the citizen can regard with satisfaction, save the aqueduct and its appurtenances and the public park. Even these should not be said to be the product of the public debt; for the expense occasioned by them is, or should have been, for the most part, already extinguished. In truth, the larger part of the city debt represents a vast aggregate of moneys wasted, embezzled, or misapplied.

"2. The excessive increase of the annual expenditure for ordinary purposes." In 1816 the amount raised by taxation was less than one half per cent. on the taxable property; in 1850, 1.13 per cent.; in 1860, 1.69 per cent.; in 1870, 2.17 per cent.; in 1876, 2.67 per cent. "The increase in the annual expenditure since 1850, as compared with the increase of population, is more

than 400 per cent., and as compared with the increase of taxable property, more than 200 per cent."

The commission suggest the following as the causes:

"1. Incompetent and unfaithful governing boards and officers.

"2. The introduction of State and national politics into municipal affairs.

"3. The assumption by the Legislature of the direct control of local affairs."

Concerning this last cause, the commission says:

"It may be true that the first attempts to secure legislative intervention in the local affairs of our principal cities were made by good citizens in the supposed interest of reform and good government, and to counteract the schemes of corrupt officials. The notion that legislative control was the proper remedy was a serious mistake. The corrupt cliques and rings thus sought that were baffled were quick to perceive that in the business

Causes of Corruption.

of procuring special laws concerning local affairs they could easily outmatch the faithful and clumsy labors of disinterested citizens. The transfer of the control of the municipal resources from the localities to the (State) capitol had no other effect than to cause a like transfer of the methods and arts of corruption, and to make the fortunes of our principal cities the traffic of the lobbies. Municipal corruption, previously confined within territorial limits, thenceforth escaped all bounds and spread to every quarter of the State. Cities were compelled by legislation to buy lands for parks and places because the owners wished to sell them; compelled to grade, pave, and sewer streets without inhabitants, and for no other purpose than to award corrupt contracts for the work. Cities were compelled to purchase, at the public expense, and at extravagant prices, the property necessary for streets and avenues, useless for any other purpose than to make a market for the adjoining property thus improved. Laws were enacted abolishing one office and creating another with the same duties in order to transfer official emoluments from one man to another, and laws to change the functions of officers with a view only to a new distribution of patronage, and to lengthen the terms of offices for no other purpose than to retain in place officers who could not otherwise be elected or appointed."

Concerning the second cause suggested by the commission, Mr. Henry C. Lea makes the following scathing indictment: "The most dangerous enemies of reform are not the poor men or the ignorant men, but the men of wealth and position, who have nothing to gain from political corruption, but show themselves as unfitted for the right of suffrage as the lowest proletarian, by allowing their partisanship to enlist them in the support of candidates notoriously bad, who happen, by control of the party machinery, to obtain the regular nominations." (See RINGS.)

This, however, by no means exhausts all the causes of municipal corruption. Of another potent cause Mr. Francis Bellamy says: "Another cause of municipal misgovernment is the uncertainty of responsibility, especially in its executive branches. Various departments, which should work in closest harmony, owe their appointment to as many different authorities; and often not only do not cooperate, but actually pursue cross purposes. At one time Philadelphia was found to be possessed by four boards with power to tear up the streets at will, but none whose duty it was to see that they were properly relaid. Or here is an example of a composite officialdom which may happen any day: a 'citizens' ticket' mayor, a Republican street commissioner, both elected by the people; other appointments filled by men acceptable to a Democratic Board of Aldermen; a police commission named by the governor, together with the State Legislature interfering on occasion. With such a mixture it is not easy to fix responsibility for maladministration. Non-partisan commissions of four members, two from each party, is another favorite and specious arrangement by which the people are prevented from calling either party to account. This non-partisan contrivance is also an open door for the most unblushing division of spoils in the department between the 'workers' of both parties. . . . It is imperative that responsibility be defined and located. The people must know where the trouble lies, and whom to call to account when things go wrong. There must no longer be a dissipation of responsibility between mayor and aldermen and councilmen, and then through executive commissions, for whose composition and actions no one can be held strictly accountable. The people of Boston, for instance, do not know [the charter has been now changed.—Ed.] where to lay the blame for many

municipal disorders. Mayor and street commissioner, school board, and the two chambers are elected by the people. Treasurer, and auditor, superintendent of the streets, and 104 other officials are appointed by mayor and aldermen together. There are 40 distinct executive departments which depend on mayor and aldermen. The police department is controlled by the governor and his council. The State also appoints a fire marshal to investigate fires, while the city-appointed firemen put them out. The various departments are headed by commissions of three or five men, and by another ingenious contrivance, these men are appointed by the mayor singly, only one each year; so that the mayor can never control any commission of three until his second year, nor any commission of five until his third year, if he lasts so long. But these are not all the obstacles the people meet in finding out who is accountable. If seven of the 12 aldermen are not in sympathy with the mayor, they can, by dictations or bargains, put such a restriction on his appointments that he finds himself without control of the executive departments of which he is the nominal head. It is indeed, as an English journal said, 'the craftiest combination of schemes to defeat the will of democracy ever devised in the world.'

Still another cause, and many believe the prime cause, why American city government is so corrupt, and particularly why so few of our best citizens incline to take office, is the low sphere given in America to municipal activities. In the progressive cities of Europe, the city undertakes large, important functions. In America these are carried on by private corporations. These corporations pay many times the salaries paid to most city officials. Is it any wonder that they can get the best men, and the cities the worst? The municipality is made the tool of the corporations. But nevertheless the corporations get their franchises from the city, and are affected by legislation; hence, it pays them to "influence" the low set of politicians to whom we have left our municipal government. Is it any wonder that corruption results? Says Mr. Francis Bellamy:

"Why is the municipal government of Berlin or Birmingham or Glasgow so much less corrupt and more efficient than ours? Certainly not because their citizens are more intelligent or more moral than Americans. One reason certainly is that the machinery is more simple and direct. But the deepest reason

Corporation Influence.

is that the functions are so much more extensive that not only are the most capable men led to take office, but the people generally are attentive to the problems which the many-sided business of the city presents.

"If it is objected that monopolies should be kept out of politics, we can only reply that monopolies are in politics. They depend on legislatures and city councils and on politicians and lobbyists for their very existence. Private monopolies have debauched our politics, and are a continual menace to uncorrupted government. Our recent West End Railway scandal in Boston is only less than the Broadway Surface bribery of New York aldermen; but both go to show how terrible is the pressure which great natural monopolies can bring to bear to extort franchises. The interests of such immense enterprises as elevated railways, surface railways, gas works, electric lighting plants, and water works are necessarily antagonistic to the interests of the public. They serve the people, but their motive is dividends, and not the comfort of the people or the improvement of the city. They absorb the best business talent and the best legal shrewdness into their service, that they may secure privileges at public sacrifice. They employ a candidate for Governor of Massachusetts to defeat in legislative committee the natural petition of Danvers town people that they may be allowed to do their own electric lighting. And they employ an ex-Governor of Massachusetts to lobby for the passage of an elevated railroad bill, which gives fullest freedom to the company without the public receiving a dollar of compensation. Monopolies will be in politics in a bad sense until the people take them into politics in a good sense by undertaking their operation themselves. In this way, too, municipal reform is more apt to follow extension of the city's business than to go before it.

"Connected with this cause of municipal mismanagement is the irresoluteness and indifference of the people themselves. Some are apathetic. It has been estimated that the stay-at-home vote at city elections amounts to one fourth of the number of registered voters. This stay-at-home vote carries the balance of power. It carries also hidden in its pocket the power of rebuke for misgovernment, for it is composed of the

more intelligent of the citizens. There is not so much to fear from the Irish vote or the German vote as from this absentee vote. The foreign vote is susceptible of disintegration; it may negative itself. But the abstaining vote is solid against good government. At intervals, after some particularly atrocious conduct, this vote is invaded by indignation, and some fraction of it shakes off its languor and makes itself felt at the polls. But it is only a spasm. It is the rush of raw volunteers against regulars. The regulars may be broken, but they can wait. Their turn will come again presently. Meanwhile, the stay-at-homes return to their habit, imagining that by earnestly doing their duty for two or three years they have conquered the power of corruption, and that it is not necessary to continue the fight till it is driven from the field."

All the needs of city reform, however, are by no means confined to political evils (for the evils of overcrowding, etc., see SLUMS; TENEMENTS, etc.); but these must not be forgotten in thinking of municipal conditions. Eighty per cent. of New York City's population live in tenements; only 33 per cent. in Boston own the houses they live in. Of those occupying hired houses, only 16% live in single tenements; the rest crowd together in tenements of two or more families. Of slum life, the author of *Socialism and Christianity* says (p. 205):

"Think of a plot of ground 200 feet square providing a permanent home for nearly 600 persons, giving to each a space of 8 feet by 9! But even so scanty a provision is palatial when the facts are more closely examined. Sixteen families composed of 80 persons in a single 25-foot dwelling are common. . . . In a room 12 by 8 and 5½ feet high inspected in 1879, it was found that nine persons slept and prepared their food. . . .

City Poverty.

In another room, located in a dark cellar, without screens or partitions, were huddled together two men with their wives and a girl of 14, two single men and a boy of 17, two women, and four boys, 9, 10, 11, and 15 years old—fourteen persons in all.

But this is only one half of the picture. Not only do we have this terrible poverty in our cities, but we have it close by the side of extreme wealth. Says Dr. Josiah Strong:

"It is the city where wealth is massed; and here are the tangible evidences of it piled many stories high. Here the sway of Mammon is widest, and his worship the most constant and eager. Here are luxuries gathered—everything that dazzles the eye or tempts the appetite; here is the most extravagant expenditure. Here, also, is the congestion of wealth the severest.

How are such items as the following, which appeared in the papers of January, 1880, likely to strike discontented laborers? 'The profits of the Wall Street kings the past year were enormous. It is estimated that Vanderbilt made \$30,000,000; Jay Gould, \$15,000,000; Russell Sage, \$10,000,000; Sidney Dillon, \$10,000,000; James R. Keene, \$8,000,000; and three or four others from \$1,000,000 to \$2,000,000 each; making a grand total for 10 or 12 estates of about \$80,000,000.'

It is these terrible contrasts which form a large part of the problem of the city.

When the unemployed, sleeping in crowded tenements, in police stations, in empty wagons, under the shelter of some friendly roof, go out, with little or no breakfast, to look for work; when, after a long day's fruitless search, they return to pale-faced wives and hungry children, one can scarcely wonder that they grow weary and discouraged, reckless and desperate; but when, in addition to this, they pursue their search for bare existence along streets lined with palaces groaning with superabundance, one wonders that anarchy does not arise in every modern city; one admires the self-control and patience of the poor.

Connected with these contrasts is the composite character of our city populations.

Though only about one third of the population of the United States is foreign by birth or parentage, this element rarely constitutes less than two thirds of our larger cities, and often more than three fourths.

Charity attempts relief, but the foremost charity workers (see CHARITY ORGANIZATION) are declaring to-day that the misery increases faster than charity can relieve it. The amounts spent annually for poor relief, private or public, in England and America is very many millions; yet the need is greater still. Perhaps, more exactly, the need is for new conditions that shall make charity less necessary. To-day misery and affluence, the beggar and the capitalist, the prostitute and the millionaire exist side by side.

The following is a table of the nationality of some of the larger American cities, according to the census of 1890:

CITIES.	Total Foreign Born.	British-Americans.	Irish.	English.	Scotch.	Germans.	Austrians.	French.	Italians.
New York.....	630,943	8,398	190,418	35,907	11,242	210,723	27,193	10,535	39,951

Cincinnati, O.....	978	120	28	227	9	99	41	16	24

Connected with this foreign population of our cities is the saloon problem. Says Dr. Josiah Strong (*Our Country*, pp. 181 and 133):

"East of the Mississippi there was, in 1880, one saloon to every 438 of the population; in Boston, one to every 329; in Cleveland, one to every 192; in Chicago, one to every 179; in New York, one to every 171; in Cincinnati, one to every 124. Of course the demoralizing and pauperizing power of the saloons and their debauching influence in politics increase with their numerical strength. . . . The liquor trade boasts that in New York City alone it controls 40,000 votes. That the saloons are the great centers of political activity is evident from the fact that out of 1002 primary and other political meetings held in New York during the year preceding the November election of 1884, 633 were held in saloons and 86 were held next door to saloons, while only 283 were held apart from them. These saloons and their keepers are controlled by a few strong men. In 1888, the saloons in New York City, 4710 were subject to chattel mortgages, which aggregated \$4,959,578 in value. An overwhelming proportion of these mortgages were held by brewers, one firm holding upward of 200, and another 600; which being interpreted means that two firms controlled upward of 800 centers of political influence in New York."

Intemperance.

Such are some of the evils connected with American cities. (See also PROSTITUTION; GAMBLING; UNEMPLOYMENT; PAUPERISM; CRIME; SLUMS, etc.).

(b) *Europe.*

The evils of modern city life are by no means confined to American cities.

Said Professor Huxley (*Social Diseases and Worse Remedies*): "Any one who is acquainted with the state of the population of all great industrial centers, whether in this or other countries, is aware that, amid a large and increasing body of that population, *la misère* reigns supreme. . . . I have no pretensions of the character of a philanthropist, and I have a special horror of all sorts of sentimental rhetoric; I am merely trying to deal with facts, to some extent within my own knowledge, and further evidenced by abundant testimony, as a naturalist; and I take it to be a mere plain truth that throughout industrial Europe there is not a single large manufacturing city which is free from a vast mass of people whose condition is exactly that

described, and from a still greater mass who, living just on the edge of the social swamp, are liable to be precipitated into it by any lack of demand for their produce. And, with every addition to the population, the multitude already sunk in the pit and the number of the host sliding toward it continually increase."

What Professor Huxley means by *la misère* is apparent when he says (*idem*): "It is a condition in which the food, warmth, and clothing which are necessary for the mere maintenance of the functions of the body in their normal state cannot be obtained; in which men, women, and children are forced to crowd into dens wherein decency is abolished and the most ordinary conditions of healthful existence are impossible of attainment; in which the pleasures within reach are reduced to bestiality and drunkenness; in which the pains accumulate at compound interest, in the shape of starvation, disease, stunted development, and moral degradation; in which the prospect of even steady and honest industry is a life of unsuccessful battling with hunger, rounded by a pauper's grave."

What life in London means for hundreds of thousands can be seen by the following from *The Bitter Cry of Outcast London*, speaking of London's tenements: "To get into them you have to penetrate courts reeking with poisonous and malodorous gases, arising from accumulations of sewage and refuse scattered in all directions, and often flowing beneath your feet; courts, many of them which the sun never penetrates, which are never visited by a breath of fresh air. You have to ascend rotten staircases, grope your way along dark and filthy passages swarming with vermin. Then, if you are not driven back by the intolerable stench, you may gain admittance to the dens in which these thousands of beings herd together. Eight feet square! That is about the average size of very many of these rooms. Walls and ceiling are black with the accretions of filth which have gathered upon them through long years of neglect. It is exuding through cracks in the boards; it is everywhere. . . . Every room in these rotten and reeking tenements houses a family, often two. In one cellar, a sanitary inspector reports finding a father, mother, three children, and four pigs. . . . Here are seven people living in one underground kitchen, and a little dead child lying in the same room. Elsewhere is a poor widow, her three children, and a child who had been dead 13 days. Her husband, who was a cabman, had shortly before committed suicide. . . . In another apartment, nine brothers and sisters, from 29 years of age downward, live, eat, and sleep together. Here is

London.

a mother who turns her children into the street in the early evening, because she lets her room for immoral purposes until long after midnight, when the poor little wretches creep back again, if they have not found some miserable shelter elsewhere. Where there are beds, they are simply heaps of dirty rags, shavings, or straw; but for the most part these miserable beings find rest only upon the filthy boards. . . . There are men and women who lie and die, day by day, in their wretched single room, sharing all the family trouble, enduring the hunger and the cold, and waiting, without hope, without a single ray of comfort, until God curtails their staring eyes with the merciful film of death."

Nor is this condition true only of a few worst slums. As regards the 4,000,000 of persons in the metropolis, Mr. Charles Booth tells us that 37,610, or 0.9 per cent., are in the lowest class (occasional laborers, loafers, and semi-criminals); 316,834, or 7.5 per cent., in the next (casual labor, hand-to-mouth existence, *chronic want*); 938,293, or 22.3 per cent., form "the poor" (including alike those whose earnings are small, because of irregularity of employment, and those whose work, though regular, is ill-paid). These classes, on or below the "poverty line" of earnings not exceeding a guinea a week per family, number together 1,292,737, or 30.7 per cent. of the whole population. To these must be added, 99,830 inmates of workhouses, hospitals, prisons, industrial schools, etc., making altogether nearly 1,400,000 persons in this one city alone whose condition even the most optimistic social student can hardly deem satisfactory (*Labor and Life of the People*, edited by Charles Booth, 1891, vol. ii., pp. 20, 21).

Says the *Fabian Tract No. 5* (revised ed.): "In London one person in every five will die in the workhouse, hospital, or lunatic asylum. In 1892, out of 86,833 deaths, 48,061 being 20 years of age and upward, 12,713 were in workhouses, 7707 in hospitals, and 411 in lunatic asylums, or altogether 20,831 in public institutions (*Registrar-General's Report*, 1892, C-7, 238, pp. 2, 72, and 96). The percentage in 1887 was 20.7 of the total deaths; in 1888 it rose to 22.2, in 1891 to 24.2, and in 1892 it was 23.0.

It is worth notice that a large number of those compelled in their old age to resort to the workhouse have made ineffectual efforts at thrifty provision for their declining years. In 1890-91, out of 175,852 inmates of workhouses (one third being children, and another third women), no fewer than 14,868 have been members of benefit societies. In 4393 cases the society had broken up, usually from insolvency (*House of Commons Return*, 1891, Nos. 266 and 130-B). Considering that comparatively few of the inmates are children, it is probable that one in every three London adults will be driven into these refuges to die, and the proportion in the case of the 'manual labor class' must, of course, be still larger."

London, though the largest, is not alone in the evil condition of its working masses. In England the industrial friendly societies have in each large town their "proscribed streets." The Liverpool Victoria Legal Friendly Society proscribes, for Liverpool alone, on account of their insanitary character, 167 "streets wherein no members of the Society may be entered" (*Circular of October 13, 1886*). Yet these unhealthy streets are not too bad to be the only homes of thousands of the poorer citizens of that commercial center.

Says Mr. Frederick Harrison: "To me, at least, it would be enough to condemn modern society as hardly an advance on slavery or serfdom, if the permanent condition of industry were to be that which we behold, that 90 per cent. of the actual producers of wealth have no home that they can call their own beyond the end of the week; have no bit of soil, or so much as a room that belongs to them; have nothing of value of any kind except as much old furniture as will go in a cart; have the precarious chance of weekly wages which barely suffice to keep them in health; are housed for the most part in places that no man thinks fit for his horse; are separated by so narrow a margin from destitution, that a month of bad trade, sickness, or unexpected loss brings them face to face with hunger and pauperism. . . . This is the normal state of the average workman in town or country" (*Report of Industrial Remuneration Conference*, 1886, p. 429).

V. METHODS OF REFORM.

(a) Administrative.

Different classes of thinkers advocate very various methods of reform. The commission in New York State referred to above (see Sec. IV.) made the following recommendations:

"(a) A restriction of the power of the State legislature to interfere by special legislation with municipal governments or the conduct of municipal affairs.*

"(b) The holding of municipal elections at a different period of the year from State and national elections.

"(c) The vesting of the legislative powers of municipalities in two bodies: A board of aldermen, elected by the ordinary (manhood) suffrage, to be the common council of each city. A board of finance of from six to 15 members, elected by voters who had for two years paid an annual tax on property assessed at not less than \$500 (£100), or a rent (for premises occupied) of not less than \$250 (£50). This board of finance was to have a practically exclusive control of the taxation and expenditure of each city, and of the exercise of its borrowing powers, and was in some matters to act only by a two-thirds majority.

"(d) Limitations on the borrowing powers of the municipality, the concurrence of the mayor and two thirds of the State Legislature, as well as of two thirds of the Board of Finance, being required for any loan except in anticipation of current revenue.

"(e) An extension of the general control and appointing power of the mayor, the mayor being himself subject to removal for cause by the governor of the State."

The large movement for municipal reform in the United States, which has resulted in the formation of municipal reform leagues or civic clubs in all the large cities, and has now grown into a national municipal league, is not committed to one definite program, yet nevertheless does largely favor in all cities a similar program. It may be said in general to favor municipal reform, *first*, by rousing the attention of all classes of citizens, especially among the educated classes, to take an active interest in the conduct of civic affairs; *second*, by fixing municipal responsibility through the simplification of municipal systems; by such measures as increasing the power of the mayor, abolishing the bicameral system, doing away with so-called non-partisan boards and appointing single responsible commissioners in their place, substituting biennial or triennial elections for annual, reducing the number of departments, etc.; *third*, by divorcing municipal from national politics, introducing proportional representation, etc. But this movement is so important that we can only consider it an article by itself. (See MUNICIPAL REFORM ORGANIZATIONS.)

Somewhat opposed to this program, at least in asserting that it does not reach the bottom of municipal evils, is the view of those who believe that the one first and greatest way to reform city administration is to give it a large function. Says Professor R. T. Ely (*The Christian Union*, October 9, 1890):

"We are reversing the order of nature in planning to reform city government first and then to carry out changes and to make improvements in behalf of the poorer classes. Let any one name a city where this policy has been successfully pursued. I know of none.

"When the Hon. Joseph Chamberlain and his friends took hold of the corrupt and inefficient city government of Birmingham, they at once 'devised large measures,' including the purchase of gas and water works by the city. A public library followed; public parks, improved dwellings for the poor, large public undertakings, broad and generous measures, have been an essential part of municipal reform and improvement in cities like Berlin and Glasgow; they have not followed a purification of politics, but have helped to elevate political life.

"Has the experience of this country been different? Not at all. When the city government of Baltimore was worse than it is to-day, when the 'Plug Uglies' and 'Blood Tubs' were a terror, the government was improved by adding to its functions a paid police and a paid fire department. Extension of functions within a proper sphere improves government.

"When civil-service reformers in New York come before the people with large and generous plans of reform, with a program including adequate school accommodations, strict enforcement of the compulsory education law, better sanitary measures, public ownership and management of gas and electric light plants, playgrounds for children, public parks in crowded sections, and strict enforcement of laws for the protection of working children, and when leading citizens pledge themselves to these reforms, they will arouse an enthusiasm which will sweep the city. Austin, Texas, and several smaller places have recently been carried by large majorities for practical, tangible reforms. A part of the program in Austin was public water and electric lighting works, and the reform party ousted an opposition which had been elected by a large majority. It is estimated that one half of the voters changed their votes.

Professor Ely.

"Another fundamental fact is that the program which I propose will, when carried out, arouse municipal pride and self-respect. It will awaken what you may call a self-consciousness. Cities with us do not, as it were, respect themselves. They are like men who have lost their self-respect, while they are despised by private corporations, whose tool they become.

"Another fundamental fact, the last which may now be mentioned, is that you cannot separate local from national politics by merely talking about it. National politics are supreme in the minds of voters because they deal with real issues, like tariff reform, the silver question, pensions, federal election laws. When local politics come to mean what they should, when they involve easily understood issues of moment to all, then we will see less 'blind attachment to party and party candidates.'"

While private corporations carry on larger functions than the city, they will employ the best men. While the city officials are inferior men, and the corporations can gain from and are dependent upon city legislation, corruption must result. Such is the argument of those who believe that the one way to purify the city is to enlarge its functions. For the details of this argument, however, see MUNICIPALISM.

(b) Social Reforms.

For the details of these reforms see EDUCATION; MANUAL TRAINING; BATHS; LAVATORIES; TENEMENTS; PARKS; STREET RAILWAYS; TEMPERANCE; CHARITY ORGANIZATIONS; MUNICIPALISM, etc. The following program was laid by Professor R. T. Ely before the meeting of the Evangelical Alliance in Boston, December 4, 1889. He said:

"1. Let me first mention the means of education which should be liberally provided, and which should, for the most part, be gratuitously offered. I do not speak simply of schools of the lower grades, but of schools of all grades, and of much besides schools. I would thus broaden the way to success, and utilize all talent in the community. With these schools I would establish a sifting process, so that only the more gifted should advance to higher grades. Such a scheme has already been working in New York State for some time. There are State scholarships, entitling the recipients to free tuition in Cornell University, and one of them is offered for competition in each assembly district each year. There are thus over 500 all told. It may be that the ideal thing is a public educational system, comprising all grades of school up to and inclusive of the university. . . . But public education does not begin early enough for the needs of the city. The majority of children in cities are under bad home influences, and free kindergartens should be a part of the school system. It is all very well to talk about the work of the family, but what about the majority of children in large cities, for whom no wholesome family life exists? I have sometimes feared that my good friend, Dr. Dike, favored reactionary elements in not taking into account sufficiently the actual situation. Industrial training ought to be made important every-

where, and I note with satisfaction the progress it is making in Boston. Mr. Brace speaks of industrial schools as the best agency for reforming the worst class of children in cities, and the experience of the Elmira Reformatory in New York shows that a majority even of young convicted criminals can be reformed by it, when coupled with good discipline. We find that many criminals and paupers are uneducated and untrained in any trade. The apprenticeship system is antiquated, and city dwellings furnish no opportunity for girls to learn womanly occupations. Preparation for life must for all come from the school; for the many it is the only place whence it can come. . . .

"But our educational system should not cease to provide for people when they leave school. Education ought to end only with life. This brings me to mention such educational facilities as free libraries, free reading-rooms within convenient distance of every part of the city, perhaps in many cases attached to school houses, and open after school hours.

"University-extension lectures ought to be provided, and Mr. Dewey, of New York, has been working on some large plans for extension lectures to be connected with the public schools of New York State, and to be conducted under the auspices of the Board of Regents. Private undertakings, like Chautauqua, could well supplement whatever public authority does.

"Schoolhouses should be better utilized as gathering places for clubs, debating societies, and all bodies of men who would give guarantee of proper behavior. Open in the evening, they would help to counteract the baleful influences of the saloon.

"Art galleries and museums—which may multiply the value of pictures and other enjoyable articles a hundredfold, by rendering them accessible to all—may be mentioned under this general head, and, in my opinion, they ought all to be open on Sunday. I do not believe in leaving a free field to the devil every seventh day.

"It goes without the saying that religious education is an important part of all education, and that the Church should become more active than ever, and become to a greater extent than at present a real people's Church. Church buildings also are not as fully utilized as they might be.

"2. As a second item, and one closely connected, I mention playgrounds, parade grounds, play-rooms, and gymnasiums. I would include universal military drill for boys and young men. Experienced educators will tell you that a remarkable agency physical drill is for the cultivation of good morals; half of the wrong-doings of young rascals in cities is due to the fact that they have no innocent outlet for their animal spirits.

"3. The third item is free public baths and public wash-houses, like those which in Glasgow have proved so successful.

"4. The fourth item is public gardens and parks and good open-air music.

"5. Very important in all large cities is an improvement of artisans' dwellings, and the housing of the poor generally. All those who work among the poor speak about the great obstacle to reform and improvement found in rent. Mr. Barnett speaks of it as absorbing a large proportion of the earnings of artisans—namely, the fourth of a regular income—and Mr. Brace speaks of it repeatedly. A lady working in connection with the Charity Organization of Baltimore spoke of it thus a few days since in conversation: 'Rent! Oh, that is the dreadful thing! The rent of the poor just goes on increasing all the time; so do their appetites; but these have to wait, while the rent has to be paid!'

"I cannot speak of the many things which can be done and which are being done to improve the housing of the poorer urban classes. One of the most promising reforms, it seems to me, is to obey the law and assess all unimproved city land up to its full value, the very last dollar of its value, and then exempt all new dwellings from taxation for a period of five years. A somewhat similar plan appears to have produced excellent results in Vienna. Of course, this alone is not sufficient.

"6. My sixth item is complete municipalization of markets and slaughter-houses, rendering food inspection easier and more thorough.

"7. The seventh item is organized medical relief, rendering medical attendance and medicines accessible to the poor without a sacrifice of self-respect and independence. . . .

"8. Poor relief ought to be better organized, almshouses should be workhouses and workhouses should

Education.

Hygiene.

be industrial schools. . . . Any one may witness in Germany the beneficial effects of an extensive pension system. It is a great economy of resources, as smaller salaries are sufficient under a pension system; it diminishes poverty and pauperism, and thus relieves the public treasures. It prevents anxiety, and checks the greed begotten of uncertainty. An extension of the principle of insurance is desirable for similar reasons.

"9. The ninth item is improved sanitary legislation and administration. Great strides have already been made in this direction, but probably the urban death-rate among children of the poor under five years of age could still be reduced one half.

"10. The next item is a better regulation of the liquor traffic where its suppression is impossible. I think something better than high license is practicable. . . .

"But temperance reform ought to include positive measures, as well as negative, and how effective positive measures are, Mr. Brace's book amply demonstrates. The use of town halls and school-rooms for political and other gatherings in England has proved a good temperance measure. Do not simply drive out the saloon—replace it.

"11. Municipal savings banks. Such institutions have produced most gratifying results in many German cities. Deposits should be invested in city bonds and other good securities. The investment in city bonds would tend to give depositors a realizing sense of what they have at stake in municipal government.

"12. Ownership and management by the city of natural monopolies of a local character, like electric lights, gas works, street-car lines, docks, etc.

"I will not enumerate further items in this connection. I have already said that the individual force and energy of citizens should be used to inaugurate and

carry out these reforms. I would utilize in a higher degree than heretofore the help of women. Police matrons have done something for one class of our urban population in several American cities, and in Glasgow lady health inspectors have proved an efficient adjunct to the health department. Lady members of school boards have done good service in several cities.

Municipalization.

"We should also have private associations of women to insist on the enforcement of law. Something has been done in New York by the Ladies' Health Protective Association, which aims to secure enforcement of sanitary legislation and to insist on a proper street-cleaning service. We ought also to have in every city ladies' public educational associations, to stimulate the educational authorities and to see that the last letter of the law is obeyed; in New York, for instance, see that schoolhouses are provided for all children, and that the compulsory educational law is enforced.

"We should also have business men's associations, clergymen's associations, and the like, all to help to make the life of public servants who neglect their duty a burden to them.

"Whence shall come the resources for these reforms? I have already given the answer. A moderate and conservative municipalism will provide resources. It is simply necessary to utilize public resources. Comptroller Myers, of New York, recently said that he could pay all the expenses of the city government from dock rents, miscellaneous receipts, and the annual value of street car and other similar franchises. Berlin pays over 15 per cent. of its expenses from the profits of gas works; Richmond, Va., when I last looked at the report, about 7 per cent. We have also electric lighting as a source of revenue. Then we have plans which I have elsewhere described for securing a portion of the increment of city real estate for the public, and that without depriving any one of his property rights. Inheritances, and particularly collateral inheritances, may be taxed, and intestate collateral inheritances might be even abolished. Resources for every needed reform can be found in abundance whenever any honest search is made for them. We have yet no adequate idea of the public resources of a great city.

"Government is the God-given agency through which we must work. To many, I am aware, this is not a welcome word, but it is a true word. We may twist and turn as long as we please, but we are bound to come back to a recognition of this truth. Societies have failed. Society, particularly as organized in city councils or city governments, to adopt what is with us the more comprehensive designation, must recognize the work we want done as the concern of the community, and must themselves do it. The most success-

ful work, says Barnett, after his long striving, is done by the education act, the poor law and other socialistic legislation. That that is the most successful work is also illustrated by the life and career of the seventh Earl of Shaftesbury, who carried through Parliament legislation which has benefited millions of Englishmen. If simply by touching a person you could confer a distinct benefit on the person touched, it would take you 20 years to benefit as many people as have been benefited by legislation chiefly due to this great philanthropist. Also the experience of Elberfeld, Berlin, and other German towns, so celebrated for the administration of charity, confirms what is here said. Their success is due to private cooperation with official work. 'If nations had been ennobled by wars undertaken against an enemy, towns may be ennobled by work undertaken against the evils of poverty.'

"Societies have failed and will fail. They cannot, acting simply as societies, do the work. Their resources are inadequate, the territory they can cover is too small, and their power is insufficient. The Evangelical Alliance simply as such can never do the work. The Evangelical Alliance, like other societies, must put itself behind municipal government and recognize the reform and elevation of municipal government as one of the chief features of its work. It must strive to establish among us true cities of God. There is plenty of room for the individual and for individual activity. Not all the work can be done by government, altho without government very little can be accomplished. But, in addition to strictly private work, there is room for any amount of individual work in stimulating official work and in cooperation with official work.

"It takes a great effort and persistent, unflagging zeal to keep alive a few industrial schools like those which Mr. Brace has established in New York. He has my admiration for his great work, but I cannot help asking the question, If a little more energy had been used in stimulating public authorities and cooperating with them, would not greater things have been accomplished? Shameful, incredibly disgraceful as it may be to the authorities of New York City, 14,000 children in that city were this fall turned from the doors of the public schools because there was not room for them. Now, with 200 children to a school, it would take 70 private schools to educate these children, whereas the energy and zeal necessary to support to such schools expended in enlightening the public and stimulating the conscience of the municipal authorities would have rendered this criminal record an impossibility."

Says Rev. Mr. Barnett, after 17 years in East London: "The first practical work is to rouse the town councils to the sense of their powers, to make them feel that their duty is not to protect the pockets of the rich (by reducing taxes) and turning children away from public schools, as in New York, but to save the people." And "the care of the people is the care of the community and not of any philanthropic section."

CIVIC CHURCH, THE.—A movement originated and directed mainly by W. T. Stead (*q.v.*), the London journalist. It aims to secure the organization and cooperation of all philanthropic workers in every community. At pres-

ent it is little more than an unrealized ideal ; but its purpose and principles are so directly in the line of social reform, that we give it here as complete a description as possible. To give Mr. Stead's own words, and the reasons upon which he based his conception of a civic church, he writes : " The great want of the age is a church—a church which will not be a mere sect, but a real church, a working church, a church co-extensive with the community in which it exists ; a church which, like the old Church, has the power of excommunication, and exercises it ; a church which embraces the whole range of human life, and which influences all the affairs of life, alike in personal conduct and in affairs of municipal and national government. Until we can constitute a church which will somehow or other do the things which the old Church used to do, and which the modern Church largely shirks doing, we shall never get the key of the solution of the social problem." The fundamental idea, therefore, of the civic Church is that of intelligent and fraternal cooperation of all those who are in earnest about making men and things better than they are to-day. Speculative or religious differences would exclude no one from membership. It would not necessarily antagonize the existing Christian churches, but would bear the same relation to them that the main drain of a city bears to the wash-basins of private families. It would be distinctively Christian in that it accepts the example and teaching of Jesus Christ as authoritative, and adopts as its motto self-sacrifice for the welfare of others. Its demand is that every individual life must be helpful to the community, and that the community place no stumbling-blocks in the way of individual development. The ultimate object of the civic Church is the reconstitution of human society through the brotherly cooperation of all who are willing to take trouble to promote the welfare of others. The field of its operations is the whole range of the life of man, and especially so far as it touches the life of his brother man. Practically, it is the spiritual counterpart of the town council, and is to be established in every large center of population on the principle, " One town, one Church." It is composed of representatives and delegates from all the churches and all organizations that seek the good of the community. The civic Church would thus bring all moral and philanthropic institutions into sympathetic communication with one another ; it would energize separate organizations and unify all moral forces. Necessarily it would become an electoral center, a " moral caucus." It would keep moral questions to the front in all times of election, prevent the nomination of dishonest and immoral candidates, and endeavor to elect conscience as the spiritual mayor of the town. The duties of the civic Church may be considered as relating to the various stages of human life.

I. TO THE INFANT.

The civic Church would begin with the child before its birth. It would insist upon the infinite responsibility of parentage, and an improvement in ordinary ante-natal conditions. Lying-in hospitals would be established, and healthy

homes for foundlings. The civic Church would demand that every child be accorded the right to two legal parents. The nourishment of young children would be inquired into ; the crèche or something better would be established where necessary ; cruelty to children would be prevented, and child insurance investigated.

II. TO THE CHILD.

The civic Church would seek to secure to every child its natural play-time, and prevent early child labor. It would endeavor to provide parks or buildings in which city children might play. The education of children would not be overlooked ; kindergartens would be established and school walls brightened with pictures. Homeless children would be removed from work-houses and distributed where possible among the childless homes. Toys and picture-books would be collected from the wealthier families and placed in the homes of the alleys and slums.

III. TO THE YOUTH.

A system of scholarships is proposed which would enable the poorest student to graduate from the University. The civic Church would use all its influence to provide for young men and young women reading-rooms, evening classes, rooms and open places for recreation, bathing-houses, gymnasiums, etc. It would devise some means of instructing boys and girls ripening into maturity regarding the simple physiological truth about their own bodies. The housing of young people who have come alone to the large cities would be the object of much endeavor.

IV. TO THE ADULT.

As to the services which the civic Church might render to the adult citizen, Mr. Stead has prepared a catalogue of possible and helpful reforms which we here append.

THE ADULT AS A CITIZEN.

1. The education of the householder as to his civic and national responsibilities.
2. The stimulating of an intelligent interest in political and municipal issues.
3. The keeping moral issues to the front, as caucuses keep party issues.
4. The representation of the unrepresented, whether women, children, paupers, or subject races.
5. The cultivation of patriotism and the religion of citizenship.
6. The stemming the tide of national hatreds, and claiming justice even for the enemy.
7. The formation of volunteer corps.
8. The establishment of life and fire brigades.

THE ADULT AS A WORKER.

1. The development of self-reliance and mutual help by the formation of trade-unions.
2. The shortening of excessive hours of labor.
3. The enforcement of the laws for the protection of labor.
4. The encouragement of industrial arbitration.
5. The promotion of copartnership between employers and employed.
6. The appointment of women inspectors for women workers.
7. The prevention of sweating.
8. The payment of sailors' wages before leaving ship.

THE ADULT IN SICKNESS.

1. Provident dispensaries.
2. Hospitals—general, infectious, and convalescent.
3. Health lectures.
4. Sick nurses.

5. Medical comforts.
6. Change of air for convalescents.
7. Lying-in hospitals.
8. Blind asylums.
9. Deaf and dumb institutions.
10. Lunatic asylums.

THE ADULT IN THE WORKHOUSE.

1. Women on Boards of Guardians.
2. Brabazon scheme for employment of aged.
3. Decoration of walls of wards.
4. Library for inmates.
5. Supply of papers and magazines.
6. Constant supply of visitors.
7. Occasional excursions and treats.
8. Handkerchiefs and night-gowns for the bedridden.
9. Tobacco and snuff for the aged.
10. Lantern and other entertainments.
11. Music, instrumental and vocal.

THE ADULT AT LEISURE.

1. A minimum of public-houses, and those well conducted.
2. Saturday night and Sunday closing.
3. Clubs for men and women—temperance hotels.
4. Free library and reading-rooms.
5. Popular social evenings in board schools.
6. Good theatre and decent music-hall.
7. Bands in parks.
8. The preservation of open spaces.
9. Shade-trees and seats in streets.
10. Kiosks, lavatories, and drinking fountains in streets.
11. Lantern lectures.
12. University extension lectures.
13. Museums and art galleries.
14. Open churches and organ recitals.

THE ADULT IN BUSINESS.

1. Honest friendly societies.
2. Old age pensions.
3. Advisory council *re* investments.
4. Trade protection societies.
5. Cooperative societies.
6. The poor man's banker—Monts de Piété—popular banks.
7. The providing of adequate drinking fountains and lavatories in workshops and factories.
8. The establishment of the six days' working week.
9. Dining-halls with music.

THE ADULT OUT OF WORK.

1. Establishment of labor registries.
2. The creation of labor colonies.
3. The direction of emigration.
4. The improvement of casual wards.
5. The organization of charitable relief.
6. Temporary work for the unemployed.
7. The development of cottage industries.
8. Every man his allotment.

THE ADULT AT HOME.

1. Instead of slums, improved dwellings.
2. A good water supply.
3. Sanitary drainage.
4. Free baths and washhouses.
5. A garden for every home, if it is only a window-box.
6. Cheap transit by tram and rail.
7. Municipal lodging-houses.
8. Visitors for doss-houses.
9. Cooperative homes.

THE ADULT IN DEATH.

1. Homes for the dying.
2. Reformed funerals.
3. Cremation.

MISCELLANEOUS.

1. Enforcing the law against gambling.
2. Discouraging prostitution.
3. The poor man's lawyer.

Such is the ideal of the civic Church ; its realization would establish a kind of humanitarian

episcopate. But it is coming nearer than an ideal in many English towns, where the idea has been adopted and the principles put in practice. Every attempt as yet along the lines of the civic Church program has resulted in a marked strengthening and energizing of the forces of reform.

CIVIL SERVICE REFORM.—In the United States, civil service reform is understood to mean a reformation in the method of selecting public officials who hold appointive positions. At present the majority of public appointments are liable to be made upon the "spoils system" (*q. v.*), or by favor rather than from reason of special fitness of the appointee. Civil service reformers seek by various means to make fitness the first test of officials, and to make them more truly servants of the public by making them less dependent on the good will of an individual for their appointment to and tenure of official positions.

The system of appointment by favor—or "patronage," as it is well called—tho practised previously in New York and some other States, did not appear in America in national politics until during the administration of President Jackson, who used the power vested in him to arbitrarily dismiss the holders of appointive positions and distribute the offices among his own supporters. Previous to that time all offices except those with specified limit of tenure were practically held during good behavior, and so rarely were civil service officials removed that during the first 40 years the total was but 70. In 1820 an act was passed whereby the tenure of office by all who were charged with receipt and disbursement of public moneys was limited to four years—the object being to reduce the opportunity of fraud. It had, however, a further effect, which was viewed with much apprehension by Thomas Jefferson and other far-seeing statesmen. It placed a multitude of official positions at the disposal of the President, and with such opportunity it would be almost impossible to refrain from using the power for personal or party advantage. Their apprehensions were only too well founded ; for when President Jackson took office it was openly declared that the public offices were the spoils of the great Democratic victory, and the spoils belonged to the victors. When the offices had been filled by the partisans of one side, it was only to be expected that there would be retaliation, and a new set of partisan office-holders appointed when their opponents gained power.

Than this, nothing could be more demoralizing ; the politicians and the questions they discussed inevitably lost quality, the partisans in office having an eye to retaining their office, and their opponents looking forward to being able to supplant them, the motive being the "spoils" rather than principles. As a natural sequence, politics began to be regarded as a means of making a livelihood ; and "assessments" (see ASSESSMENTS) were levied on the office-holders, which they would be practically compelled to pay, as their quota of the expense of an election campaign which should maintain their party in office.

This system of "spoils," as it is called, which

permeates practically the whole of the United States politics, federal, State, and municipal, is the direct *raison d'être* of the "machine politics," with the "bosses," "rings," and all the chicanery and fraud which have gone to make the term "politician" a byword of scorn.

When the principle of appointment and tenure of office by "favor" became general, it soon became evident that the President would have to share the "patronage" with Congress. The result was that each Congressman of the President's party began to have chief control of the appointments in his State or district. This privilege soon came to be looked upon as a "right" pertaining to the position—a doctrine still largely held.

Under the "spoils system" the abuse of power became so flagrant that several proposals were made to remedy the evil, and in 1853 an act was passed prescribing examinations for certain official positions. This, however, soon degenerated into a farce. With the rapid increase of federal offices, due to opening up new territory after the war, the abuses became even more intolerable. In 1867 Mr. T. A. Jenckes, of Rhode Island, introduced into Congress a bill looking toward civil service reform, and by 1871 public sentiment was strong enough to bring about the passing of a law by which the President was authorized to make civil service rules and to require test examinations. The leader in the agitation was the Hon. George William Curtis (*q. v.*). President Grant established a system of competitive examinations, under the direction of a civil service commission, and made Mr. Curtis chairman. The results were beneficial in every way. Silas W. Burt, in the New York custom house, and T. L. James and Henry G. Pearson, in the New York Post Office, worked reform, but not to the liking of the supporters of "patronage" politics, and Congress soon refused appropriations for it; its work was consequently suspended, and it proved of little value except in paving the way for a more complete measure. About the same time competitive examinations were commenced by the Naval Officer at New York, and the custom house at that place gradually came to adopt the system with excellent effect; but this was a merely local attempt and not required by law. Notwithstanding Grant's message to Congress, urging the support of the commission, authorized in 1871, the messages of Hayes, Garfield, and Arthur calling for an efficient measure to reform the civil service, and executive orders forbidding political assessments (which orders soon became dead letters), nothing was accomplished till the latter part of 1882. Then a bill (often known as the Pendleton Bill) was introduced by a Democrat, Senator Pendleton, for reforming the civil service. It was approved by President Arthur, January 16, 1883. This bill prohibited all political assessments and the appointment of more than two members of the same family to public office. It created a civil service commission, consisting of three persons, not more than two from one political party, to be appointed by the President and confirmed by the Senate. The rules framed by the commission for carrying out the purposes of the act are subject to the approval of the President. The act applies to offices of more than 50 per-

sons in the departments at Washington, and in the customs and postal departments, with such exceptions as heads of departments, confidential clerks, etc.

This act was amended in 1884, so as to make it mandatory in all cities with a population of 20,000 and over. According to an article by Theodore Roosevelt, the prominent civil service reformer, and long one of the commissioners (in *Scribner's Monthly*, August, 1895):

"From the beginning of the present system each President of the United States has been its friend, but no President has been a radical civil service reformer. Presidents Arthur, Harrison, and Cleveland have all desired to see the service extended and to see the law well administered. No one of them has felt willing or able to do all that the reformers asked, or to pay much heed to their wishes, save as regards that portion of the service to which the law actually applied. Each has been a sincere party man, who has felt strongly on such questions as those of the tariff, of finance, and of our foreign policy, and each has been obliged to conform more or less closely to the wish of his party associates and fellow party leaders, and of course these party leaders and the party politicians generally wished the offices to be distributed as they had been ever since Andrew Jackson became President. In consequence the offices outside the protection of the law have still been treated under every administration as patronage, to be disposed of in the interests of the dominant party.

"The advance has been made purely on two lines, that is, by better enforcement of the law, and by inclusion under the law, or under some system similar in its operations, of a portion of the service previously administered in accordance with the spoils theory. Under President Arthur the first classification was made, which included 14,000 places. Under President Cleveland, during his first term, the limits of the classified service were extended by the inclusion of 7000 additional places. During President Harrison's term the limit was extended by the inclusion of about 8000 places; and hitherto, during President Cleveland's second term, by the inclusion of some 6000 places; in addition to which the natural growth of the service has been such that the total number of offices now classified is over 40,000.

"By the inclusion of the railway mail service, the smaller free delivery offices, the Indian school service, the internal revenue service, and other less important branches, the extent of the public service which is under the protection of the law has been more than doubled, and there are now nearly 50,000 employees of the Federal Government who have been withdrawn from the degrading influences that rule under the 'spoils system.' This of itself is a great success and a great advance, tho, of course, it ought only to spur us on to renewed effort. In the fall of 1894 the people of the State of New York, by popular vote, put into their constitution a provision providing for a merit system in the affairs of the State and its municipalities; and the following spring the great city of Chicago voted, by an overwhelming majority, in favor of applying in its municipal affairs the advanced and radical Civil Service Reform law which had already passed the Illinois Legislature."

In Massachusetts the system has become quite firmly established.

The success of the movement has been very largely due to the activity of the Civil Service Reform League. Such an association was formed in New York about 1876. It did not long endure, but in 1880 was revived under the presidency of Mr. Curtis. Other associations were formed in Brooklyn, Boston, Philadelphia, and elsewhere, and in August, 1881, these associations met at Newport and formed a National Civil Service Reform League, under the presidency of Mr. Curtis and then of the Hon. Carl Schurz.

In May, 1896, President Cleveland went still further, and included practically all the 85,200 Federal employees under the civil service law, thus completing the reform in the Federal service. This will mean that with the exception of a few heads of departments all public servants will have to prove their fitness by passing an open competitive examination as to their knowl-

edge of and ability to undertake the special work of the position they seek to fill. It is also proposed that the practical ability of the candidate be tested by making the appointment only a provisional one for a specified time, after which, if he prove satisfactory, the appointment to be permanent, subject to good behavior.

Competitive examinations are opposed by some civil service reformers on the ground that they may at times debar those really most fit for the positions by giving mere ability to "cram" for an examination an advantage over more solid merit and efficiency. The method of selection advocated by many who oppose the competitive examination is to leave it in the hands of the head of each department, but ensuring fitness by taking away the power of arbitrary dismissal, making the tenure of office for a fixed term, thus making the head of the department careful in his own interest to appoint those whom his experience would show to be most efficient.

Concerning the next important step in civil service reform in the United States, Mr. A. R. Kimball writes in *The Outlook* (May, 1894) that in a debate of the previous winter

"Senator Lodge, of Massachusetts, touched upon the weak spot of the present law—the spot which is attracting the attention and centering the discussion of all actively interested in civil service reform—when he said: 'The Senator from New Hampshire (Mr. Gallinger) made a point in regard to the injustice of arbitrary promotions, reductions, and removals. The point is very well made. There are arbitrary promotions, reductions, and removals, and the reason for these injustices to meritorious clerks arises from the fact that neither promotions nor reductions nor removals come within the scope of the law in any respect; they remain within the range of favoritism and patronage. That is the reason why they bristle with injustice at every point.' That it was the intention of the framers of the law to leave promotions, reductions, and removals at the mercy of partisanship was expressly stated by Senator Cockrell, who was in the Senate when the law was passed. He said: 'It was intended, and was so declared by Dorman B. Eaton and others, who wrote in regard to the proposed law, simply to guard the entrance into office, and had nothing to do with the back door, or exit. It protected no man in office. It was simply to relieve the departments and all from the pressure of appointments and changes in subordinate positions in the departments, and to make a test of fitness and qualification for those places before appointments were made.' . . .

"The 'injustices' to 'meritorious clerks,' with which the practical operation of the law 'bristles,' as Senator Lodge put it, owing to the fact that it governs appointments simply, and not promotions, reductions, and removals, are constantly illustrated. . . .

"The spoilsman who wants to substitute a man 'with a pull' for a good man holding a given place sends for a list of eligibles, with the announcement that a certain removal is to be made, 'for the good of the service,' of course. If the spoilsman's man is on the list of eligibles, why, the substitution is made at once. If not, the civil service people are informed that it has been decided 'not to make that change just at present.' Then the spoilsman waits until he thinks his man is on the eligible list all right. The process is repeated until the man 'with a pull' gets the job.

"The next step, then, in reform, obviously, is to limit the absolute power of removal as now exercised by heads of departments. This is what is aimed at in the proposed Letter-carriers' Tenure-of-office Bill, a bill approved by Theodore Roosevelt, who writes that the letter-carriers, 'I am glad to say, realize that the only trouble with the Civil Service Law is that it does not go far enough. The commission should have much more power than it has now, so as to prevent dismissals for partisan reasons, and to allow every public servant a chance to see any charges made against him and to be heard in his own defense before he is dismissed.' The *Buffalo Express* strongly states the argument for the bill: 'The *Express* has never

regarded the privilege of unlimited removal as anything but a concession to the spoilsmen, which may have been politic in the early days of the reform, but which the movement is now strong enough to abandon. Why should the entrance to the civil service be carefully guarded and the exit left wide open? It is absurd and unjust to require a man to undergo severe tests before he receives an appointment, and then to give him no guaranty of retaining it during good behavior.'

"But the argument is not wholly with the advocates of the change, even from the reform standpoint. The *Civil Service Chronicle*, of Indianapolis, whose standing as an able and zealous advocate of reform is not open to question, says, in discussing the Letter-carriers' Bill: 'The executive department should have the power of dismissal; this is essential to discipline and efficiency. The Civil Service Law is right in this respect. It is true that heads of offices take a mean and dishonest advantage of this power, as was done in Topeka, Terre Haute, Fort Wayne, and elsewhere. The remedy for that is public opinion and punishment by the President. Information, however, is an absolute necessity, and to this end the Civil Service Commission should have power to investigate every change in the public service within its charge, and to report the facts. Upon such facts public opinion and the President could act, and the time would speedily come when heads of offices would be ashamed to trick employees out of their places. It is unnecessary to repeat that every dismissed employee should be entitled at the time to an honest and fairly complete written statement of reasons, and that those reasons should be a part of the office records.'

"The question of the next step in civil service reform—a question which is likely to attract no small share of public attention in the immediate future—amounts simply to this: Is it better to impair, possibly, to some small extent, the efficiency of government departments by depriving executive officers of the absolute power of removal? or is it better to leave 'meritorious clerks' at the mercy of partisanship, when the removal of such clerks, and the consequent defiance of the spirit of reform, must also impair the *morale* and efficiency of the service? If one were sure of the interposition of that public opinion on which the *Civil Service Chronicle* counts, it would be easy to accept its view. But public opinion is slow to be aroused to the point of making itself felt. Meanwhile, the artificial checks which represent the best public opinion are its surest protection, even if at times they prove hampering and obstructive. For these reasons it seems probable that a majority of civil service reformers will come to agree with Mr. Roosevelt in his view of the wisdom of limiting the absolute power of removal."

The English civil service was, in earlier times, in a condition of political corruption which differed chiefly from the "spoils system" of the United States in the fact that the civil servants were more the tools of those in power and much less responsible as accomplices. It probably reached the worst point during the reign of James II., who, Macaulay says, "was determined to keep in public employment only such gentlemen as should be disposed to support his policy. . . . The commissioners of customs and excise were ordered to attend His Majesty at the treasury. Then he demanded from them to support his policy, and directed them to require a similar policy from all their subordinates."

In every town and village the court used its power, tampering with the elections of members of Parliament and all public officers, with the result that when the revolution of 1688 ousted James II. and called William of Orange to the English throne, "with rare exceptions all those in office and all those connected with the court or politics were seething sources of corruption."

Even with the new dynasty, tho some reforms were made, the "spoils system" still continued to dominate civil service, the only change being that instead of the king being the sole

source of appointments, they were largely bestowed as rewards for party zeal in the interests of the dominant political party of the time. In 1782 an administration was elected pledged to certain reforms in the civil service, but it was not till 1855 that any real reform was accomplished. An order in Council was then adopted, whereby for certain offices the candidates had to pass a competitive examination, and the position bestowed for merit quite irrespective of party politics. Despite the most strenuous opposition from the friends of the old system of patronage, the new reform, started chiefly as an experiment, was so successful that in 1870 the system of competitive examination and appointment for merit was made to apply throughout the whole of the English civil service.

C. Lodge, *Century*, October, 1890; by Theodore Roosevelt, *Atlantic*, February, 1895; and *Scribner's*, August, 1895. (See also CORRUPTION; MUNICIPAL REFORM; CURTIS; ROOSEVELT, etc.)

CLARK, JOHN B., was born in Providence, R. I., in 1847, and educated at the public high school, Brown University (two years), Amherst College (two years), Heidelberg University, and University of Zürich (about two and one half years). He received the degrees of A.M. and Ph.D. at Amherst. He traveled as student and tourist in France, England, Germany, Italy, and Switzerland, returning to America in 1875. He became Professor of Political Economy and History at Carleton College, Northfield, Minn.; Professor of History and Political Science at Smith College, 1881-92; Professor of Political Economy at Amherst College in 1892-1895, and is now Professor of Political Economy at Columbia College. He has been Lecturer on Economic Theory at Johns Hopkins University since 1892, and is (1895) President of the American Economic Association. His writings are: *Philosophy of Wealth; Capital and Its Earnings* (a monograph of the American Economic Association); *Modern Distributive Process* (written jointly with Professor F. H. Giddings, of Bryn Mawr and Columbia); *Wages* (a monograph of the American Economic Association, written jointly with Mr. Stuart Wood, of Philadelphia); articles in the *Yale Review*, the *Quarterly Journal of Economics*, the *Annals of the American Academy of Political and Social Science*, and *La Revue d'Économie Politique* (Paris), and other magazines.

CLARKE, WILLIAM, was born at Norwich, England. He graduated at Cambridge University (Historical Tripos), 1876; he gave political lectures throughout England, and gradually worked into journalism. He wrote articles in the *British Quarterly Review*, *Contemporary Review*, *North American Review*, *Political Science Quarterly*, *English Illustrated Magazine*, and *New England Magazine*. He wrote for the *Star* and *Echo* of London, and became connected with the London *Daily Chronicle* in 1890; he edited Mazzini's *Essays* and also *Political Orations* for the Camelot Series; wrote a critical work on *Walt Whit-*

man for Sonnenschein's Social Science Series; and the essay on *The Industrial Basis in Fabian Essays on Socialism*. A prominent member of the Fabian Society, he was a delegate to the Paris Labor Congress in 1889. He is widely known in the United States by his letters on social and political subjects, published mainly in *The Outlook*, and by his lectures delivered in Chicago, New York, Boston, and elsewhere, since published in the *New England Magazine*.

CLARKSON, THOMAS (1760-1846), was one of the most persistent and influential of English abolitionists. He commenced his life-work in 1825, while at Cambridge, by writing a prize essay against the principle of slavery. He secured the cooperation of Wilberforce (*q.v.*), who undertook the parliamentary campaign. Clarkson became one of the leading members in the anti-slavery society formed in 1823. His benevolence led him to take part in many other philanthropic endeavors, most notably in providing homes for sailors in the English seaport towns. Among his many anti-slavery publications are the following: *Essay on the Impolicy of the African Slave-trade; History of the Abolition of the African Slave-trade; The Cries of Africa to the Inhabitants of Europe; and also the Grievances of our Mercantile Seamen a National and Crying Evil*.

CLEARING HOUSES are institutions where the settlement of mutual claims, especially of banks, are effected by the payment of differences called *balances*. To the clearing house are sent all checks and drafts upon banks or other mercantile houses, and when all are in, each bank pays over or receives the difference between the checks or drafts it has brought in and the checks or drafts that have been brought in against it. It thus enables large quantities of accounts to be settled in an easy and expeditious way. The system originated in London between 1750 and 1770. In the United States it was not introduced till 1852, but since this date has had a very large development. In 1890 there were 60 clearing houses, with some 700 members. The Paris Chamber of Compensation was established in 1872. In England the system has been applied in a Produce Clearing House, and more recently in a Railway Clearing House. (See COMMERCE.)

CLIFFE, LESLIE. See LESLIE, THOMAS E. C.

CLIFFORD, JOHN, was born in Sawley, Derbyshire, in 1836, and at the age of 11 worked in a factory near Nottingham. At the age of 14 he was received into the Baptist Church, and soon became a student of the General Baptist College. In 1862 he took charge of the Praed Street Baptist Church, in London, of which church he is still pastor, altho the growth of the congregation has compelled the removal to the present chapel in Westbourne Park. In connection with his work Dr. Clifford pursued studies and took degrees and honors at London University. He has added an educational institute to his own church, where 1500 names stand enrolled in various classes. Dr. Clifford is known to-day for his active interest in social reform, his pulpit being open to Tom Man and

other socialists. He was one of the founders and is now president of the Christian Socialist League (*q.v.*). His address on *The Effect of Socialism on Personal Character* has been printed as a Christian socialist tract.

CLUBS. See WORKING MEN'S CLUBS; WORKING GIRLS' CLUBS; WOMEN'S CLUBS.

COAL INDUSTRY.—(See also MINES AND MINING.) It is not known when coal first came into use for household and industrial consumption. It seems to have been used in England at least as early as 825 A.D., and probably long before this. It forms to-day one of the most important, if not the most important, branch of mining. According to Mulhall, the production from 1801-89 has been as follows:

COUNTRIES.	Approximate No. of Tons.	Approximate Value.
Great Britain.....	5,406,000,000	\$10,640,000,000
United States.....	1,912,000,000	3,280,000,000
Germany.....	1,662,000,000	2,195,000,000
France.....	646,000,000	1,565,000,000
Belgium.....	621,000,000	1,250,000,000
Austria.....	438,000,000	460,000,000
Russia.....	59,000,000	95,000,000
Various.....	342,000,000	603,000,000
Total.....	11,086,000,000	\$20,090,000,000

The area of the world's coal fields, according to the same authority, is, in square miles:

China and Japan, 200,000; United States, 194,000; India, 35,000; Russia, 27,000; Great Britain, 9,000; Germany, 3,600; France, 1,800; Belgium, Spain, and other countries, 1,400. Total, 471,800.

The coal fields of China, Japan, Great Britain, Germany, Russia, and India contain apparently 303,000,000,000 tons, which is enough for 700 years, at present rate of consumption. If to the above be added the coal fields in the United States, Canada, and other countries, the supply will be found ample for 1000 years, and probably for a vastly longer period.

The present production of coal, according to the *Statesman's Year Book for 1895*, is:

	Tons.	Value.
United Kingdom (1893).....	164,325,795	\$279,049,940
United States (1892).....	160,088,295	207,637,139
Germany (1893).....	73,909,000
France (1892).....	26,178,701
Belgium (1893).....	19,411,000	36,281,250

According to the eleventh census, the product of the United States in 1889 was, in short tons of 2,000 lbs.:

STATES.	Tons.	STATES.	Tons.
Alabama.....	3,378,484	Nebraska and Dakotas.....	30,307
Arkansas.....	279,584	New Mexico.....	486,983
California and Oregon.....	186,179	Ohio.....	9,976,787
Colorado.....	2,360,536	Pennsylvania:	
Georgia & North Carolina.....	226,156	Anthracite.....	45,544,970
Illinois.....	12,104,272	Bituminous.....	36,174,089
Indiana.....	2,845,957	Tennessee.....	1,025,689
Indian Territory	732,832	Texas.....	128,216
Iowa.....	4,061,704	Utah.....	236,601
Kansas.....	2,230,763	Virginia:	
Kentucky.....	2,399,755	Anthracite.....	2,817
Maryland.....	2,939,715	Bituminous.....	865,786
Michigan.....	67,431	Washington.....	903,724
Missouri.....	2,567,823	West Virginia.....	6,231,880
Montana.....	363,301	Wyoming.....	1,388,947

Total product, 1889, short tons, 140,730,288, equivalent to 125,652,056 long tons of 2,240 lbs.

In Great Britain the principal coal fields lie (in the order named as to size) in South Wales, Yorkshire and Derbyshire, Northumberland and Durham, Scot, Lancashire, and Cheshire. In Europe, the principal coal fields lie in a line throughout the north of France and Belgium, in the easterly district of Silesia and Russia, and in basins in Southern and Central France, Saxony, and Bohemia. The collieries of Northumberland and Durham hold the first place among the English mines, and their colliers belong to the aristocracy of labor. Before organization among them, however, their condition was pitiable in the extreme, as can be seen in the evidence collected in the Royal Commission's report on the *Condition of the Children Employed in Mines* in 1842. As a result, the early efforts at improving their condition were attended with bitter and tumultuous contests, and strikes were frequent. A national miners' association sprang up in 1843, and at its conference, in Glasgow, in 1844, 70,000 men were represented. Nevertheless, after a disastrous strike in that year it broke down, and there was no effective organization till a national union was established in 1863, mainly owing to the efforts of Alexander Macdonald (*q.v.*), who was for 15 years the miners' trusted leader. Under his lead the miners agitated for an eight-hour bill for boys, but not for men. The principle of the Durham and Northumberland miners, who controlled the union at this time, as distinguished from those of other counties, has always been to attempt to gain higher wages and shorter hours through trade-union effort rather than through legislation. Macdonald's own aim, however, was to establish a standard of life, and he looked for aid in legislation to establish this. From 1864-69 strikes were constant. In 1872 representatives of the Durham miners and of the coal-owners met and established a *Standing Joint Committee* (see ARBITRATION AND CONCILIATION), and the same step was soon taken in Northumberland. In 1876 a sliding scale (*q.v.*) was agreed upon. These methods of adjusting difficulties, however, have by no means prevented all strikes. Strikes in the coal trade have taken place, notably in 1879, in 1886-87, in 1890, and the largest strike of all in 1893, when all England was affected, and a settlement was only reached by the Government's proposal of conciliation. The English miners' movement has thus become divided. The Durham and Northumberland miners advocate efforts at raising wages and reducing hours by trade-union organization and agreement with the coal-owners and adoption of the sliding scale; the other miners' unions favor the limiting of production and an eight-hour day, and more recently a living wage to be gained by legislation. Gradually the old miners' Union has shrunk up to Northumberland and Durham, and in 1888 a new miners' Federation was formed at Manchester to advocate the opposing policy. The national conferences, which have been long held by the miners down to 1889, were called by the Union; since then they have been called by the Federation. This Federation has grown from 36,000 members in 1888 to 200,000 in 1893, making it the

Great Britain.

leading trade-union in England. Wages in the English coal mines vary. The hours are short. In Durham, Schulze Gaevernitz (*Social Peace*, p. 182) puts the wages, on the authority of the secretary of the coal owners, at 4s. 8d. a day for a seven-hour shift.

In France, and especially in Belgium, the wages of coal miners are much lower, and have led to repeated strikes. In the last-named country alone, of the countries of Western Europe, women have until very recently worked underground. (For the wages, see BELGIUM AND SOCIAL REFORM.) In Germany, wages for underground miners varied in 1890 from 65 cents per day in Silesia to \$1

Europe. The miners in Silesia seem wholly unorganized.

Women are only employed above ground, and in the State mines not at all. Important strikes in the western mines took place in 1889 and 1892.

The chief mining districts of the United States are the anthracite coal district of Eastern Pennsylvania, the bituminous coal district, which includes Western Pennsylvania, Ohio, Illinois, and Indiana, and the coal and iron mines of Colorado. A few mines are also to be found in the Southern States and in California.

In the United States coal mining has led to some of the most bitter industrial conflicts.

John McBride, a leader of the miners, writes in George E. McNeill's *The Labor Movement in America* (1887, p. 241):

"Scattered in remote districts—frequently many miles away from the towns—and shut off almost entirely from social intercourse, the opportunities for the interchange of ideas and the upbuilding of compact, serviceable organizations have necessarily been slight. Nor is this all. The coal miner has been of necessity a bird of passage. Different seasons have found him in different localities, as the opportunities for work have offered. . . . There have been other difficulties. . . .

One of the most serious of these has been the employment of farm-hands in the mines during the winter season. This practice has introduced an element which had nothing to gain by such organizations as the skilled miners were striving to build up. . . . To them it was of little consequence whether the wages were high or low. Employment in the mines was not their chief dependence." Mr. McBride tells us that the earliest efforts at organization were in 1857. In January, 1861, a national American Miners' Association was formed, with Daniel Weaver for president. It was largely confined to the Belleville Tract, Illinois. Soon after a tailor, John Hinchliffe, started a paper, the *Weekly Miner*. He was later elected president of the association, and in 1871 elected by the miners to the legislature, and in 1873 chosen State Senator.

Other associations sprang up, but all disappeared in the strikes of 1867 and 1868. In 1871 an organization was effected at Bloomington, Ill. Associations sprang up also elsewhere, notably the Miners' and Laborers' Benevolent and Protective Association in Pennsylvania. This became strong, and endured through several strikes. In 1873 a National Association of Miners was organized at Youngstown, O. Unions multiplied in Pennsylvania, Maryland, Ohio, Indiana, Michigan, West Virginia, and Kentucky. In 1875 the association was in the zenith of its favor, but strikes sprang up and were nearly all failures. The same year the order of the Knights of Labor began to spread among the miners, and grew rapidly. In 1882 the Ohio Miners' Amalgamated Association was formed, and in September 12, 1885, the present National Federation of Miners and Mine Laborers in the United States. (See MINERS' UNIONS.) Daniel McLaughlin was the first president. Strikes, meanwhile, were common. In 1874 and 1875 the companies imported many Italians, colored men, and, later, Hun-

garians, and these became the source of many strikes. Professor Bemis says (*The Outlook*, May 12, 1894): "In October, 1885, after a series of fearful strikes in Southern Ohio, which has made the Hocking Valley forever famous, Colonel W. P. Rend, of Chicago, a well-known operator, and officers of the miners' unions met at Chicago to arrange a compromise. In the forenoon only three operators attended, but after dinner more were induced, by the urgent solicitations of Mr. Rend, to come in, and the conference adjourned to meet at Pittsburgh in December. A larger attendance was there secured, and another adjournment was had to Columbus, O., where, in February, 1886, an agreement was reached by a majority of the soft-coal operators of Pennsylvania, Ohio, Indiana, Illinois, and West Virginia to fix a scale of wages for the year according to an agreed-upon basis. The rates differed roughly with the difficulties of mining.

Strikes.

"But while the operators in Ohio have always lived up to the agreement, and were able to advance wages from 60 to 70 cents a ton and live in peace with their men, the inability of the unions to organize and bring into line the unions of Southern Illinois gave a pretext to the Northern Illinois operators to withdraw and cut wages in 1889, as is vividly, bitterly described by Mr. Henry D. Lloyd in his *Strike of the Millionaires against Miners*. Indiana followed Northern Illinois, but Ohio and Western Pennsylvania continued faithful most of the time, and met in yearly conference over wages and other conditions of employment.

"The miners of Western Pennsylvania had agreed through their organizations to receive from their employers 70 cents a ton for coal for the year ending May 1, 1894. Ohio miners, because of slightly better conditions for mining, had contracted with their employers to receive 70 cents in most of the mines. The depression in general business last fall caused the shutting down of the ironworks about Pittsburgh, and the trouble began. The fault seems to have been wholly the employers', if my informant in this matter, himself a prominent coal operator and employer of over 2500 miners in that and other fields, is reliable authority. Many of the Pennsylvania operators deliberately broke their contract with the miners' organization by cutting wages from 70 cents to 60 cents, in the hope that by so doing they could secure a monopoly of the coal market. Unfortunately, the miners' organization in these mines was too weak to protest. Thereupon Mr. John McBride, then President of the Miners' Union, called together, apparently without solicitation, the operators in Western Pennsylvania, who had held to their agreement. Stating that the miners felt that the more unscrupulous employers should not be allowed to wrong those operators who kept their agreement, he relieved the latter of their contract to pay 70 cents. Thereupon the employers who had first cut wages made another reduction to 55 cents. Cut followed cut, until the wages are from 45 cents to 50 cents in Western Pennsylvania. The operators in the Hocking Valley were forced to reduce their wages from 70 cents to 50 cents on February 17, but maintained all the time the friendly relations with the miners' unions. A few conspicuous operators of Ohio even championed the cause of the men as one to be indorsed by the operators, if only the unscrupulous operators could be brought to terms. It has been found, operators tell me, that reduction in wages has reduced their profits more than proportionately, since now they can sell their screen lump coal at but 70 cents at the mine, and their family coal at \$1.05 to \$1.10, while the small coal, which is not estimated in determining the wages of miners, but which formerly sold at 50 cents and more, can no longer be marketed because of the fall in price of better grades. As the reduction in price increased, the output and business interests of the country were not benefited to any appreciative degree, for coal at the mines now sells for about one half of the price in England, as Schoenhoff and the United States Bureau of Labor Statistics have shown, and only a ton to a ton and a half is used in making a ton of iron, so that the change of 30 cents a ton in wages means a change of only from 30 cents to 40 cents in iron.

"According to the United States Bureau of Labor Statistics, the 6.75 short tons of coal used in making a ton of steel rails cost, in labor of mining, \$5.27. A fall of even one third in wages would thus reduce the cost of steel rails only \$1.76; and rails in 1890, when this computation was made, were selling at \$24.67.

"From the report of this same bureau on textile factories it appears that the fuel-cost averages about 2 per cent., rarely exceeding 3 per cent., of the total costs. Evidently the reduction of wages in coal-mining can-

not have materially stimulated industry or greatly benefited the home consumer.

"Under these circumstances the miners find that cut-throat competition in the midst of weak labor organizations and a low standard of living brings them as nearly to the iron law as has been witnessed in any recent experience in the sweat industries. No wonder they are resorting to the one weapon left—a systematic quitting of work. Fortunately, the miners of Southern Illinois, who, as has been stated, never were in unions, and thus gave an excuse, at least, for the breaking away from the Columbus scale of Northern Illinois and then of Indiana, have begun to join the ranks of the strikers."

Since Professor Bemis's writing, the strike of which he speaks has ended. Only a few trifling concessions have been gained. (For a vivid sketch of a coal strike, see H. D. Lloyd's *A Strike of Millionaires against Miners*). In 1837 and 1888 important strikes occurred in the Lehigh and Schuylkill districts against the Reading Railroad, both being finally lost.

Yet the agitation of these strikes has produced some fruit, partly in better legislation, partly in the willingness of some of the operators to treat with the organizations of their men. In few trades, however, are there more differences between operating companies, and too often the unscrupulous are able to secure the control.

According to the Illinois report for 1890, there has been a gradual decline both in the value of coal and in the rate of wages; the former has fallen from \$1.51 a ton in 1882 to \$1.02 in 1890, and the latter from 80.2 cents a ton in 1883 to 68.3 cents in 1890. This is now the price for hand mining, and about 80 per cent. of the coal is still mined by hand. Machine mining was not generally introduced until 1888, and is not as well paid as hand mining. Wages for machine cutters are from \$2 to \$2.50 for a day of 10 hours; drillers, blasters, and timbermen get \$2, and laborers, \$1.75. Hand miners average \$2.23 a day, while very few machine cutters get over \$2, owing to the smaller amount of skill required in their work. The truck system of paying wages prevails to some extent, and deductions are made for pow-

der, lights, and tool-sharpening. The falling of coal or slate from the roof of the mine is the most common cause of accidents.

The fact that the wages of miners are kept low is due in part to the large supply of foreign labor, available at the shortest notice, to fill the places of men on strike. A number of Poles, Hungarians, and Italians are employed in the Pennsylvania mines; they are housed in sheds belonging to the mine owners, and can live at a very small cost. According to a journalist who was examined before the Select Committee on the Importation of Contract Labor in 1889 on the results of a special inquiry conducted by him into the condition of the miners, the effect of the rapid introduction of foreign labor into the mines had been to reduce wages 50 per cent., the foreign laborers receiving sometimes no more than from 40 to 50 cents a day.

The introduction of foreign labor has been most widely used in the mines owned by the railroad companies. Since those companies began to engage in mining enterprises they have practically destroyed competition. According to an agreement made among themselves in 1876, it was stated "that each transporting company shall be held responsible for the faithful adherence to these regulations on the part of all individual shippers using its lines to carry coal to competitive points." The companies, which included the Philadelphia and Reading, the Jersey Central, the Delaware, Lackawanna and Western, and the New York, Lake Erie and Western, sometimes buy up the output of individual mines, or compel their owners to submit to terms by refusing the cars required for transport or raising the freight rates. In the same way cars are withheld from the workmen when the companies wish to restrict the output of coal for the sake of maintaining prices.

The following table, compiled from Census Bulletin No. 74, gives the wages of employees in the coal mines of Ohio, Illinois, and Indiana for 1889:

ABOVE GROUND.													
	FOREMEN OR OVERSEERS.			MECHANICS.			LABORERS.			BOYS UNDER 16 YEARS.			Total number employed.

In the bituminous coal mines of Pennsylvania, according to Census Bulletin No. 67, 53,780 employees received an average of \$393 per year. But this is only a general average. Professor Bemis (*The Outlook*, May 12, 1894) writes:

"Of 500 workers in the bituminous coal mines, rated as typical in Ohio, Indiana, Pennsylvania, West Virginia, and Alabama in 1890 by the United States Bureau of Labor Statistics, 86, or 17 per cent., earned under \$300, and 166 others, or 33 per cent., earned from \$300 to \$400 per year. Over half of the 500 earned under \$400, and 79 per cent. earned under \$500. . . .

"According to computations of the writer, based on the census of 1890, as given in the bulletins, the average wages of the 24,323 miners in Illinois were only \$6.87 a week; of the 19,591 Ohio miners, \$6.76; of the 53,780 bituminous miners of Pennsylvania, \$7.55; and of the 70,660 anthracite men, \$6.21. The report for 1892 of the Ohio Bureau of Labor Statistics confirms this, for it gives the average weekly earnings in 1892 in that State as \$6.67. In most States wages average about \$2 a day when the men have work, but this is usually not over 200 days in the year. The influence of high charges in the company stores in further diminishing these meager wages need not be described. The Illinois Supreme Court, two years ago, blind to the opposite decisions of Eastern and English courts and the dictates of common sense, refused to sustain a law against them, because an interference with the 'freedom of contract' guaranteed in the Constitution."

This review of the strikes and wages conditions existing in the coal mines brings out the relations of the great railroad corporations to coal mining. On this point we quote from the address delivered by Mr. Henry D. Lloyd, of Chicago, before the Interstate Anti-trust Conference at Chicago, June 6, 1893. He says:

"Within the last 30 years 95 per cent. of the anthracite coal of America, practically the entire supply, it is reported to Congress this year, has passed from the ownership of private citizens, many thousands in number, into the possession of the railroads controlling the highways of the coal fields. These railroads have been undergoing a similar

Monopolies. process of consolidation, and are now the property of eight great corporations. This surrender of their property by the individual coal mine owners is a continuing process in operation at this moment, for the complete extinction of the 'individual' and the independents in this field. It is destined, according to the report of Congress, to end in the entire absorption of the entire anthracite coal fields and collieries by the common carriers.

"Anthracite coal is geographically a natural monopoly contained in three contiguous fields, which, if laid close together, would not cover more than 8 miles by 60. But bituminous coal, altho scattered in exhaustless measures all over the continent, is being similarly appropriated by the railroads, and its area is being similarly limited artificially by their interference.

"Railroad syndicates," says the Congressional investigation of 1888, are buying all the best bituminous coal lands along their lines in Missouri, Kansas, Colorado, Arkansas, Tennessee, Alabama, and other Western States and Territories, no doubt with a view of levying tribute upon the people's fuel and the industrial fires of the country."

"The process of consolidation is shown by official and judicial investigation to have been in progress in the bituminous fields at least as far back as 1870, with the same purposes, methods, and results as in the anthracite fields, tho more slowly, on account of the greater number and vastness of the deposits.

"The bituminous fields from Pennsylvania to the Pacific coast are narrowed to the territory along the railroads, and narrowed there again to the mines owned or favored by the railroad managers. . . .

"The coal is an article of commerce greater in volume than any other natural product in the United States carried on railroads, amounting to not less than 130,000,000 tons a year, and tho the appliances for its transportation have been improved and the cost cheapened every year, so that it can be handled with less cost and risk than almost any other class of freight, the startling fact appears in the litigations before the Interstate Commerce Commission and the investiga-

tions by Congress that freight rates have been advanced instead of being decreased, are higher now than they were in 1870, and that coal is made by these confederated railroads to pay rates vastly higher than the average of all other high and low class freight, nearly double the weight on wheat or cotton. These high freight rates serve the double purpose of seeming to justify the high price of coal and of killing off year by year the independent coal producers. What the railroad coal miner pays for freight returns to its other self, the railroad. What the independent coal producer pays goes also to the railroad, his competitor. 'This excess over just and reasonable rates of transportation,' says the report to Congress in 1893, 'constitutes an available fund by which they (the railroads) are enabled to crush out the competition of independent coal producers.'

"By these means, as Congress found in 1888, the railroad managers have forced the independent miners to sell to them or their friends at the price they chose to pay. They were the only possible buyers, because only they were sure of a supply of cars and of freight rates at which they could live.

"The private operators thus being frozen out are able, as the investigation by the New York Legislature in 1878 showed, to produce coal more economically than the great companies, because not burdened with extravagant salaries, royalties and leases, interest on fictitious bonded debts, and dividends on false capitalization of watered stock. By the laws of supply and demand they would compete out the unwieldy corporation, but these administer a superior political economy in their supply and demand of cars and freight rates.

"The railroad companies engaged in mining and transporting coal are practically in a combination to control the output and fix the price. They have a practical monopoly of the production, the transportation and the sale of anthracite coal.' This is from the House of Representatives' report of 1893, and such has been the finding in all the investigations for 20 years.

"The anthracite collieries of Pennsylvania could now produce 50,000,000 tons a year. The railroads restrict them to 40,000,000 or 41,000,000, nine or ten million tons less than they could furnish to ward off the frosts of winter, and to speed the wheels of the world, and this creation of artificial winter has been in progress from the beginning of the combination.

"In the 10 months between February and November, 1893, the price of coal in the East, as investigated by Congress, was advanced by the coal railroads as much as \$1.25 and \$1.35 a ton on the kinds used by housekeepers. 'The combinations,' the report of Congress says, 'exercise even a more baleful influence on the production and transportation of coal for the Western market.' The extortion in the price fixed by the railroads was found by Congress in 1888 to be an average of \$1 a ton, considerably more than \$1 a ton on all consumed in the United States, or \$39,000,000 in that year, and now \$40,000,000 to \$47,000,000 a year. The same investigation found that between 1873 and 1886, \$200,000,000 more than a fair market price was taken from the public by this combination.

"This is anthracite alone. How many hundreds, perhaps thousands of millions more have been taken by the railroads which control the bituminous coal fields from Pennsylvania to the Pacific there are no adjudicated means of estimating. . . .

"Congress found in 1888 that the coal companies in the anthracite regions keep thousands of surplus laborers on hand to underbid each other for employment and for submission to all exactions; hold them purposely ignorant when the mines are to be worked and when closed, so that they cannot seek employment elsewhere; bind them as tenants by compulsion in the companies' houses, so that rent shall run against them, whether wages run on or not, and under leases by which they can be turned out with their wives and children on the mountain-side in midwinter if they strike; compel them to fill cars of larger capacity than agreed upon; make them buy their powder and other working outfit of the companies at an enormous advance on the cost; compel them to buy coal of the company at the company's price, and in many cases to buy a fixed quantity—more than they need; compel them to employ the doctor named by the company, and to pay him whether sick or well; 'pluck' them at the company's stores, so that when pay day comes around the company owes the men nothing, there being authentic cases where 'sober, hard-working miners toiled for years or even a lifetime without having been able to draw a single dollar, or but a few dollars in actual cash; in debt until the day they died;' refuse to fix the wages in advance, but pay

them upon some hocus-pocus sliding scale, varying with the selling price in New York, which the railroad slides to suit itself, and, most extraordinary of all, refuse to let the miners know the prices on which their living slides; a fraud, says the report of Congress, 'on its face.'

"The companies dock the miners' output arbitrarily for slate and other impurities, and so can take from their men from 5 to 50 tons more in every hundred than they can pay for.

"In order to keep the miners disciplined and the coal market undersupplied, the railroads restrict work, so that the miners often have to live for a month on what they can earn in six or eight days, and these restrictions are enforced upon their miners by holding cars from them to fill, as upon competitors by withholding cars to go to market. Labor organizations are forbidden, and the men intentionally provoked to strike to affect the market.

"The laboring population of the coal regions, finally, is kept down by special policemen enrolled under special laws, and often in violation of law, by the railroads and coal and iron companies practically when and in what numbers they choose, and practically without responsibility to any one but their employers, armed as the corporations see fit with army revolvers, or Winchester rifles, or both, made detectives by statute, and not required to wear their shields, provoking the people to riot and then shooting them legally. 'By the percentage of wages,' says the report of Congress, 'by false measurements, by rents, stores, and other methods the workman is virtually a chattel of the operator.'

"The investigation of 1888 showed that the carrier drives out both operator and owner, obtains the property, works the mine, disciplines the miner, lowers wages by the importation of Huns and Italians, restricts the output, and advances the price of coal to the public. It is enabled to commit such wrongs upon individuals and the public by virtue of exercising absolute control of a public highway.

"Moved mainly by the disappearance of a free market in oil and coal, the people of Pennsylvania arose in 1873 and adopted a new constitution. To put an end to the consolidation of all the anthracite coal lands into the hands of the railroads, this constitution forbade common carriers to mine or manufacture articles for transportation over their lines, or to buy land except for carrying purposes. These provisions of the constitution have been disobeyed 'defiantly.' 'The railroads have defiantly gone on acquiring title to hundreds of thousands of acres of coal, as well as of neighboring agricultural lands,' says the Congressional committee of 1888. 'They have been aggressively pursuing the joint business of carrying and mining coal.' So far from quitting it, 'they have increased their mining operations by extracting bituminous as well as anthracite.'

"Instead of enacting 'appropriate legislation,' as commanded by the new constitution to effectuate its prohibitions, the Legislature has passed laws to nullify the constitution by preventing forever any escheat to the State of the immense area of lands unlawfully held by the railroads. Every effort breaking down to meet the evil by State action, failure was finally confessed by the passage, in 1878, by the Pennsylvania Legislature, of a joint resolution asking Congress to legislate 'for equity in the rates of freight,' and to this day the will of the people of Pennsylvania, as declared in their sovereign utterance, has found among these corporations none so poor as to do it reverence.

"In 1887 Congress passed the interstate commerce law and established the interstate commerce commission to enforce justice on the railroad highways, in the language of the committee reporting it, 'without expense to the shipper, without delay and without resort to litigation.' The failure of the commission has been calamitous. The independent mine owners of Pennsylvania appealed to it for the justice promised 'without expense, without delay and without litigation.' Two years and a half were consumed in the proceedings. The commission decided that the rates the railroads charged were unreasonable and unjust, and ordered them reduced. But the decision has remained unenforced and cannot be enforced. The railroads treat the commission with the same contumely they visit on the constitution of Pennsylvania, and two years after its decision Congress in 1893 found their rates to be 50 cents a ton higher than what the commission had declared to be just and equitable. The independent oil refiner of Pennsylvania and Ohio has fared still more disastrously, before the commission. In one proceeding, for more than four years they have

been appealing for rescues from rates which are pressing them to death, but in vain. The delay is 'killing,' they recently pleaded, but the delay continues. The interstate commerce law provides for the imprisonment in the penitentiary of those guilty of the crimes it covers. But the only conviction had under it has been of a shipper for discriminating against a railroad. No railroad man has been brought to punishment for the countless crimes committed by railroads against shippers.

"Congress has passed an anti-trust law; many of the States have passed anti-trust laws; there have been appeals to the courts for redress under conspiracy laws and for forfeiture of charters. Nothing has come of all this legislation and litigation. The sugar trust, the oil trust, have been forced to hang out new signs; in New Jersey one of the leases binding two of the coal combinations together has been broken, but the sugar and the oil and the coal monopolies do not wane but wax.

"To remove the tariff on coal would have brought the product of Nova Scotia into competition with our American rings 12 months ago. But within the year the mines of Nova Scotia have been syndicated by American capitalists, and it will be they who will win when the tariff is taken off coal. Monopoly moves across tariff; there are already several international trade combinations, and there will be more before there are fewer.

"A real interstate commerce law with a uniform classification of freight for the whole country, under a few simple heads, with rates inflexibly the same for all shippers, wholesale or retail, under each head on the post-office principle, and with rates fixed by the Legislature and cut down to figures which would pay the legal rate of interest on the present actual cost of reduplicating the right of way and equipment, would 20 years ago have prevented the confiscation of the property of the many who had to use the highways into the treasuries of the few who owned the highways. But not to-day. The members of the coal combination are Siamese twins. Chang runs the railroad, Eng runs the coal mines. Chang has been charging high freights to ruin the independents, and Eng, also to ruin the independents, has been selling coal for less than cost, counting this freight extortion as part of the cost. The net has caught the fish. The independents are ruined—95 per cent. of them. Make Chang put down freights as low as you please, Eng will put up the price of coal. Coal is his private property, and he has a right to do with it what he will.

"The syndication of bituminous coal lands has also gone so far that the owners by combination and competitive market wars could suppress all rivals and fix the supply and the price independent of any help from highway privilege. They have grown great enough by that help to do without it, and to prevail for the future by the mere mass of their millions.

"Even if the insignificant minority still living in the coal, oil, and other centralized industries continue to survive no relief for the public can be expected from them. They might be saved by railroad reform, but they would take advantage of the prices set by the ruling power. It is a well-known law of trade that where an overshadowing power over prices and conditions has been gained by any element, the minority take the benefit of the standard it upholds. 'The public, however, must bear in mind,' says the report of Congress of 1893, 'that where so preponderating a quantity of any given article is controlled by one organization, it will be natural that the holders of the smaller portion should fall into line with the price fixed by the larger. This has been the case within the last season.'

COBDEN, RICHARD, born near Midhurst, in Sussex, June 3, 1804; died in London, April 2, 1865. His father was a farmer, but at an early age he entered a London warehouse, and after a time became traveler for the firm. In 1832 he started a cotton-printing business of his own at Manchester and Salden.

There are three great political agitations with which his name will be always connected—the repeal of protective duties, the movement against war and military expenditure, and the one in favor of commercial treaties.

The general spirit of his whole policy is well expressed in the motto quoted by himself (in

England, Ireland, and America) from George Washington: "The great rule of conduct in regard to foreign nations is, in extending our commercial relations, to have, with them, as little political connection as possible."

He believed that a nation's first care was for its own household, and that political and military entanglements interfered with the performance of a nation's duty in this respect. He preached the policy of non-intervention, opposing with Bright the war with Russia and China. He maintained that the prosperity of the nation demanded, not military glory and conquest, but a larger population and a wider trade. Cobden and the "Manchester school" of politicians erred in mistaking the welfare of merchants and manufacturers for the welfare of the whole nation; their standpoint was that of the employer of labor, not that of the people. They were the advocates of direct taxation. Cobden has been denounced as a mere pleader for a "let alone" policy in matters of trade; but it must be remembered that in his day British trade was hampered by absurd governmental restrictions from which it is free to-day. A policy which was best then may be unwise at the present time. Cobden did much for the cause of free education. It was largely owing to his efforts that the Manchester Athenæum was established.

We need not here enter into the details of his busy political career, and shall only mention one more conspicuous service which he rendered, not only to his own country, but to the United States as well. Devoted as he was to the arts of peace, the outbreak of the American Civil War was to him an event most deeply to be deplored. From first to last his sympathies were with the North, because the South was contending for slavery. He was extremely anxious that Great Britain should adopt a just and worthy attitude toward the struggle; and when, therefore, vessels which sailed from English ports committed depredations upon American commerce, he sternly and forcibly brought the question before the House of Commons. Altho attacked for a time on every side because of his manly stand for honor and fair play, he persisted in a series of speeches to maintain his position. His death was the occasion of many tributes of honor and esteem, all classes uniting in confessing him to be a statesman who was unswerving in his fidelity to conscience and to what he believed to be the best interests of his country.

CODE NAPOLEON.—Few codifications of law have played the part or had the influence of the Code Napoleon. There were two kinds of law in France before the Revolution—the written and the customary law. The latter varied greatly in the different judicial centers, and many consolidations had been unsuccessfully attempted. The confusion remained until 1789, when the Constituent Assembly attempted the task. Napoleon approved, and appointed a commission to draw up a code. This was accordingly done, the code being based upon the existing French legal traditions and upon ancient law. The work was subjected to criticism forthwith; but in the midst of the discussion Napoleon withdrew the code, expelled the op-

position, and divided the remainder into committees which were to discuss the clauses with the *Conseil d'Etat*. By 1810 their work was finished. The code is divided into five portions: (1) The *code civil*; (2) the *code de procédure civile*; (3) the *code de commerce*; (4) the *code d'instruction criminelle*, and (5) the *code pénal*. These portions are independent of one another. All previous legislation was superseded by this code; and it has been largely copied throughout Europe. Its brevity has been condemned by some, who point out a lack of definiteness and clearness of statement. It leaves much to the judgment and good sense of the court. Naturally this has brought about considerable conflict of decisions, and given birth to a large number of legal commentaries. Precedents are not considered binding in France; and there is always, therefore, some doubt as to what the decision in any given case may be.

COFFEE-HOUSES.—Coffee-houses as rivals of liquor taverns have been favored almost from the beginning of the active temperance agitation. As early as 1830 and 1831 there was a coffee-house movement in Scotland, under the auspices of temperance societies, resulting in the successful operation of such establishments in nearly all the principal towns and cities, but many of them at that time sold the lighter alcoholic beverages as well as tea and coffee. It was in protest against this practice that the Dunfermline Society, September 21, 1830, formed itself into the "Dunfermline Association for the promotion of temperance by the relinquishment of all intoxicating liquors," and passed a resolution agreeing "to give no encouragement or support to any coffee-house established or receiving countenance from any temperance society, for the sale of intoxicating liquors" (Dawson Burns's *Temperance History*, vol. i., p. 48). In 1844 (*ibid.*, p. 248) "the coffee-houses of Glasgow, conducted on strict temperance principles, and provided with news-rooms, etc., were in some respects much superior to the coffee-taverns and palaces of the present day." But it is more recently, and in England especially, that the coffee-house has become a prominent feature of the temperance movement. Liverpool, Birmingham, Bradford, and other large cities in England are plentifully supplied with these places, while in London, where the development has been slower, a large number of establishments have been opened by the Lockhart Coffee-House Company, with the prospect of a rapid increase in the number. Two weekly newspapers in London, the *Temperance Caterer* and the *Refreshment News* (the latter the organ of the Coffee-Tavern Protection Society) are especially devoted to the coffee-house movement and its interests. In 1872 Rev. Charles Garrett conceived the idea of a coffee-saloon in Liverpool, which should combine every attraction of the liquor-saloon except the bar, and a company was formed, and such a place, with reading-room attached, was opened near the docks. Refreshments were served at the cheapest rates. The enterprise was so successful that there are at present in Liverpool more than 60 of these cocoa-rooms, as they are called, while

the British Workman's Cocoa-House Company, of Liverpool, which has them in charge, has in no year paid less than 10 per cent. dividends. Coffee-houses were established in Bradford after their success was manifest in Liverpool, and the Bradford Coffee-House Company has opened 20 places in that city and its suburbs. Birmingham also is plentifully supplied with coffee-houses, or coffee-house hotels, and they are successful from a business point of view, as well as influential in molding temperance sentiment. The coffee-house movement has extended into Canada and Australia, but has made little progress in the United States. Probably the nearest approaches to the English coffee-house to be found in this country are the temperance restaurants established in various cities by enterprising or philanthropic persons, those opened and very successfully managed by Joshua L. Baily, in Philadelphia, being especially worthy of mention.

Another form of the coffee-house work is found in the rooms opened in Boston by the New England Department of the Church Temperance Society. The emphasis is placed in these rooms upon the social aspect, very little attention being paid to the sale of food and drink. Pool tables and other games are provided, smoking is allowed, and the aim has been to afford all the *freedom* of the bar-room without the slavery, which is the penalty that has to be paid in places where social freedom means social drinking. Once a week in each of these rooms a program of entertainment and instruction is provided, and one of the greatest successes of this kind of work has been found in the number of cultivated men and women who come to talk about anything which interests themselves and in the yearly improving attention and appreciation on the part of the young men who frequent the rooms. Now and then the talk will be a religious one, but, as a rule, these are not preaching places.

There is always plenty of water, for those who visit these rooms are thirsty people. As a rule they prefer water to coffee. The rooms are smoky; tobacco is not sold, but there is no restriction upon smoking.

General good order prevails; when parties get turbulent beyond control, the doors are labeled "closed for a week on account of disorder," and in every instance the disturbers, missing their privileges, have returned and apologized.

The general idea is, of course, to make the rooms as nearly like a liquor saloon as possible, without the liquor. But good reading matter, illustrated papers, etc., in abundance is provided.

The mere fact that, at the lowest estimate, the attendance in the Boston coffee-rooms has averaged during some seasons over 300 young men each night, is a sufficient argument for going on with the work; for this average of 300 a night means an attendance during one month of 7800; during six months, of 46,800; during four years, of 187,200.

COGNETTI DE MARTIIS, SALVATORE, was born at Bari, Italy, in 1844, and in 1868 became a professor in the Institute of

Technology of that place. The next year he accepted a similar position in Mantua, and in 1876 became Professor of Political Economy in the University of Turin. Professor Cognetti, according to Cossa, may be classed with the Italian sociological school. He has especially studied the economic functions of animal and savage life, and by investigations in philology, etc., has thrown much light on the origins of socialism in antiquity. He has, however, studied modern economic conditions, and particularly those of the United States. Among his best-known books are *Delle Attinenze tra l'economia sociale e la storia* (Florence, 1866); *Le Forme primitive nell'evoluzione economica* (Turin, 1881); *Il Socialismo negli Stati Uniti d'America* (Turin, 1887); and *Socialismo Antico* (1889).

COHN, GUSTAV, born December 12, 1840, at Marienwerder, in West Prussia; studied in Berlin and Jena; Fellow of the Royal Statistical Seminary of Berlin, 1867-68, afterward at Heidelberg and the Polytechnic at Riga. In 1873 he visited England, and as a result of his studies published his *Untersuchungen über die englische Eisenbahnpolitik*. In 1875 he was called to the Polytechnic at Zurich, and in 1884 as regular professor to the University of Göttingen. One of the foremost economists in Germany, his writings have been numerous. Perhaps his best-known works are his *System der Nationalökonomie* (1886), in which his chapters on cooperation, the normal labor day, and freedom of industry are of special value; and his *Finanzwissenschaft* (1889). His studies of the Swiss and German system of taxation are of the highest value.

COIT, STANTON, was born in 1857 in Columbus, O.; graduated at Amherst, 1879, and took the degree of Doctor of Philosophy at Berlin, 1885. Studying social conditions, and living himself in a tenement among the poor, he founded the Neighborhood Guild (*q.v.*) in the Tenth Ward in New York City in 1887, and became one of the founders, and for two years head worker of the University Settlement in that city. He was for several years lecturer with Professor Adler (*q.v.*) of the New York Society for Ethical Culture. In 1888 he succeeded Mr. Moncure D. Conway, in London, as lecturer of the South Place Ethical Society, and instituted a Neighborhood Guild in London, and later founded and became head of the West London Ethical Society. He was one of the founders and is still one of the associate editors of the *International Journal of Ethics*. His main works are *Neighborhood Guilds*, both in English and German; *Die ethische Bewegung in Religion*, issued in Germany, and several lectures in one volume, translated into French and published as *La Religion basée sur la morale*.

COINAGE (see also CURRENCY) is the fashioning of pieces of metal and impressing upon them suitable devices for use as money. The first coins were probably simple pieces of metal marked as containing a certain weight, the names of many early coins being identical with denominations of weight. The earliest writers, too, give values in definite weights. The in-

vention of coined money is claimed by Herodotus for the Lydians, and the coins of Sardis of 800 B.C. are known. Ægina is said to have had coins in 750 B.C. The Chinese, however, claim to have coined money in B.C. 3289, and Williams recognizes their claim to have coined money at least as early as B.C. 2356. Coins were probably first issued by individuals and later by governments. To-day it is all but universally recognized that to coin money is the peculiar attribute of government alone. If individuals coined money some might do it honestly, but some might do it dishonestly, and the ignorant and inexperienced might thus easily be defrauded. For United States coinage see CURRENCY.

COLBERT, JEAN BAPTISTE, born at Rheims, 1619; died at Paris, 1683. His father was a wool merchant. He rose from office to office, till he became one of the greatest ministers France has ever had. In 1661 he became comptroller-general. His first reform was to reduce the *taille*—a direct property tax—and to establish a departmental office. He was especially noted for his love of system and regularity in industry and commerce. Frequently his regulations were strict even to severity. His economic method was to organize industry, sustain it by custom-house regulations and protection, and to create model manufactures by grants of money or privilege. All financial dishonesties he strove with laudable severity to check. His mind was not sufficiently profound to establish a complete system; he dealt with immediate difficulties, and overcame them by his energy and good sense. He interested himself in the shipping trade and in the arts and sciences, encouraging the arts by liberal presents and pensions. In 1663 he founded the Academy of Inscriptions and Belles Lettres, and in 1668 the Academy of the Sciences.

COLINS, JEAN GUILLAUME CÉSAR ALEXANDRE HIPPOLYTE, Baron de, was born at Brussels in 1783. He entered the French army at an early age, and won many honors. In 1833 he settled down to a quiet life, and pursued at Paris his scientific and social studies. In 1835 he issued his first work, entitled *Le Pact Social*. In it he advocated collectivism, and declared that "immovable property belongs to all." Numerous other works on social questions followed, and he continued to write until his death in 1859.

Colins and his disciples call their system Rational Socialism. They believe in spiritualism and atheism, as they deny the existence of a God, while at the same time affirming the immortality of the human soul. Morality, they say, is sufficiently based upon personal immortality. All men are equal, free, moral, and therefore responsible beings. M. de Laveleye, in his *Socialism of To-day*, gives the following concise account of their economic doctrines:

"As man is a responsible agent, his every action must infallibly and inevitably be rewarded or punished according as it does or does not conform to the rules imposed by his conscience; and this sanction, in order to be inevitable, must take place in a subsequent existence.

"The aggregate of indisputable reasonings constitutes 'impersonal reason,' which, when looked upon as prescribing a rule of action, may be called 'sovereignty.'

"From the 'immateriality of the sensibility' flow, according to Colins, other consequences touching man's relations to the material world, that is to say, touching his social economy. Man alone, he says, works; man alone is an *agent*, properly so called. The material world is the *patient* on which man acts with the aim of producing something. Originally there existed only man and the earth on which he lived: on the one hand, labor; and on the other, the soil or raw material, without which all labor would be impossible. But from the joint action of these two elements of production there soon came into being wealth of a peculiar kind, in which labor was, as it were, accumulated, which was movable and separate from the soil. This was capital. It assists production and is the handmaid of labor, but in order to make use of it, a material to which it can be applied is indispensable. From the necessity to which man is subject for a material on which to expend his labor, there results, according to Colins, the following important consequence: Labor is free when the raw material, the soil, belongs to it; otherwise it is enslaved. Man therefore can, in fact, only exercise his energy with the permission of the owners of the raw material; and he who requires the authority of another before he can act is clearly not free. In order, then, that all the members of the community should become permanent proprietors of the national soil, the soil must be collectively appropriated.

"The collective appropriation of the soil implies, in the first place, that it should be at the disposal of all who wish to utilize it; and secondly, that the rent, paid by the tenants to the community, should be expended for the common benefit of all. According to the Belgian socialist, there are only two entirely distinct methods of holding land: first, that adopted at the present day, in which the soil is given up to individuals, or to certain classes of individuals, and labor is enslaved; secondly, the system of the future, under which the soil will be collective property, and labor will be free.

"The above relates to the production of wealth. Let us now consider the way in which rational socialism regulates its distribution.

"When labor is free—as is necessarily the case when the land is accessible to all—every one can live without being obliged to accept wages from anybody. In that case, a man would work for others only if they offered him, as wages, more than he could gain by working for himself. This situation is expressed in economic terms by saying that then wages would tend to a maximum, and when it exists, the distribution of wealth is so affected that the larger share of the product goes to labor and the smaller to capital. But when labor is enslaved, the laborers are forced under pain of starvation, to compete with one another in offering their labor to those who possess land and capital; and then their wages fall to what is strictly necessary for existence and reproduction; while if the holders of wealth do not need labor, the unemployed laborers must disappear. Wages, then, tend to a minimum, and the distribution of wealth takes place in such a way that the greater part goes to the landowners and capitalists, and the smaller to the laborers. When labor is free, every man's wealth increases in proportion to the toil he has expended; but when labor is enslaved, his wealth grows in proportion to the capital he has accumulated.

"From these two opposite modes of distribution flow, according to Colins, the two following consequences, each of which has reference to one or other of the two systems of holding land above described. When land is owned by individuals, the wealth of one class of the community and the poverty of the other increase in parallel lines, and in proportion to the growth of intellectual power; but when land is collectively appropriated, the wealth of all increases in proportion to the activity of each, and to the advance of civilization.

"Colins has also developed some original views on the history of communities, which have been reproduced by M. L. de Pottre in his *Dictionnaire Rationnel*."

COLLECTIVISM is a term used sometimes in this country, but frequently in France, to denote socialism as distinguished from anarchism or communism, both of which are sometimes, tho we believe wrongfully, included under socialism. Collectivism is also used sometimes to include both nationalism and socialism, where some might make a difference between these two.

COLLEGE SETTLEMENTS. See WOMAN'S COLLEGE SETTLEMENTS.

COLWELL, STEPHEN, born in Virginia in 1800, and admitted to the bar in his native State, relinquished the profession of law to become an iron merchant in Philadelphia, where he lived till his death in 1872. He studied and wrote much on political economy, being a protectionist. He was a frequent contributor to the periodicals of his time. His best-known work is *The Ways and Means of Commercial Payment*, published in 1858. In it he attempts to give a full analysis of the credit system, and contends that error has always been made in not distinguishing between money of gold and silver, and forms of credit. His work is also valuable because of its historical inquiry into the growth of the credit system, and reveals throughout independence of thought and research. He refused to accept the view that the quantity of money is the controlling factor in determining prices. In 1865 he was appointed a member of the revenue commission, and in the year following made a valuable report on taxation. Among his more extended writings may be mentioned *The Relative Position in our Industry of Foreign Commerce, Domestic Production, and Internal Trade* (Philadelphia, 1850), and an American edition of Frederick List's *National System of Political Economy* (Philadelphia, 1856), for which he wrote a preliminary essay. His other writings of economic interest are *The Claims of Labor, and their Precedence to the Claims of Free Trade; Gold, Banks, and Taxation and State and National Systems of Banks, Expansion of the Currency, the Advance of Gold, and the Defects of the Internal Revenue Bill of June, 1864*.

COMBINATIONS. See MONOPOLIES; STRIKES.

COMMERCE (from Latin *com*, together, and *mercari*, to trade) is sometimes used for the interchange of any goods or property, but more correctly for the interchange of goods on a large scale and between different countries or different portions of one country.

The first race to carry on commerce on a large scale was the Phœnician, first in Tyre and Sidon, and then in the Phœnician colony of Carthage. Much of the commerce of Rome was tribute rather than trade. With the breaking up of the Roman Empire commerce languished till the rise of the free cities of Italy, Venice, Florence, and Pisa. Commerce was also much quickened by the crusades. The free cities of Germany and the Netherlands, which formed the Hanseatic League, created a still greater commerce. The introduction of the mariner's compass into Europe in 1302 and the discovery of the New World and of the Cape of Good Hope vastly developed commerce, particularly in Spain, Portugal, and England, and later in the Netherlands. By the seventeenth century Spain and Portugal had lost their prestige, and England has become the great commercial nation of the world. In medieval times commerce was greatly restricted by dues, taxes, and laws. After the discovery of the New World,

governments tried to favor commerce by granting monopolies, trading privileges, etc., often doing more harm than good. Since the beginning of the present century *laissez faire* has been the general policy. But see PROTECTION.

Enormous strides have been made within this century in the development of commerce. At the beginning of the century men lived to a very large extent in isolated communities. Only a few good roads existed. Even in England rivers rather than roads were the channels of commerce. It took many days to go from Edinburgh to London in the speediest way. When the battle of Waterloo was fought (1815) it took three days for the news to arrive in London. Dr. Atkinson as late as 1847 was eight months in going from New England to Oregon; he returned in six days. Foreign commerce was largely limited to voyages made by ships fitted out or chartered for the special trip, and often a commercial venture of the captain himself. Each nation and each section of the nation had to raise its own food. Hence the failure of a crop in one locality meant a famine, and famines were numerous. To-day the world has become a single market. The use of steam as a motor power on land and sea, and the use of electricity for conveying intelligence has revolutionized commerce. Merchants in England make purchases in India the same day, and on the next day the purchased goods start on their journey. The Suez Canal has reduced the voyage between London and Calcutta to 30 days instead of 200. It has destroyed 2,000,000 of tonnage. Fresh fruit, raised in California, is sold in London. Fresh meat is carried from New York to Liverpool for one cent a pound. Boxed meats have been carried from Chicago to London at one half a cent a pound. The productions of North America, South America, Australia, Russia, and Egypt battle for the English market. It has been calculated that railways have added to the power of the human race a force somewhat greater than that of a horse working 12 days for every inhabitant of the globe. It cost \$10 in 1887 to do railroad service which before the railroad would have cost \$200, and therefore usually was not done (Wells' *Recent Economic Changes*). In 1879 the railways of Great Britain conveyed 629,000,000 passengers (Mulhall). Says Dr. Strong, in *Our Country*:

"Any one as old as the nineteenth century has seen a very large proportion of all the progress in civilization made by the race. When seven years old he might have seen Fulton's steamboat on her trial trip up the Hudson. Until 20 years of age he could not have found in all the world an iron plow. At 30 he might have traveled on the first railway passenger train. Fifty years later the world had 220,000 miles of railway. For the first 33 years of his life he had to rely on the tinder-box for fire. He was 38 when steam communication between Europe and America was established. He had arrived at middle life (44) when the first telegram was sent. Thirty-six years later the world had 604,000 miles of telegraph lines."

Nor is the tide of progress ceasing. It has increased almost more in the latter portion of the century than the first. Steamers constructed in 1870 to 1873 were largely displaced in 1876 or sold at half price. Freight rates on grain from Bombay were 32.5 cents per bushel in 1880 and 16.2 cents in 1885. In 1870, 47 hands were employed for every 1000 tons capacity entered or

cleared in the British mercantile marine ; in 1885 only 27.7 hands were necessary. In 1860, 12 cents were the lowest rate that lasted for any time for transporting a bushel of grain from New York to Liverpool ; but in 1885 the average rate was 5 cents. The average charge for

moving one ton of freight by rail in the United States was 2½ cents in 1869, and 1.06 in 1887 (Wells' *Recent Economic Changes*). Perhaps, however, the best indication of the growth and importance of commerce is in the following tables :

AGGREGATE VALUE OF IMPORTS AND EXPORTS FOR VARIOUS COUNTRIES IN MILLIONS OF POUNDS STERLING, ACCORDING TO MULHALL'S DICTIONARY OF STATISTICS.

	1720.	1750.	1800.	1850.	1860.	1870.	1880.	1889.
Great Britain.....	13	21	67	169	375	547	698	740
France.....	7	13	31	95	167	227	339	311
Germany.....	8	15	36	70	130	212	294	367
Russia.....	8	14	30	49	48	103	131	118
Holland and Belgium.....	4	6	8	61	86	130	237	310
United States.....	17	62	136	165	308	320
Europe.....	62	103	228	576	1,024	1,573	2,134	2,313
The World.....	88	140	302	832	1,489	2,191	3,033	3,377

The trade of the world in millions of pounds sterling is given by Mulhall as :

	Imports.	Exports.
1861-70.....	9,228	8,301
1871-80.....	13,787	12,157
1881-86.....	9,771	8,961

The total imports and exports of Great Britain per inhabitant have been, according to Mulhall :

	£	s.	d.
1355.....	..	2	10
1573.....	..	15	..
1687.....	1	10	2
1750.....	2	10	..
1790.....	3	18	..
1800.....	6	8	..
1810.....	5
1820.....	3	10	..
1830.....	3	14	..
1840.....	4	4	..
1850.....	6	4	..
1860.....	12	17	..
1870.....	17	7	..
1880.....	20	5	..
1889.....	19	10	..

The total imports and exports of the United States per inhabitant down to 1860 were, according to Mulhall :

	\$
1790.....	11.50
1800.....	16.25
1810.....	14.50
1820.....	12.00
1830.....	8.75
1840.....	11.50
1850.....	13.50
1860.....	21.50
1870.....	20.25
1880.....	30.75
1889.....	25.00

From 1867-94 inclusive the per capita foreign commerce of the United States is given by the United States Bureau of Statistics as follows :

The chief imports from 1826 to 1886 were in millions of dollars : Sugar, \$2315 ; coffee, \$1380 ; woolsens, \$1710 ; cottons, \$1245 ; silks, \$1310 ; linens, \$630 ; iron manufactures, \$565. The chief exports were : Cotton, \$6625 ; grain, \$3510 ; meat, \$1540 ; petroleum, \$825 ; tobacco, \$950.

YEARS.	Merchandise Imported for Consumption per Capita.	DOMESTIC MERCHANDISE.		Imports and Exports of Merchandise Carried in American Vessels.
		Exports, per Cent.	Exports of Agricultural Products (per Cent of Total Exports.)	
1867.....	\$10.44	\$7.73	75.34	Per Cent. 33.87
1868.....	9.33	7.29	70.19	35.11
1869.....	10.43	7.29	75.35	33.18
1870.....	11.06	9.77	78.40	35.59
1871.....	12.65	10.83	70.74	31.87
1872.....	13.80	10.55	74.13	29.15
1873.....	15.91	12.12	76.10	26.37
1874.....	13.26	13.31	79.37	27.77
1875.....	11.07	11.36	76.95	26.21
1876.....	10.29	11.64	71.67	27.67
1877.....	9.49	12.72	72.63	26.91
1878.....	9.21	14.39	77.07	26.31
1879.....	8.09	14.29	78.12	22.99
1880.....	12.51	16.43	83.25	17.43
1881.....	12.68	17.23	82.63	16.49
1882.....	13.64	13.97	75.31	15.77
1883.....	13.05	14.98	77.00	16.04
1884.....	12.16	13.20	73.98	17.16
1885.....	10.32	12.94	72.96	15.29
1886.....	10.89	11.60	72.82	15.52
1887.....	11.65	11.98	74.40	14.30
1888.....	11.88	11.40	73.23	13.98
1889.....	12.10	11.02	72.87	14.34
1890.....	12.35	13.50	74.51	12.87
1891.....	13.36	13.63	73.69	12.46
1892.....	12.44	15.53	78.69	12.34
1893.....	12.64	12.44	74.05	11.54
1894.....	9.32	12.73	72.28	13.30

The specie value of merchandise exported and imported in millions of dollars is given by the Bureau of Statistics as follows :

	Exports.	Imports.
1845.....	106	113
1855.....	218	257
1865.....	166	238
1875.....	513	533
1885.....	742	577
1894.....	802	654

How small a portion this foreign commerce of the United States is of the total commerce can

be seen by a few figures. In 1890 the total exports were \$857,828,684 (including both domestic and foreign exports), but the total value of simply the articles manufactured in that year was \$9,372,437,283. There were mined in that year and largely transported, often a long ways, 140,882,729 tons of coal; 9,202,703 tons of pig iron were produced. The three larger cereal crops alone were valued at \$1,311,255,615. (See also EXPORTS; IMPORTS; MANUFACTURES; AGRICULTURE, etc.)

COMMERCIAL CRISES. See CRISES.

COMMERCIAL FAILURES. See BANK FAILURES; BANKRUPTCY.

COMMON CARRIERS.—The law distinguishes between *private or special carriers* and *common carriers*. By the former are meant persons who carry persons or goods not as a business, but only on occasion or by special agreement. *Common carriers* are those who carry as a business, inviting the employment of the public generally. The latter are bound by the law to serve without favoritism all who desire to employ them, and are liable for the safety of all goods intrusted to them except by losses from the act of God or from public enemies, or unless special exemption has been agreed upon. In respect to persons, they are liable for injuries which they might have prevented by special care. Drivers, log drivers, and others who do not literally carry property have been in part exempted, also telegraph companies. (See STRIKES; FRANCHISES; MUNICIPALISM, etc.)

COMMON LAW.—It is generally considered and has been expressly recognized by the courts of the United States that the common law of England is the basis of American law, on the well-known English doctrine "that whenever a new and uninhabited country was found out by English subjects, as the law is the birth-right of every subject, so, wherever they go, they carry their laws with them, and therefore such new-found country is to be governed by the laws of England, tho after such country is inhabited by the English, acts of Parliament, made in England without naming the foreign plantation, do not bind them."

Ordinarily in the United States those States which constituted the original thirteen colonies fix upon the time of their settlement as the date at which the decisions and statutes made in England cease to form part of their common law. The other States generally agree upon the year 1607, the year of the earliest English colonization. Yet principles which were established in England after these dates are in many cases regarded as parts of our municipal law. To prove a certain principle part of our common law it is not now required that it should have been practically enunciated before 1607. If the principle involved was recognized before that date, it is regarded as sufficient, without requiring a precedent for every practical application of the principle. In short, to sum up the varying authority of English law:

"English precedents prior to the settlement of this country are looked upon as of binding authority, except in so far as they are affected by the peculiar condition

and requirements of our citizens. Such precedents rendered subsequent to the settlement and prior to our independence are viewed with great deference, but are not deemed absolutely conclusive. Such precedents rendered subsequent to our independence are accounted worthy of respect and attention, but have no further weight attached to them."

Whatever portions of the United States which have been acquired by treaty or purchase retained their previous systems of law until abrogated by the proper authorities and replaced by new enactments.

The common law may be called an unwritten one, having been in some cases handed down as a mere tendency. In some particulars the traditions have taken definite form, as in the law of primogeniture, the jurisdiction of the courts, etc. Most of the laws have been developed since the last century. Few are of great antiquity. It thus naturally follows that conflicting decisions are given since the common law is so indefinite and traditional. It has never yet been systematized to a regular code. A court may even reverse its own decision, if sufficient reason is shown for so doing. Where all decisions are consistent the law is regarded as established. Any single decision may be set aside by equal, tho not by inferior, courts. The maritime and ecclesiastical courts of England recognize some of the rules of the civil and canon law as part of the common law. Almost any long-established custom may become part of the common law in England, especially if its practice dates from about the reign of Richard I.

COMMONS (see also LAND; COMMUNES; FEUDALISM). The first colonists of America divided land among themselves in proportion to the size of their families; and in some parts of New England according to rank. For many years, however, in Plymouth pasture lands were assigned by lot in town meetings, and wood was cut down and hauled in common. The forests were for more than a century known as "commons." In 1710 Plymouth comprised over 30,000 acres of common land, and to-day there are still over 200 acres of "town land," chiefly forest.

In the old town of Sandwich there is still a parcel of land known as the "Town Neck." This is owned by a company of 24 proprietors, the descendants or heirs of the first settlers of the town. Originally the Town Neck, like other common lands, belonged to the whole town. In the town records, under the date May 22, 1658, stands the following note: "If an inhabitant wanteth land to plant, hee may have some in the Towne Neck, or in the common for six year and noe longer." Later, in 1678, April 6, townsmen are given liberty to improve Neck lands "noe longer than ten yeares, and then to be at the townsmen's ordering againe." In the year 1695 the use of the Town Neck was restricted to the heirs of original proprietors, and the land was staked out into 38 lots. The lots were not fenced off, and the whole tract continued to lie as a common field, under the authority of the entire body of proprietors, like the arable lands of a Germanic village community. In 1695, April 4, it was agreed that the Town Neck should be improved for the future as a common field, until the major part of those interested should see cause otherwise to dispose or improve the same. The common fence was to be made up, and a gate to be provided by May 1. A field-driver or hayward was to keep the Town Neck clear of creatures, and to impound for trespass. In 1700 it was voted that the Neck be cleared of creatures by April 16, and that no part of the land be improved for tillage other than by sowing.

Lately, it has been proposed to sell this land to a private company for the Cape Cod Canal, a proposal which the Massachusetts Nationalists have strongly

opposed. The above is only one instance of the survival of communal lands in New England. In Salem there were 10 fields which belonged each to a number of proprietors, who had individual rights, but were subject to communal authority, a majority vote being supreme. They were tilled, sown, reaped in common. And this was only a part of their communism. The forests around Salem were long kept "for the commons of the town, to serve it for wood and timber." No townsman could make profit by exporting the logs or lumber, but every man was free to take all he needed for fencing, fuel, or building purposes. Like many other towns, Salem had large tracts of meadow land, where every man had liberty to mow. After the grass crop had been gathered, the cattle of the town were turned into the meadows to graze. Along the Connecticut River this custom continued until quite recent times. Boston Commons was thus used for many generations. The Town Neck, in Salem, which is now a public pleasure ground, remained a common pasture for milk cows until lately. At present there are 300 acres of common land, called the "Great Pastures," being the last remnant of a vast tract of 4000 acres. It is owned by the descendants of the original commoners. In 1640 the town voted that "none of the commons within the cattle range should be granted to any individual use." Generally, however, the increase of population led to the gradual breaking up of the system of communism. It was, however, only after a long contest that the landless citizens triumphed over the village patricians. The immediate result of the abolition of common lands was very beneficial to the interests of the community, as the number of small landowners was increased.

It is not only in New England that traces of the early land communism appear, but in all English or Dutch settlements. There were commons in Nantucket, New York, New Jersey, Delaware, Pennsylvania, Maryland, Virginia, and the Carolinas. Almost everywhere in the South certain communal customs prevailed. Forests, streams, and foot-paths are generally regarded as common to all. The court-greens in Southern towns are as free as village greens or commons. Annapolis has a town pasture which is typical of scores of others. In the Southern parishes the glebe lands are only an ecclesiastical phase of the original communism, separated and administered by church boards for church purposes, similar to the town lands of New England, which yielded support to the schools and clergy.

Allen; the *Johns-Hopkins University Studies in Historical and Political Science*, vol. 1, No. 2, on *The Germanic Origin of New England Towns*, and Nos. 9 and 10, on *Village Communities of Cape Ann and Salem*.

COMMONS, JOHN ROGERS, was born at Hollandsburg, O., in 1862, educated in public schools, and graduated at Oberlin College. He studied political science at Johns Hopkins University in 1889-90, receiving the degree of A.M. from Oberlin in 1890. He became tutor in Economics at Wesleyan University, Middletown, Conn., 1890-91; Associate Professor of Political Economy at Oberlin, 1891-92, and since that time for three years Professor of Political Economy and Social Science in Indiana University, and since 1895 in Syracuse University. Deeply interested in social reforms, he was one of the founders of the American Proportional Representation League (*q.v.*), and was active in the American Institute of Christian Sociology (*q.v.*). He is author of *Distribution of Wealth*, published by Macmillan (1893), and *Social Reform and the Church*, published by Crowell & Co. (1894). He belongs to no one school except as holding to the so-called ethical view of political economy. He favors a tariff on products where there is domestic competition, free trade where there is domestic monopoly, but holds the tariff of minor importance. He favors the nationalization and municipalization of natural monopolies, and the complete governmental control of currency. This year

(1896) he has published another book, *Proportional Representation*.

COMMUNE OF PARIS. See PARIS COMMUNE.

COMMUNE, COMMUNALISM, AND COMMUNARDS.—A commune (from Latin *communis*, common) is in general a community organized, or the government of such a community. Under the Roman Empire every province appears to have had its own provincial diet or assembly, called a *concilium* or *commune*, and these are held by some to have been the first attempts at representative assemblies. But see COMMUNISM; MIR, etc. In the Middle Ages many cities and towns formed confederacies of citizens, and all such confederacies of towns or provinces were called communes. We read of the Commune of Florence, the Commune of Paris, etc. In France especially these communes at one time developed very considerable power and obtained large rights which they gradually lost under the centralizing tendencies of the government of the Louis. Beginning with the Revolution, however, there has been a constant agitation for, and some serious insurrections in order to gain, the supremacy of the old *communes*. This has led to a theory particularly popular in France, which would make the commune the political and social center, and do away with all central government save a loose federation of communes. This was the ideal of Bakounin (*q.v.*), and is the view of most anarchist communists. (See ANARCHISM, section "Anarchist Communism.") It was this theory that largely led to the rising of the Paris Commune (*q.v.*) in 1871. One who advocates this view is sometimes called a *communard*, tho this phrase has been particularly appropriated for the supporters of the Paris Commune. Professor R. T. Ely and other writers, however, prefer the word *communalist* for the believer in this theory. (See also COMMUNISM; PARIS COMMUNE.)

COMMUNISM, the economic theory which advocates the total or partial abolition of the right of private property, actual ownership being ascribed to the community as a whole or to the State. Says Palgrave's *Dictionary of Political Economy*:

"Communism is the theory which teaches that the labor and the income of society should be distributed equally among all its members by some constituted authority. For an example of what communists mean by equal division of labor and income, the following explanation may suffice: 'Here equality must be measured by the capacity of the worker and the need of the consumer, not by the intensity of the labor and the quantity of things consumed. A man endowed with a certain degree of strength, when he lifts a weight of 10 lbs., labors as much as another man with five times the strength when he lifts 50 lbs. He who, to satisfy a burning thirst, swallows a pitcher of water, enjoys no more than his comrade who, but slightly thirsty, sips a cupful. The aim of the communism in question is equality of pains and pleasures, not of consumable things and workers' tasks' (Buonarroti, *Conspiration de Babeuf*, i. 297)."

Says John Stuart Mill (*Political Economy*, Book II., chap. i.):

"The assailants of the principle of individual property may be divided into two classes: those whose scheme implies absolute equality in the distribution of

the physical means of life and enjoyment, and those who admit inequality, but grounded on some principle, or supposed principle, of justice or general expediency, and not, like so many of the existing social inequalities, dependent on accident alone. At the head of the first class, as the earliest of those belonging to the present generation, must be placed Mr. Owen and his followers. M. Louis Blanc and M. Cabet have more recently become conspicuous as apostles of similar doctrines (though the former advocates equality of distribution only as a transition to a still higher standard of justice, that all should work according to their capacity, and receive according to their wants). The characteristic name for this economical system is communism, a word of continental origin, only of late introduced into this country. The word socialism, which originated among the English communists, and was assumed by them as a name to designate their own doctrine, is now, on the Continent, employed in a larger sense; not necessarily implying communism, or the entire abolition of private property, but applied to any system which requires that the land and the instruments of production should be the property, not of individuals, but of communities or associations, or of the government."

This is probably the best use of the word, though there is some authority for using the word "communism" simply as identical with extreme and radical socialism. It is unnecessary, however, to use two words for the same thing, and communism is being limited more and more by the best writers to apply to that school of socialists who believe in holding all property in common, except the merest personal effects, and giving to every man equally, in contradistinction to socialists, who would only have capital, or the means of production, in common.

HISTORY.

Communism has always existed, to more or less an extent. According to Laveleye (*q.v.*; see also PROFERTY) and many other sociologists, communism was the earliest known form by which property was held, as evidenced in existing conditions among the North American Indians and most savages, and as witnessed to by the Russian *Mir*, the Javan *Dessa*, and many other Asiatic and European survivals from primitive forms. This

has been strenuously denied by some authorities, notably by Fustel des Coulanges; the denial is more apparent than real, since they admit that property was held by some great chief or strong man for the community fraternally or feudally rather than in the ordinary sense of private property. The Buddhist monasteries, where the devotees renounced marriage and property, are another early communistic attempt. Pythagoras, Plato and Aristotle and other Greeks largely favored communism. (See PLATO; ARISTOTLE.) Some of the Jews, the Essenes and Therapeutæ taught and practised communism. (See ESSENES. See also PROFERTY.)

The early Christian Church was, in places at least, undoubtedly largely communistic. (See CHURCH AND SOCIAL REFORM.) We are distinctly told of the first Christian church at Jerusalem, that they had all things in common. It was, however, a perfectly voluntary communism. Christians were not required to renounce private property. Peter said to Ananias of the price of his land, part of which Ananias had kept back—"While it remained was it not thine own, and after it was sold, was it not in thine own power?" Yet the fact remains that, led by the power of love, some early Christians did practise communism. After the third century the Church became a much more worldly power, but in the fourth century the communistic tendency developed into the communistic monarchism of the anchorites and monks. Ever since there have been various communistic orders and sects appearing in the Christian Church—the Humiliates; the Beghards and Beguines; the various mendicant orders of the Middle Ages; the Brethren of the Free Spirit, in the thirteenth century; the Adamites, during the Hussite wars. This last advocated the community of women, and some of the other sects and orders degenerated into disorder and excesses; but, on the whole, considering

Medieval Communism.

the ages in which they appeared, they usually stood for the purest and most vital Christianity of their times. Often these communities of brotherly love were the only spots of quiet in the darkness and bloodshed of lawless ages. (See MONASTICISM AND MIDDLE AGES.)

The Reformation developed a new impulse toward communism, as indeed has been the case with every new religious movement. The Peasant War in Germany was largely an outcome of the communistic idea working out among the peasantry, but the influence mainly appeared in the organization of the Heavenly Prophets, by Storch, the Anabaptists in Munster, the Libertines of Geneva, the Familists of Holland and England, and the Buchanites of Scotland. The communistic principle is also present in a purer form among the Herrnhuters (Moravians) and in some communities of Auvergne. In Germany many communistic sects arose in the eighteenth century. (See ANABAPTISTS; PEASANT'S WAR; MORAVIANS, etc.)

The eighteenth century also saw a wave of communistic thought in France. Morely (*q.v.*), in his *Code de la Nature* (1755), taught that man naturally possesses every virtue, and is only depraved by bad institutions, the chief of which is private property. He declared that it would be "in conformity with the intentions of nature," if every citizen contributed to the resources of the State, in accordance with his strength, talents, and age, and in return were wholly maintained at the public expense. Mably (*q.v.*), who was a brother of Condillac, endeavored to show, in opposition to Mercier de la Riviere (*q.v.*), that private property in land is not the natural and necessary basis of society. On the contrary, he said, society could exist without property, as is proved by the cases of Sparta, the Jesuits in Paraguay, and the monastic orders; while the establishment of property in land and inequality of condition has been the great source of avarice, ambition, and vanity.

Babeuf (*q.v.*) and his fellow-conspirators of 1796, calling themselves the "Equals," were the most remarkable representatives of this thought. In the Babouvist Utopia, as described by Buonarroti, every one is allotted two different occupations, the one light and the other hard. To give variety and change of scene, all are employed by turns in the transport and postal services. Those who will not work are treated as thieves. Education, carried on in vast boarding-schools, subordinates the family to national life. Distribution is to follow the strictest equality. In England Robert Owen is the great teacher of communism; but for his views, see OWEN.

The Reformation.

The Eighteenth Century.

COMMUNISM IN AMERICA.

The history of American communism divides itself into three portions: Religious, Fourierite, and what may be called, for lack of a better name, Secularist Communisms. The religious communities were the first, and have been, on the whole, the largest and the most successful. The Fourierite communities have been the most brilliant. The secularist communities have been the most varied and the most numerous.

Many of the early colonists practised principles and forms somewhat communistic. Both at Plymouth and Jamestown some land was held in common. (See COMMONS.) The Labadists in Maryland (1684-1722), Johann Kelpius' colony of "The Woman in the Wilderness," in what is now Philadelphia (1605-1704), the Dunker celibates at Ephrata in Lancaster County, Pa. (1713), and a community at Snowhill, near Harrisburg, Pa. (1820), all practised more or less communism. Better known are the Shakers (*q.v.*), or more exactly, the Shaking Quakers, followers of "Mother" Ann Lee. Their first establishment, Mt. Lebanon, in Columbia County, N. Y., is still the home of the strongest Shaker settlement in the land, existing and growing in wealth to-day, after a history of 104 years, a living contradiction to those who consider communism utterly beyond the pale of practicality. Living in groups or families, quietly, working in common for the good of all, and practising equal enjoyment of whatever is produced, economic failure they have never known, and to the future they look forward with steadfast hope. Their religious tenets we cannot here discuss. Suffice it to say they enter upon their communal life with religious conviction, and carry it on in a spirit of the deepest duty. That,

Religious Communism.

however, the Shaker communities are a complete success by no means believe; that they will continue to endure we are more than doubtful. Their religious spirit and their character of faithfulness and honesty have been their safeguard. The latter will, doubtless, remain with the faithful few, but how if advancing thought and education undermine their religious faith, and men and women decline to become followers of Ann Lee? Already, in spite of economic success, their communities seem slowly dwindling. (See SHAKERS.)

Next in age, and perhaps next in importance among the religious communists, stand the Harmonists, or the followers of George Rapp. George Rapp was born in Württemberg in 1757, and came to this country with a little band of followers in 1803. Settling first in Pennsylvania, they moved soon to Harmony, Ind., and, later, in 1824, selling out to Robert Owen, they went to Economy, near Pittsburg. Practising celibacy, they are dependent upon converts for numerical growth, and converts do not come. Their communism is also a part of their religion and, as they believe, the consequence of Christianity. It makes them faithful, honest, successful, but the spirit of to-day hungers for something larger than the straitened tenets of these German dissenters.

They are to-day enormously wealthy, largely through investments of their first earnings; but the number of the society is very small, most of those now living at Economy simply being hired workers, and already there is talk of ending the community. (See ECONOMY.)

Württemberg seems to have been prolific in communists. In 1817, persecuted in their home, there came to this country a little band of Separatists, as they called themselves, led by Joseph Bäumeler, and with the assistance of some Quakers purchased land at Zoar, in Pennsylvania, where, practising communism, they exist to-day, prosperous and rich. Zoar and Amana—the latter being in Iowa—are the strongest communistic societies in the United States, excepting only the Shakers. Among Separatists marriage is allowed, and they number now some 300 or 400 souls. Professor R. T. Ely gave their wealth in 1886 as \$1,500,000, or a per capita wealth of \$5,000, against the average per capita wealth of the United States, which is not over \$1,000. Who shall say that communism cannot financially succeed? (See ZOAR.)

Next to Zoar comes Amana, another German colony of a sect beginning in the Fatherland in the eighteenth century, but not attaining strength till 1817, when Christian Metz became, as he believed, an "instrument" of revelation to lead his followers on to a higher and a communal life. They came to this country in 1842 and settled near Buffalo, N. Y., whence they removed to Ebenezer and later to Amana, in Ohio, in 1855. Amana is not a village, but a plain with seven villages all tied together in the bonds of communism. The Amana community believes in marriage and the family, and is upon the whole perhaps the broadest and most attractive existing communism in America. This community too is to-day very wealthy. (See AMANA.)

Among religious communities must undoubtedly be included the Oneida Community, or the "Perfectionists," established by John Humphrey Noyes, at Oneida, N. Y., in 1847, with a smaller community at Wallingford. Economically, this community too succeeded, being wrecked on other lines. But Noyes believed in what he would call collective marriage. He claimed that it was not free love, since the relations between men and women were not left to the shifting caprice of love or of desire, but were entered into with religious ceremony and thoughtfulness. Only one woman was not tied to one man, or *vice versa*, but all were tied together. Enduring many years, New York State was, on account of their marital practices, at last made too hot for them, and the community as a religious community dissolved in 1881, existing to-day only as a joint-stock concern for the management of their wealth. (See ONEIDA.)

Such have been the main but by no means the only religious communistic socialists in the United States. Hopedale, in Massachusetts, founded by Rev. Adin Ballou (*q.v.*), a relative of the great Universalist; Brockton, in New York State, founded by Thomas L. Harris, now of California, and author of *The New Republic*; Mountain Cove Community (spiritualistic), with the home of the Oaksites in Aurora, in Oregon, and Bethel, in Missouri, are all of interest, and have endured for a longer or shorter time successfully, most of them splitting, however, finally on the rocks of discord or of unwise management. Brook Farm might be considered a religious community, first Unitarian

or Transcendental and then Swedenborgian; but as it finally became a Fourierite phalanx, and belongs to the same epoch in time, we consider it under that head. (See HOPEDALE, etc.)

The Fourierite wave of communistic socialism swept over this country from 1840-50. In 1840 Albert Brisbane published his *Social Destiny of Man*, a presentation of Fourierism. In 1843 Horace Greeley opened the columns of the New York *Tribune* to the teachings of Brisbane, and socialistic articles appeared in its columns at first once a week and then every day. There was a rush into Fourierite communities or "phalanxes." "By 1843," say Noyes in his *American Socialisms*, "phalanxes by the dozen were on the march for the new world of wealth and harmony." A paper entitled *The Phalanx* was started and edited by Brisbane. In 1844 a national convention of associations was held at Clinton Hall, New York City, with George Ripley for president and Charles A. Dana, Brisbane and Horace Greeley among the vice-presidents.

The Sylvania Association was the first phalanx, and was located in Lackawaxen, Pa. It had 145 members and owned 2300 acres of land. Greeley was one of its officers. It existed two years and then failed, mainly from lack of management. There was said to have been not a practical farmer among them. It was the type of most of the Fourierite communities.

The North American phalanx was the most successful, enduring 12 years. Situated in Monmouth, N. J., it commenced in 1843 with 12 members and a capital of \$8000. By 1844, it had 77 members and a capital of \$28,000. In 1854 it suffered heavily from fire and then more from dissension, coming to an end in 1855.

Noyes, in his book, enumerates 34 phalanxes, most of them, however, too insignificant to deserve mention here. Undoubtedly the greatest and best of them all was Brook Farm, near Boston. It did not begin as a Fourierite phalanx. It was at first simply a cooperative farm and school under the lead of George Ripley. His thought, however, fell on friendly soil, and Boston's culture and Boston's genius joined the new enterprise. Not professedly religious, it was still largely Unitarian, or, more exactly, Transcendental. George Ripley, Dr. J. C. Warren, Theodore Parker, Margaret Fuller, and George William Curtis were all more or less interested, many of them being residents. Ralph Waldo Emerson and Dr. Channing were also interested, though not residents. *The Dial*, published from 1840-44 by Margaret Fuller, was its main organ. The best brains of Boston delighted to come here; its members discussed philosophy and milked cows and hoed potatoes, greatly to their enjoyment and their health, if not greatly to the benefit of their pockets. In 1844 it became avowedly Fourierite and then gradually went down, partly from misfortune in having its central house or phalanstery burned, partly because its interest was spasmodic and not enduring, mainly from lack of business management. In 1846 it was practically at an end.

The trouble with all the Fourierite communities was that they were fanciful and theoretical schemes, not simple and natural growths. They had little definite religious spirit to hold them together. They had little business headship. At the least discouragement and misfortune they melted away. Only religious communism, the facts seem to prove, can be successful.

We come now to the third class of communities, which, though the most numerous, are on the whole of the least importance. We have called them secularist communities, not because they all held secularist doctrines, but as indicating their opposition to any spiritual or revealed religion. The first and most interesting of these was New Harmony. In 1824, after his industrial experiments at New Lanark, in Scotland, Robert Owen, who may be almost called the father of English socialism, bought as above related, of the German Rappists, Harmony, and calling it New Harmony, established his colony. Entering into land and buildings prepared by the Rappists, some 900 persons were gathered from all portions of the United States. Education was made prominent; religious thought was unfettered; all worked for the good of all. Hope was on every hand. But there was no deep religious bond of union. Dissensions sprang up. Various methods of conducting the community were attempted, some wholly communistic, others only partly so; Mr. Owen was at one time sole manager, at another time a committee was elected to manage the community; separation was tried, to let different parties manage affairs in different ways, but the trouble lay not in the mode

Fourierism.

Secular Communities.

of management, but in the lack of the spirit of unity. In 1827 the community was virtually at an end. (See *NEW HARMONY*; OWEN.)

Akin to this, tho more enduring, was the non-religious community of Icaria, established in 1848 by some French followers of Cabet, the author of the charming communistic romance, *Voyage in Icarie*. Headed by Cabet himself, it numbered at one time 1500 souls, and for five or six years was successful. Dissensions, however, set in, and finally Cabet and 170 adherents departed and removed to St. Louis, Mo., where the enthusiast died in 1856, tho the community lingered on till 1895.

Such are the two main non-religious communities. Upon others, too numerous to mention, we need not dwell. They have all been unimportant.

Since the close of the Fourierite period in 1850 there has been no important movement toward communism till the present socialistic impulse, which is not yet over, and which has produced Kaweah in California, Topolobampo in Mexico, the Ruskin Colony in Tennessee, and other experiments. (See *KAWEAH*; *TOPOLOBAMPO*, etc.)

In England even John Ruskin, in his St. George's Community, attempted an artistic communism. (See *RUSKIN*.) He says in his *Fors Clavigera*: "For indeed I am myself a communist of the old school, reddest also of the red."

Concerning communism in general, Mill says (*Political Economy*, book ii., chap. i.):

"Whatever may be the merits or defects of these various schemes, they cannot be truly said to be impracticable. No reasonable person can doubt that a village community, composed of a few thousand inhabitants cultivating in joint ownership the same extent of land which at present feeds that number of people, and producing by combined labor and the most improved processes the manufactured articles which they

required, could raise an amount of productions sufficient to maintain them in comfort; and would find the means of obtaining, and if need be exacting, the quantity of labor necessary for this purpose from every member of the association who was capable of work.

"The objection ordinarily made to a system of community of property and equal distribution of the produce, that each person would be incessantly occupied in evading his fair share of the work, points, undoubtedly, to a real difficulty. But those who urge this objection, forget to how great an extent the same difficulty exists under the system on which nine tenths of the business of society is now conducted. The objection supposes that honest and efficient labor is only to be had from those who are themselves individually to reap the benefit of their own exertions. But how small a part of all the labor performed in England, from the lowest paid to the highest, is done by persons working for their own benefit. From the Irish reaper or hodman to the chief justice or the minister of State, nearly all the work of society is remunerated by day wages or fixed salaries. A factory operati^ve has less personal interest in his work than a member of a communist association, since he is not, like him, working for a partnership of which he is himself a member. . . .

"Another of the objections to communism is similar to that so often urged against poor laws: that if every member of the community were assured of subsistence for himself and any number of children, on the sole condition of willingness to work, prudential restraint on the multiplication of mankind would be at an end, and population would start forward at a rate which would reduce the community through successive stages of increasing discomfort to actual starvation. There would certainly be much ground for this apprehension if communism provided no motives to restraint, equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers, or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description, this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of over-popula-

tion, has the recommendation of tending in an especial degree to the prevention of that evil.

"A more real difficulty is that of fairly apportioning the labor of the community among its members. There are many kinds of work, and by what standard are they to be measured one against another? Who is to judge how much cotton spinning, or distributing goods **Difficulties.**

from the stores, or bricklaying, or chimney sweeping, is equivalent to so much plowing? The difficulty of making the adjustment between different qualities of labor is so strongly felt by communist writers, that they have usually thought it necessary to provide that all should work by turns at every description of useful labor: an arrangement which, by putting an end to the division of employments, would sacrifice so much of the advantage of cooperative production as greatly to diminish the productiveness of labor. Besides, even in the same kind of work, nominal equality of labor would be so great a real inequality, that the feeling of justice would revolt against its being enforced. All persons are not equally fit for all labor; and the same quantity of labor is an unequal burden on the weak and the strong, the hardy and the delicate, the quick and the slow, the dull and the intelligent.

"But these difficulties, though real, are not necessarily insuperable. The apportionment of work to the strength and capacities of individuals, the mitigation of a general rule to provide for cases in which it would operate harshly, are not problems to which human intelligence, guided by a sense of justice, would be inadequate. And the worst and most unjust arrangement which could be made of these points, under a system aiming at equality, would be so far short of the inequality and injustice with which labor (not to speak of remuneration) is now apportioned, as to be scarcely worth counting in the comparison. We must remember too that communism, as a system of society, exists only in idea; that its difficulties, at present, are much better understood than its resources; and that the intellect of mankind is only beginning to contrive the means of organizing it in detail, so as to overcome the one and derive the greatest advantage from the other.

"If, therefore, the choice were to be made between communism with all its chances, and the present state of society with all its sufferings and injustices; if the institution of private property necessarily carried with it as a consequence, that the produce of labor should be apportioned as we now see it, almost in an inverse ratio to the labor—the largest portions to those who have never worked at all, the next largest to those whose work is almost nominal, and so in a descending scale, the remuneration dwindling as the work grows harder and more disagreeable, until the most fatiguing and exhausting bodily labor cannot count with certainty on being able to earn even the necessities of life—if this, or communism, were the alternative, all the difficulties, great or small, of communism would be but as dust in the balance. But to make the comparison applicable, we must compare communism at its best with the *régime* of individual property, not as it is, but as it might be made.

"The perfection both of social arrangements and of practical morality would be to secure to all persons complete independence and freedom of action, subject to no restriction but that of not doing injury to others; and the education which taught, or the social institutions which required them, to exchange the control of their own actions for any amount of comfort or affluence, or to renounce liberty for the sake of equality, would deprive them of one of the most elevated characteristics of human nature. It remains to be discovered how far the preservation of this characteristic would be found compatible with the communistic organization of society. No doubt this, like all the other objections to the socialist schemes, is vastly exaggerated. The members of the association need not be required to **Freedom.**

live together more than they do now, nor need they be controlled in the disposal of their individual share of the produce, and of the probably large amount of leisure which, if they limited their production to things really worth producing, they would possess. Individuals need not be chained to an occupation or to a particular locality. The restraints of communism would be freedom in comparison with the present condition of the majority of the human race. The generality of laborers in this and most other countries have as little choice of occupation or freedom of locomotion, are practically as dependent on fixed rules and on the will of others as they could be on any system short of actual slavery:

to say nothing of the entire domestic subjection of one half the species, to which it is the signal honor of Owenism and most other forms of socialism that they assign equal rights, in all respects, with those of the hitherto dominant sex. But it is not by comparison with the present bad state of society that the claims of communism can be estimated. . . .

"It is yet to be ascertained whether the communistic scheme would be consistent with that multiform development of human nature, those manifold unlike-nesses, that diversity of tastes and talents, and variety of intellectual points of view, which not only form a great part of the interest of human life, but by bringing intellects into a stimulating collision, and by presenting to each innumerable notions that he would not have conceived of himself, are the mainspring of mental and moral progression."

COMMUNIST ANARCHISM. See ANARCHISM, Section II.

COMMUNITIES.—A community may be defined in a general way as any body of persons living together in one place or under one régime. It follows that all communities are not necessarily communistic. (For those that are communistic, see COMMUNISM; for monastic communities, see MONASTICISM; for the early or primitive communal life, see PROPERTY, also MIR; for various community experiments, see AMANA; BROOK FARM; ECONOMY; ICARIA; KAWEAH; NEW HARMONY; NORTHAMPTON; ONEIDA; RUSBER COLONY; SHAKERS; TOBOLOBAMPO, etc.) It must not be forgotten, however, that there are communities which come under none of these heads, but which consist of bodies of persons establishing a new village, town, or group of people who desire to live in a certain way or under certain conditions. Often a company will be formed to buy land, open it up, and sell it to emigrants or people, who will improve it according to certain methods or on certain conditions. Several important Western cities and towns have arisen in this way. Greeley, Col., is an instance of this. Important instances of colonies which form real communities and are yet by no means communistic are the Jewish colonies established in New Jersey by the Baron Hirsch Fund. The largest of these is Woodbine, with some 5000 acres, tilled by 500 colonists. Rosenhagen, bought in 1882, has 25,000 acres, occupied today by about 90 families. A community of a different type, mainly cooperative, is being developed by Mr. N. O. Nelson at LeClaire, Ill. (*q.v.*). There have been at various times attempts at communities of almost every description—vegetarian communities, spiritualistic communities, cooperative communities, etc. The large majority of them, however, have been too ephemeral to deserve separate notice, and their condition is too changeable to allow of exact statistics. (See COMMUNISM, etc.)

COMPENSATION.—Among the most difficult problems arising in social reform is the question how far, if at all, individuals should

be compensated by Government when the Government decides, for the public good, to take a business from them that they hitherto have conducted under the permission of the law. The problem, too, is very different in different forms of industry or traffic. If railroads are nationalized, what compensation, if any, should be given to the present stockholders is of necessity a different question from the question what compensation, if any, should be given to liquor manufacturers and sellers when their business is forbidden and their establishments closed. The Fourteenth Amendment to the United States Constitution says: "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws." Under the right of Eminent Domain (*q.v.*), according to the first amendment the Government can indeed take any property that it deems necessary for the public good, but only upon the payment to the former owners of a fair valuation of the property, the valuation to be made by an impartial tribunal. In different States the details of the laws determining the compensation vary, but in substantially all they demand that the value of the property is not to be measured by its present use, but to be estimated on the use to which it may be put, based on the uses of men of ordinary business foresight and prudence. The complications that may arise under such laws are naturally very great.

As applied to compensation to liquor manufacturers and sellers, when their business is forbidden by a State, early legal decisions did not favor compensation; but January 21, 1886, Judge Brewer decided, in the case of *Kansas ex rel. John Walruff, et al.*, that "national equity as well as constitutional guaranty forbids such a taking of private property for the public good without compensation." Other similar cases arising and being diversely decided by State courts December 5, 1887, the Supreme Court of the United States decided, by a vote of seven to one, that compensation was not necessary, on the ground that all property held in this country is held under the implied obligation that the owner's use shall not be injurious to the community. The decision said:

"The power which the States unquestionably have of prohibiting such uses by individuals of their property as will be prejudicial to the health, the morals, or the safety of the public is not, and—consistently with the existence and safety of organized society—cannot be burdened with the condition that the State must compensate such individual owners for pecuniary losses they sustain by reason of their not being permitted by a noxious use of their property to inflict injury upon the community. . . . It is true that when the defendants in these cases purchased or erected their breweries the laws of the State did not forbid the manufacture of intoxicating liquors. But the State did not thereby give any assurance or come under an obligation that its legislation upon that subject would remain unchanged."

In England there has been considerable popular agitation upon this subject. In 1888 Lord

Salisbury, then in office, introduced a local government bill, of which an important feature was a provision for recognizing a vested interest in existing liquor licenses by granting compensation to liquor sellers whose applications for renewals should be refused. It was claimed that the object of the bill was to reduce the number of licenses. Mr. Gladstone and the Liberals strongly opposed the bill, and it was, amid much excitement, after finding a dwindling majority in its favor, on separate readings, finally withdrawn.

The problem of compensation to the stockholders of railroads and other forms of business which cannot at all be considered "prejudicial to the health, morals, or safety" of the public, and which yet may be nationalized or monopolized, is obviously another matter. The Constitution evidently calls for compensation to the owners of such property at its full present and within reasonable limits, prospective market

Compensation for Sociologic Industries.

value. The fact that the value concerned may consist very largely of a franchise originally obtained from the State, perhaps on terms utterly unjust to the State, seems to make no legal difference. The franchise is owned to-day by the stockholders, however gained, and has to-day a certain value, however watered. Unless, therefore, illegal fraud can be proven, the owners of the property seem to be entitled by the Constitution to full compensation. The more conservative friends of nationalizing or municipalizing industries believe that the present owners should receive, irrespective of how the value of their property has been gained, full compensation for present and prospective values. They argue this both on the grounds of equity and of expediency. It is equitable, they say, because these people have invested in such enterprises under the guaranty of the Constitution, and that guaranty should be kept even if the Government did make a mistake in granting the franchise. It is expedient, they say, because, in a democratic country the socialization of industries cannot be effected unless the people vote it, and if compensation be not promised, it will enlist against the proposal the interests of wealthy, influential, and numerous stockholders. Even when there has been dishonesty in the obtaining of the franchise, the dishonesty has usually been on the part of the few managers and not of the general stockholders; so that to make the general stockholders in this case suffer would be doubly unjust and inexpedient. (For a fuller statement of this view, see a quotation from Professor Ely, in article NATIONAL MONOPOLIES.)

On the other hand, many radical reformers hold that to compensate the present owners of railroad and other similar stock at anything like its present face market and prospective value would be utterly unjust to a community that has already been too indulgent to the corporations, and would render nugatory many of the purposes for which socialization is proposed. At least one of the objects of the socialization of industry (see SOCIALISM) is to substitute

Views Opposing Compensation.

a cooperative for a capitalistic civilization. If, then, the face value of the present watered and inflated stock is to be given to the owners of a socialized industry, it will by no means lessen the amount of capital to be invested, and that amount will simply go in some way to perpetuate the capitalistic sum. Thinkers of this school, therefore, propose, as does the Fabian Society of England, to grant no *compensation*, but to grant relief to any of the poor stockholders who may be reduced to extremity by the socialization. This is defended ethically on the ground that the value of the stock of present railway and similar corporations has scarcely, in any case, been the result of real effort or sacrifice on the part of its holders. It has been gained, in many cases, by first obtaining from the Government, and often for nothing, large concessions of land or capital; second, this original sum has been very largely watered, sometimes 50 per cent. or more. (See WATERED STOCK.) What work has been done on the railroads has been done often by poorly paid employees; the amount of money put in by the stockholders themselves is often very little. Still other persons would grant some compensation, but only as much, perhaps, as would correspond to the money actually paid in, or, perhaps, to the amount for which the present plant could be today replaced. Constitutional difficulties would be met, by persons not believing in compensation, by proving what probably could be proved in almost all cases, that the corporation has in some way violated the terms of its franchise, and so cannot stand upon that.

Still another school of thought upon this point would get around the difficulty by recognizing it and having the government not buy up the railroads, etc., but build new roads, and by competition running out those managed by private corporations. Some would make this a way of employing the unemployed, of issuing non-interest-bearing bonds, etc.

Such are some of the diverse ways in which the problem is met to-day by different men. See RAILROADS; NATIONAL MONOPOLIES; SOCIALISM.)

COMPETITION (Lat., *com*, and *petere*, to seek together) is in social science the strife of the individual or of a group of individuals to gain the utmost possible profit, rent, or wage in free rivalry with other individuals or groups of individuals. It is defined in Palgrave's *Dictionary of Political Economy* as "the free action of individual self-interest." But this is not enough. The free action of individual self-interest may lead a man into cooperation or socialism, the opposites of competition. The distinctive characteristic of competition is in its being the free action of self-interest *in fair rivalry with some other individual or group of individuals*. One man cannot compete. He must compete with somebody. This is seen in the derivation of the word, from *com* and *petere*, to seek with.

Definition.

Competition, so conceived, is held by most to be to-day the supreme law of trade. As such it is defended by believers in present industrial methods, is bitterly condemned by socialist

reformers, while perhaps the majority of minds and almost all political economists to-day, seeing evils in unlimited competition, would modify its free play, but not supplant it by any other principle. Still another school of thought denies that we have free competition to-day, and declares that what is needed to save us from our present industrial ills is not less competition, but more competition. We must notice these four views:

I. The believers in competition usually assert first that it is the law of nature, and they sometimes add that it is "therefore the law of God." "Theorists and sentimentalists may talk as they will," say the believers in competition, "of abolishing the strife for self or the struggle for existence, the play of self-interest; but the fact remains that this principle always has existed in the world, always has ruled the world, has produced and exists most in the most progressive civilizations." "Progress," says Professor Flower (*Reply to an Address by the Trades Council*, New Castle,

September, 1889), "has been due to the opportunity of those individuals who are a little superior in some respects to their fellows, of asserting their superiority, and of continuing to live, and of promulgating as an inheritance that superiority." "To formulate this as the immutable law of progress since the beginnings of life has been," Mr. Benjamin Kidd tells us (*Social Evolution*, p. 34), "one of the principal results of the biological science of the century." "It is," says Professor Flower, "the message which pure and abstract biological research has sent to help us on with some of the commonest problems of human life" (*idem*). "It is," Mr. Kidd adds (*idem*, p. 37) "an inevitable law of life among the higher forms, that competition and selection must not only always accompany progress, but that they must prevail among every form of life which is not actually retrograding." Socialism, therefore, which aims "at the final suspension of that personal struggle for existence," cannot, according to Mr. Kidd, "in any case avoid progressive degeneration" (*idem*, p. 210). This is the main argument urged in a hundred forms by the believers in competition. Competition is the source of progress. We must, therefore, have competition in order to have progress. Theological writers sometimes add that this is the law of God.

But, secondly, competition is defended as working on the whole for the good of all classes. Most orthodox economists take this position. Professor Fawcett (*Political Economy*, book ii., chap. ii.), says of competition:

"The poverty of the poor is often attributed to it; but we shall have reason to show that it is no enemy to the working classes. Without it, their poverty would be rendered doubly severe; for it is an active spirit of competition which maintains the capital from which the wages of the laborers are paid. Competition befriends the working classes in other respects; it cheapens commodities, and ensures that the maximum of wages shall always be paid. Competition is not confined to one class; it may be as rife among buyers as among sellers, or among the employers as among the employed. Individuals who have goods to sell are anxious to realize as large profits as possible; but when there is competition, a trader cannot be paid more than what is termed a fair price for his goods, because if he attempts to obtain more than the ordinary price he will be undersold by other traders. When buyers compete with each other they are anxious to secure the greatest gains, or, in other words, to buy upon the best possible terms; and thus, when buyers are each intent on purchasing on the most favorable terms, a commodity is sure to realize what it is worth. It therefore follows that if, on the one hand, competition prevents a trader obtaining exceptionally high profits, on the other hand it ensures to him a fair price for his goods. Some, perhaps, may think it unfortunate that employers, stimulated by a desire to realize the largest gains, should seek to engage their laborers on the lowest possible terms. But such conduct upon the part of the employers inflicts no injury upon the laborers; for whenever there is activity of competition, an individual manufacturer or trader is as powerless to get laborers to work for him at less than the ordinary wages as

he would be to buy cotton at a cheaper rate than his fellow-manufacturers. The price of cotton is maintained because there are those who are anxious to purchase it; the rate of wages is also maintained by those who are anxious to purchase labor. Competition, consequently, exerts no tendency to reduce profits or wages; the tendency is rather one of equalization."

Another form of the same argument is that competition works for the good of all because it tends to make each one and each nation do what he can do best. Where each individual and each nation is striving in a free market, that individual and that nation that can do given work or produce a given commodity the best will win. We will thus have the survival of the fittest. But there is something which each man and each nation can do best. Therefore under free competition each man and each nation will do what he or it can do best, and all be benefited by the exchange.

Thirdly, believers in competition say nothing can be substituted for it. Palgrave's *Dictionary of Political Economy* says: "It is difficult even to imagine upon what other principle certain complicated transactions of modern trade and industry could be regulated."

"The difficulty of finding any adequate substitute for it (the motive of self-interest) is an almost invincible obstacle in the way of reconstructing society on any but its present individualistic basis" (Sidgwick). Jevons says (*Scientific Primer*, ch. vii.): "There is no way of deciding what is a fair day's wages" outside competition."

Lastly, the believers in competition defend it on the ground that it tends to make individuals self-reliant, independent, inventive, alert, quick to conceive, strong to execute, ready to dare. They point out that the most progressive nations are those where competition has had the greatest development.

II. Coming to the views of those who disbelieve in competition, they, in the first place, deny that competition and the struggle for existence is the *only* cause of progress. Says Charles Kingsley: "That self-interest is a law of human nature I know well; that it ought to be the root law of human society I deny, unless society is to sink down again into a Roman empire and a cage of wild beasts." "Competition," said F. D. Maurice, "is put forth as the law of the universe. This is a lie. The time is come to declare it a lie by word and deed."

That competition and the struggle for existence have entered into and do still enter into the progress of the world, no one denies; it is simply denied that it is the *only* way of making progress. Mr. Kidd's new *Social Evolution*, that lauds competition as "the immutable law of progress," is full of instances of progress in civilization made by the spirit of altruism and self-sacrifice. Even animals (like the beaver and the ant) progress by cooperation. Human society has progressed immeasurably by organization, by combination, by cooperation. It is not true that those States are the most progressive where competition is the least controlled. One chief function of the State is to limit competition, and when the State has reached the fullest development, as in Germany, England, and America, then civilization is the best. Biology, if it asserts that competition is the law of progress, has studied the lower forms of life more than the higher. It is almost more true that progress is proportional to man's escape from competition. Competition patterns after the brutes; cooperation patterns after the nobler instincts of humanity.

It is not, however, claimed by the disbelievers in competition that competition has no place in society. They simply argue for an evolution of competition. Competition does tend to the survival of those most fit to compete in the form of struggle in which the competition takes place. The primitive competition was purely physical. Men fought with bare hands, with clubs, or with spears, poisoned arrows, etc. It produced physical giants—Agamemnon, Hercules, Nimrod. "There were giants in those days." But gradually developing combination, law, order, the State, checked the competition of force and replaced it by a competition more intellectual. Did the race deteriorate? No; it simply developed a higher form of leaders, the Alexanders, Hannibals, Cæsars, Napoleons of society. To-day cooperation, combination, arbitration are replacing the competition of conquerors; competition is now industrial. It is developing leaders in that form of competition—"Napoleons of finance"—the Rothschilds, the Jay Goulds, Carnegies, Rockefellers, etc.

The Argument for Competition.

Develops Self-Reliance.

The Argument against Competition.

For the Good of All Classes.

Wages.

What the disbelievers in industrial competition ask is not that competition be wholly done away with, but simply that it be lifted up to a higher level. As the State now in the main prevents physical competition and protects the life of the weakest citizen, so they would have the State replace industrial competition by fraternal co-operation, and set men free to compete for honor in art, in science, in learning. This, they say, will produce not degeneration, but simply a higher type of men. They deny that industrial competition produces the best citizens. It exists nowhere so fiercely as in the United States. What is the result? Smart business men—the "smartest" in the world. But are these the highest type of men? Says Mr. Bryce, *American Commonwealth* (part iv., chap. 8i): "In no country does one find so many men of eminent capacity for business, shrewd, forcible, and daring, who are so uninteresting, so intellectually barren, outside the sphere of their business knowledge." Industrial competition produces a survival of the industrially smart, with little reference to their morals. Morals do help to a slight extent, but very slight. Says John Stuart Mill (*Fortnightly Review*, February, 1891): "If persons are helped in their worldly career by their virtues, so are they, and perhaps quite as often, by their vices; by servility and sycophancy, by hard-hearted and close-fisted selfishness, by the permitted lies and tricks of trade, by gambling speculations, not seldom by downright knavery. Energies and talents are of much more avail for success in life than virtues; but if one man

Competition Does not Produce the Best.

succeeds by employing energy and talent in something generally useful, another thrives by exercising the same qualities in out-generalizing and ruining a rival. It is as much as any moralist ventures to assert, that, other circumstances being given, honesty is the best policy, and that with parity of advantages an honest person has better chances than a rogue. Even this in many stations and circumstances of life is questionable; anything more than this is out of the question. It cannot be pretended that honesty, as a means of success, tells for as much as a difference of one single step on the social ladder. The connection between fortune and conduct is mainly this, that there is a degree of bad conduct, or rather of some kinds of bad conduct, which suffices to ruin any amount of good fortune; but the converse is not true; in the situation of most people no degree whatever of good conduct can be counted upon for raising them in the world, without the aid of fortunate accidents." As for what competition means to the working classes, says Louis Blanc, quoted by Mill in the above review:

"What is competition from the point of view of the workman? It is work put up to auction. A contractor wants a workman; three present themselves. 'How much for your work?' 'Half a crown; I have a wife and children.' 'Well; and how much for yours?' 'Two shillings; I have no children, but I have a wife.' 'Very well; and now how much for you?' 'One and eightpence are enough for me; I am single.' 'Then you shall have the work.' It is done; the bargain is struck. And what are the other two workmen to do? It is to be hoped they they will die quietly of hunger. But what if they take to thieving? Never fear; we have the police. To murder? We have got the hangman. As for the lucky one, his triumph is only temporary. Let a fourth workman make his appearance, strong enough to fast every other day, and his price will run down still lower; there will be a new outcast, a new recruit for the prison perhaps!

"Who is so blind as not to see that under the system of unlimited competition, the continual fall of wages is no exceptional circumstance, but a necessary and general fact? Has the population a limit which it cannot exceed? Is it possible for us to say to industry—industry given up to the accidents of individual egotism and fertile in ruin—can we say: 'Thus far shalt thou go, and no farther?' The population increases constantly; tell the poor mother to become sterile, and blaspheme the God who made her fruitful, for if you do not the lists will soon become too narrow for the combatants. A machine is invented; command it to be broken, and anathematize science, for if you do not, the 1000 workmen whom the new machine deprives of work will knock at the door of the neighboring workshop, and lower the wages of their companions. Thus systematic lowering of wages, ending in the driving out of a certain number of workmen, is the inevitable effect of unlimited competition. It is an industrial system by means of which the working classes are forced to exterminate one another."

If it be answered to this that such is not the fact;

that the working classes are not exterminating each other; that their condition has steadily risen through the century, and that the higher workmen of England and America, for example, do not fear the competition of China and India, it is to be said, "Yes, it is true that wages have risen; but is this the result of competition? Is it not because competition has to no little extent been limited in England and America by trade-union combination and factory legislation? Have not higher wages and shorter hours as a rule been forced from unwilling employer by organized labor and by legislation?" Until trade-unions were developed, and before there were efficient factory laws, when competition was unrestrained, wages were lower and conditions more terrible among working men than ever in English history. In the Middle Ages competition was, somewhat restrained by feudalism, and later by monopoly grants. Only in the latter part of the last century and first of this has competition been at all unlimited. Now of this period Thorold Rogers says (*Work and Wages*, p. 63): "I am convinced that at no period of English history for which authentic records exist was the condition of manual labor worse than it was from 1780-1820, the period in which manufacturers and merchants accumulated fortunes rapidly, and in which the rent of agricultural land was doubled."

Competition Modern.

The trouble with competition is that it puts even those manufacturers and employers who would be just at the mercy of those who are willing to do anything for gain. Says Professor Henry C. Adams, Ph.D. (*An Interpretation of the Social Movements of Our Time*, p. 11):

"Without legal regulation the struggle between men for commercial supremacy will surely force society to the level of the most immoral man who can sustain himself. The fittest to survive unregulated competition will be he who is morally the least fit to live. For purpose of illustration, suppose 10 manufacturers competing with each other to supply the market with cottons. Assume that nine of them, recognizing the rights of childhood, would gladly exclude from their employ all but adult labor. But the tenth man has no moral sense. His business is conducted solely with a view to large sales and a broad market. As child labor is actually cheaper than adult labor, he gives it a decided preference. What is the result? Since his goods come into competition with the goods of the other manufacturers, and since we who buy goods only ask respecting quality and price, the nine men whose moral instincts we commend will be obliged, if they would maintain themselves in business, to adopt the methods of the tenth man, whose immoral character we condemn. Thus the moral tone of business is brought down to the level of the worst man who can sustain himself in it."

As for the assertion that competition is necessary to produce independence, self-reliance, and individual exertion, the socialists who would supplant competition by cooperation do not argue for paternalism. Says a socialist writer: "Socialists are the opposite of paternalists. The socialists of Germany, for example, recently cast 1,500,000 votes against the so-called paternal socialism of the emperor. It is the wealthy Carnegies who would manage all business and give of their fortunes for the good of working men, who are the real paternalists of the day. Under democratic socialism the people would be the government, and work and manage for themselves. It would be the very 'open sesame' of character. Each man would then have to work. No drones here; no beggars living on the rich; no wealthy parasites fattening on the poor. If any man refused to work he would be left to starve, yet with no one to blame but himself, for every man would then have an opportunity to work." By simply doing a few hours of honest work each day for a few years of his life (each man choosing his own kind of work, the more disagreeable kinds of work being favored by less hours being demanded in them, so that men would be found to choose even them), every man would be sure of an honest competence. Does any man assert that this would not produce better and more independent character than we have to-day? No sycophancy of employee to employer; no dependence of professional men upon patrons; no servility of men of genius to men of money. There would still be competition, but for honor, not for money. Men would battle to see who should best serve the community, and so be honored by their fellow-men; they would not be forced to battle, as men are forced to battle to-day, however much they hate it, to undercut their rivals, or enter into "combines" against the public. Competition for honor would alone be appealed to, as that alone would mean success. Mrs. Annie Besant well

says, 'It is instructive to notice that these very forces may already be seen at work in every case in which subsistence is secured, and honor alone supplies the stimulus to action. The soldier's subsistence is certain, and does not depend on his exertions. At once he becomes susceptible to appeals to his patriotism, to his *esprit de corps*, to the honor of his flag; he will dare anything for glory, and value a bit of bronze, which is the "reward of valor," far more than a hundred times its weight in gold. Yet many of the private soldiers come from the worst of the population.'

"She continues, 'Or take the eagerness, self-denial, and strenuous effort thrown by young men into their mere games! The desire to be captain of the Oxford eleven, stroke of the Cambridge boat, victor in the foot-race or the leaping—in a word, the desire to excel—is strong enough to impel to exertions which often ruin physical health. Everywhere we see the multifarious desires of humanity assert themselves when once livelihood is secure.'

'The final argument of the opponents of competition to-day is, that competition cannot endure, that competition inevitably leads to combination, and that, therefore, the only question is not a choice between competition or combination, but between different kinds of combinations. Starting with competition, the few strong competitors find that it pays to combine. They therefore combine, and establish a private monopoly. The problem thus, for the

people, becomes not whether they shall compete or combine, but whether they shall submit to the rule of private combinations or democratically combine themselves through the State. It is a question of monopoly *vs.* monopolies, of democracy *vs.* the worst kind of an oligarchy, the rule of the plutocrat. The choice comes, they say, not between socialism or individualism, but between socialism and plutocracy.

These opponents of industrial competition thus assert that competition is not the only condition of progress; that cooperation in the State has been at least as much a source of progress; that industrial competition develops the smart trickster rather than the true man; that it treads down the weak and the altruistic, in the mad rush for gold; that it develops sycophancy and the rule of gold rather than independence; that socialism, municipalism, cooperation are proving to-day that industrial competition is *not* necessary to a progressive society. (See MUNICIPALISM; SOCIALISM; COOPERATION; BIRMINGHAM; GLASGOW; BERLIN.)

III. Many minds to-day and most professed political economists would not abolish industrial competition, but simply limit it. Says Professor Jevons, in the last chapter of his *The State in Relation to Labor*, summing up his whole argument: "The subject is one in

which we need above all things—discrimination. Restrictions on industry are not good nor bad *per se*, but according as they are imposed wisely and with good intentions, or foolishly, and with sinister intentions. *Prima facie*, indeed, restriction is bad, because Providence

is wiser than the legislator—that is to say, the action of the natural forces of evolution will ensure welfare better than the ill-considered laws of the prejudiced and unskillful legislator. But reason is a Divine gift, and where upon the grounds of clear experience interpreted by logical reasoning we can see our way to a definite improvement in some class of people without injuring others, we are under the obligation of endeavoring to promote that improvement. The greater part of the interference of trade societies is objectionable, because, though directed toward the welfare of a part, it is directed against the welfare of the rest of the community. All other industrial problems must be solved by similar careful estimation of the total utilitarian results.

"If such be a true view of the case, it is clear that there can be no royal road to legislation in such matters. We cannot expect to agree in utilitarian estimates, at least without much debate. We must agree to differ; and though we are bound to argue fearlessly, it should be with the consciousness that there is room for wide and *bona fide* difference of opinion. We must consent to advance cautiously, step by step, feeling our way, adopting no foregone conclusions, trusting no single science, expecting no infallible guide. We must neither maximize the functions of government at the beck of quasi-military officials, nor minimize them according to the theories of the very best philosophers. We must learn to judge each case upon its merits, in-

terpreting with painful care all experience which can be brought to bear upon the matter."

This is probably the view of most professional economists to-day, though as to Jevons's assertion that Providence works through competition, it may be questioned if the State is not quite as much a natural development under Providence as any fiercest competition.

IV. We must not forget the view of those who assert that we do not have competition to-day. They say that under various laws of protective private property in land, men are not free to compete. They trace most monopolies in America, for example, to a protective tariff, and the most radical among them assert that as long as the law recognizes private property in land, men cannot be really free to compete. Some would abolish all taxes, save on land values.

The total value of the land, which no individual has created, they would take by taxation for the community that has given land its value, and then, thus putting all men on a natural equality, they would let man be absolutely free to work, sell, or cooperate as he will. They argue that men, when natural opportunities are not monopolized, are so nearly equal in ability, that no man could take much advantage of his neighbor, but each would be led to do that which he could do best, and exchange the fruits of his activity in equality and in freedom. (For a complete statement of this view, see SINGLE TAX.) It is said, on the other hand, that men are not equal in ability; that even on free land the smart, the shrewd, the strong would soon lord it over the altruistic and the weak, and free competition lead to the tyranny of the shrewdest and smartest competitor.

COMSTOCK, ANTHONY, was born in New Canaan, Conn., March 7, 1844, and educated in the academies of New Canaan and New Britain. From 1863-65 he served in the Union army. Since March, 1873, he has been post-office inspector, and secretary and chief special agent of the New York Society for the Suppression of Vice since its organization in 1873. In 20 years the society has made 1795 arrests and seized and destroyed 44½ tons of obscene matter and 17 tons of gambling materials. He has written *Frauds Exposed* (1880); *Traps for the Young* (1883); *Gambling Outrages* (1887); *Morals versus Art* (1887). See ART.

COMTE, ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER, was born at Montpellier, France, January 19, 1798. He studied at the Polytechnic School in Paris, and early attracted attention by his speculations. He became acquainted with St. Simon (*q.v.*), and entered enthusiastically into his theories. In 1820 Comte was appointed to prepare an exposition of the *Politique Positive* of the St. Simonians. The work did not satisfy St. Simon, who deplored the absence of the "religious and sentimental aspects" of his system. In 1825, on the death of St. Simon, Comte broke off altogether from the school, and in after years was accustomed to speak slightly of his old master's abilities. In 1826 Comte was attacked by a cerebral disorder, brought on by "overwork and heart anxieties." He recovered, however, and in 1832 was appointed teacher of mathematics at the *École Polytechnique*, which posi-

The Individualistic View.

tion he held for 20 years, till he was forced to resign in 1852, on account of differences with his colleagues. He died at Paris, September 5, 1857.

Comte's works are: *Cours de Philosophie Positive* (6 vols., Par. 1830-42; freely translated into English and condensed by Harriet Martineau, 2 vols., 1853); *Traité Élémentaire de Géométrie Analytique* (1843); *Traité d'Astronomie Populaire* (1845); *Discours sur l'Ensemble du Positivisme* (1848); *Système de Politique Positive* (4 vols., 1851-54; Eng. trans., 1875, et seq., Longmans); and *Catéchisme Positiviste, ou Sommaire Exposition de la Religion Universelle* (1 vol., Par. 1852). In brief, Comte's central and governing doctrine is this:

The race (like the individual) necessarily passes through three intellectual stages—the theological, the metaphysical, and the positive. "The theological conception assumes the direct intervention of an intelligent agent, presiding over the universe, to whom is attributed the arbitrary distribution of each modification undergone by nature. The metaphysical conception searches for some entity to whose intervention the phenomena in question are to be ascribed. The positive conception disregards all causes and addresses itself solely to the study of phenomena as they present themselves to the senses" (Ward's *Dynamic Sociology*, vol. 1, p. 93). The theological conception, Comte tells us, ruled to the thirteenth century; the metaphysical, in western Europe, to the close of the eighteenth. To-day man asks, according to him, simply what are phenomena, without seeking for intelligent agent or intervening entity. Sociology under the first period, he argues, assumed God as the center of society; in the second period, it forgot God, yet found naught. It was critical, negative, destructive; its only positive tendencies were in wild, visionary and anarchistic schemes, like those of most of the French revolutionists. To-day, he says, sociology must be constructive, based not on assumption of God or man, but only on proved facts.

This leads us to Comte's great distinction as a sociologist, that he first gave sociology a place as a science. His merit is to have laid emphasis upon facts rather than upon theories; to have given us a plan of arranging facts, which, if not a good plan, at least teaches us to have some plan, to insist upon action and legislation based upon knowledge of facts.

Says Dr. Ingram of Comte (*History of Political Economy*, p. 196): "The negative movement which filled the eighteenth century had for its watchword on the economic side the liberation of industrial effort from both feudal survivals and governmental fetters. But in all the aspects of that movement, the economic as well as the rest, the process of demolition was historically only the necessary preliminary condition of a total renovation, toward which western Europe was energetically tending, tho with but an indistinct conception of its precise nature. . . . The critical philosophy which had wrought the disorganization could only repeat its formulas of absolute liberty, but was powerless for reconstruction. And hence there was seen throughout the West, after the French explosion, the remarkable spectacle of a continuous oscillation between the tendency to recur to outworn ideas and a vague impulse toward a new order in social thought and life, this impulse often taking an anarchical character.

"From this state of oscillation, which has given to our century its equivocal and transitional aspect, the only possible issue was in the foundation of a scientific social doctrine which should supply a basis for the gradual convergence of opinion on human questions. The foundation of such a doctrine is the immortal service for which the world is indebted to Auguste Comte.

"The leading features of sociology, as he conceived it, are the following: (1) it is essentially *one* science, in which all the elements of a social state are studied in their relations and mutual actions; (2) it includes a dynamical as well as a static theory of society; (3) it thus eliminates the absolute, substituting for an imagined fixity the conception of ordered change; (4) its principal method, tho others are not excluded, is that of historical comparison; (5) it is pervaded by moral ideas, by notions of social duty, as opposed to the individual rights which were derived as corol-

laries from the *jus natura*; and (6) in its spirit and practical consequences it tends to the realization of all the great ends which compose 'the popular cause;' yet (7) it aims at this through peaceful means, replacing revolution by evolution. The several characteristics we have enumerated are not independent; they may be shown to be vitally connected with each other."

In the fourth volume of the *Philosophie Positive* (1839), Comte marks out the broad division between social statics and social dynamics—the former studying the laws of social coexistence, the latter those of social development, together forming sociology, which to him is the master science, for in his remarkable ordering of science he shows how the different sciences, as they emerge into the clear light of positivism, take their proper place, all leading up to sociology as, so to speak, the architect who builds up the thought of society, using other sciences as materials. Yet is Comte essentially a dogmatist. He starts out with asserting that "the essential spontaneous sociability of the human species, in virtue of an instinctive penchant for a life in common, can in no way be henceforth contested." In the matter of the dynamics of sociology, Comte finds the great forces of life in the instinct for material self-preservation, in the battle of the attributes of humanity over those of animality, and in the restlessness of *ennui*. Of *laissez faire* Comte was no friend. He favored a State ruling all life, conducted by a scientific priesthood. Such were, in brief, the teachings of the world's first great sociologist.

Comte's sociologic weakness is that he himself knew little of sociologic facts. He discovers the ocean and tells us that we ought to know it, but not much of the ocean does he himself report.

CONCENTRATION OF WEALTH. See WEALTH.

CONCILIATION, COURTS OF.—For conciliation as applied to the settlement of industrial disputes, see ARBITRATION AND CONCILIATION; but the principle of the settlement of disputes by conciliation, as developed especially in the Norwegian courts of conciliation, is capable of a very general application.

The first establishment of tribunals of conciliation seems to have been in Denmark in 1795, and in Norway in 1797, but the germ of the idea was developed in the French Revolution and adopted in the system of civil justice created in March, 1790, by the National Assembly. According to this idea, proposed by Thouret, justices of the peace were to be elected by the people in each canton and to have the power of deciding without appeal cases not involving over 50 livres. They were, Louis Blanc tells us, to be considered as outside the judicial order, "on the threshold of the Temple of Justice to warn intending litigants away." Thouret, judging by the name chosen, got his suggestion from England; but the first real application of the plan was in Denmark. In France the plan did not survive the Revolution. In 1795 courts of conciliation were actually established in Denmark, and in 1797 in Norway. The preamble to the royal edict establishing them says:

"Inasmuch as it has come to our notice that peasants and other lowly good and true subjects in our dominions are incited to quarrel about trifling things by dishonest lawyers, who generally keep their clutches on their unsuspecting clients till they have robbed them of all their property, we have, etc." Then follows the establishment of the new institutions.

Few laws were ever more popular, and the plan has stood the test of time. Every city, every village of at least 20 families, and every parish constitutes a separate "district of conciliation." The court is made up of two men, chosen for three years, by the voters of the district. The

court meets weekly in the cities and monthly in the country. It is not public. Admissions or concessions made by any party cannot be used against him in court. But a party willing to settle before the commissioners can receive a certificate to that effect. Appearance is compulsory, and the court has power in all civil and private cases. The method of procedure is very simple. The plaintiff states his case in writing. A fee of 25 cents is charged for the summons, and 50 cents more if settlement is reached. These are the total costs. Evidence may be submitted. Personal attendance is necessary except in cases of extreme sickness, etc. Rules and forms play a small part. The personal element is mainly relied on. The judges are usually personally known. In Norway it is stated that 75 per cent. of the cases can be settled in these courts of conciliation. During the year 1888, 103,969 civil actions were begun in Norway. Of these, 2300 cases were dismissed by the courts of conciliation. Of the remaining 101,669, no less than 81,015, or 80 per cent., were conciliated; 7886 more were adjudicated by the courts of conciliation, thus settling nearly nine tenths of the whole number.

Some attempt has been made to introduce similar courts into the United States, but only in North Dakota, the most Norwegian State, has anything really been accomplished.

On March 10, 1893, the Governor of North Dakota affixed his signature to "an Act providing for the establishment of courts of conciliation, and prescribing the mode of procedure in the same."

This Act provides as follows:

"Sec. I. There shall be elected at the same time and in the same manner as the justices of the peace, in each town, incorporated village, and city, from the qualified voters thereof, four commissioners of conciliation, whose term of office shall be two years, and until their successors are duly elected and qualified.

"Sec. II. At the time of issuing the summons in any civil action begun before a justice of the peace, the justice shall issue a subpoena summoning two of the commissioners of conciliation elected for the town, village, or city where the action is brought, to appear before him at the time and place designated in the summons, which subpoena shall be served at least three days before the return-day, and in the same manner as a summons is required to be served in actions in the district court. If either party fails to appear at the time designated in the summons, judgment shall be entered against the party so failing to appear, as is now provided by statute. If both parties appear, they shall then go before the justice and the two commissioners summoned, as aforesaid, and state their differences, which statements, or so much thereof as is necessary to show the issue between the parties, shall be reduced to writing by the justice and entered on his docket, and shall constitute the pleadings in the case. The parties shall then introduce such evidence as they may think proper in the order and under the restrictions prescribed by the commissioner's and justice. It shall be discretionary with the justice and commissioners whether or not the witnesses shall be sworn before testifying.

"After hearing and considering all the evidence offered, it shall be the duty of the justice and commissioner, to the best of their abilities, to persuade the parties to agree to an amicable settlement of their differences on such terms as are just and equitable. If an agreement is reached, it shall be entered by the justice on his docket in the form of a judgment of the court of said justice; provided that no agreement shall be entered, unless it can be put in the form of a judgment now authorized by law to be entered by justices of the peace. At the hearing herein provided for, each party must appear in person, or by an agent duly authorized in writing to appear. No attorney shall be allowed in any way to appear or act in any proceeding for either of the parties or otherwise. If, at such hearing, the parties are not able to agree to an amicable settlement, the case shall be adjourned for trial for such time as the justice shall designate,

which shall not be less than one week, and the justice shall allow the parties such time as he may think proper in which to file amended pleadings. The action shall then proceed to trial and judgment as is now provided by law.

"Sec. III. The commissioners shall receive the same mileage and per diem as is now paid jurors. The fee of the commissioners, justice, and officer shall be included in the settlement, and paid by the party designated in the judgment. If a commissioner disobey the subpoena of the justice, he shall be proceeded against in the same manner as a juror who fails to appear when summoned.

"Sec. IV. No part of the proceedings had before the justice and commissioners shall be admitted as evidence or considered at the trial of the case, nor shall the commissioners who took part in the hearing be allowed to testify."

This is not much compared with the Norwegian system and yet a beginning. References: Two articles on *Courts of Conciliation*, by Nicolay Grevstad in *The Atlantic* for September, 1891, and November, 1893.

CONFISCATION. See COMPENSATION.

CONGREGATIONAL CHURCH AND SOCIAL REFORM, THE.—Democracy in religion, the fundamental principle and *raison d'être* of Congregationalism, has made it a reformatory force in modern life. In the stand for freedom of worship taken by a few churchmen within the Church of England in 1567 and thereafter, began the far-reaching movement that issued in ecclesiastical Separatism, Independence, Nonconformity and Congregationalism, and in the many reformatory tendencies toward social democracy necessarily involved therein. The first organization of this force was effected in Bridewell Prison by those incarcerated for holding religious services at a wedding in Plumbers' Hall, London, who provided for a continuance of the same during their term of imprisonment and thereafter. Under the leadership of Robert Browne, others became Separatists, at first only from "the world," but involving thereby the principle of their separation from the state church, and of the church from the state by establishing the ecclesiastical right of self-government and local autonomy. Thriving under the persecution which branded Nonconformity in religion as treason to the state, and punished it with death, the blood of their martyr ministers became the seed of the social revolution of the English people. Barrowe and Greenwood, in 1593, formulated this growing sentiment into a polity which, because it vested the only recognized ecclesiastical authority in the local congregation, came to be known as Congregational. The only chance for the survival and growth of this tender plant of liberty being in transplantation to more hospitable soil, the little village congregation of Scrooby "resolved to go into the Low Countries, where they heard was freedom of religion for all men."

Resident long enough in Holland to be deeply impressed with the civil and religious liberties, popular education, local self-government, and democratic tendencies of the Dutch, who were then the freest and most progressive people in Europe, the Pilgrim Fathers again tried the experiment of planting the free life on English soil in the new world.

With their landing at Plymouth, the process of settling the New England by church congregations began. "In pursuit of religious freedom they established civil liberty. Meaning

only to found a church, they gave birth to a nation; and in settling a town in Connecticut, they commenced an empire."

The reformatory force of the Congregationalists both in England and America has been most profoundly and practically felt in the political life of both countries.

The ecclesiastical polity of these locally autonomous congregations of worshippers became the formative principle and framework of their politics when they formed themselves into the colonial bodies politic. November 21, 1620, when, in accordance with the farewell letter of instruction from their pastor, John Robinson, the pilgrims signed their compact in the cabin of the *Mayflower*, is declared by Bancroft to be "the birth-hour of popular constitutional liberty." But constitutional government in America had another, the Congregational source. It is to be traced through the independence of the town, as that political unit was first constituted in Connecticut. There the federation of three independent self-governing towns constituted the commonwealth. These three original towns were the Congregational churches of Hartford, Windsor, and Wethersfield. Their compact, made with each other in Hartford, January 14, 1638, more than that of the *Mayflower*, is to be regarded as "the first written constitution, in the modern sense of the term, as a permanent limitation of governmental power known in history." This first constitutional government was forged out in fact and formulated in statute by men who, on May 31, 1638, had heard Thomas Hooker, the pilgrim pastor of these migratory towns, preach from Deut. 1:13 these political doctrines of Christianity:

"Doctrine I. That the choice of public magistrates belongs unto the people by God's own allowance.

"II. The privilege of election, which belongs to the people, therefore must not be exercised according to their humors, but according to the blessed will and law of God.

"III. They who have power to appoint officers and magistrates, it is in their power also to set the bounds and limitations of the power and place unto which they call them.

"Reasons: 1. Because the foundation of authority is laid firstly in the free consent of the people.

"2. Because, by a free choice, the hearts of the people will be more inclined to the love of the persons chosen and more ready to yield obedience.

"Here is the first practical assertion of the right of the people," writes Alexander Johnston in his volume on Connecticut, "not only to choose, but to limit the powers of their rulers," an assertion which lies at the root of the American system.

"It is on the banks of the Connecticut, under the mighty preaching of Thomas Hooker, and in the Constitution to which he gave life, if not form, that we draw the first breath of that atmosphere which is now so familiar to us. The birthplace of American democracy is Hartford." This historian also attributes that union of the democratic and federative ideas, and the peculiar constitution of our Congress in the different basis of the Senate and the House of Representatives, to Connecticut's long maintenance of a federative democracy, which, as we have seen, grew out of her three Congregational townships.

"The civil codes of the colonies at first consisted of the 'Judicials' and the 'Body of Liberties,' published by their early ministers, and long thereafter were proposed by their successors.

"Altho more tolerant than the Puritan colonists, and more liberal in refusing to restrict the suffrage to the Church membership, the Pilgrim body politic was virtually the civic assembly of the congregation, and the congregation was the religious society of citizens. Of this reciprocal relation of their independent church and state the 'ecclesiastical societies' remain as the survivals of the days when the legal voters of the

town provided the financial support of the church and were recognized as having a right to act conjointly with its members in control of its temporal affairs, and even in the selection of its minister. Taxation carried with it the right to representation.

"The apprehension of Episcopacy, which was being forced upon the colonists," contributed as much as any other cause," so John Adams wrote, "to arouse the common people to close thinking on the constitutional authority of Parliament over the colonies." The Declaration and War of Independence were the consequences of this thinking. How much the Congregational pulpit contributed toward both is in evidence. Resistance to encroachments upon civil liberties was urged by the old war cry of religious liberty. Protests against the Stamp Act and other English aggressions rang out on Sabbaths and fast days. Church buildings were seized and occupied by British soldiers to prevent their use as revolutionary centers. The constructive influence of the churches in building the colonies into the nation is illustrated in pastor Mayhew's letter to James Otis, in which he wrote: "You have heard of the communion of the churches; while I was thinking of this in my bed, the great use and importance of a communion of the colonies appeared in a strong light."

The anti-slavery reform was largely prompted and promoted by the Puritan and pilgrim spirit embodied in Congregational churches. As early as 1830 the "Arnistad Committee" was formed in New York for the legal defense and religious instruction of a cargo of negroes captured on the slave schooner *Arnistad*. They were declared free by the United States Supreme Court, taught at Farmington, Conn., and sent back to Africa. This and other similar organizations united to constitute the American Missionary Association in 1846, which from the beginning has deserved recognition as the foremost expert agency for raising the abject, restoring the subject, and reclaiming the alien elements of American population. At first this association scattered its work in Africa, Jamaica, Hawaii, Siam, and Egypt, while at home it espoused the cause of the Indians, the fugitive negro slaves, and the struggling and persecuted anti-slavery churches East and West.

In 1836 Congregationalists, upon securing control of the recently founded Oberlin College, made it the first educational institution which accepted the basis of Christian equality and opened its full privileges to all alike, irrespective of color or previous condition of servitude. It founded its theological department to receive the students from another seminary which had proscribed the discussion of slavery. Subsequently it was the first college to open its doors to women upon the same terms as to men.

In 1851 Mrs. Harriet Beecher Stowe honored her distinguished Congregational lineage by publishing *Uncle Tom's Cabin*, which defeated the execution of the Fugitive Slave Law and made emancipation possible, as did her brother, Henry Ward Beecher, later, by his overpowering advocacy of the abolition of slavery and the cause of the Union. The struggle for the freedom of the soil of the Western States called upon the children of the Pilgrims to become the Pilgrim Fathers of the New England colonies in Western territory, which restricted slavery to the South and marked the beginning of the end of it. Entering the Southern States with the Union armies, the American Missionary Association began the work of educating to self-help and citizenship the millions of slaves whose freedom it had helped secure.

Its schools, colleges, universities, educational funds, industrial, technical, and professional training, and its churches are the greatest forces at work in the nation for civilizing, Christianizing, and unifying the negro, Indian, Chinese, and mountain white elements of its population.

The reformatory movements in the American

body politic cannot be accounted for without recognizing the large part which Congregational educational institutions have borne in them all. Harvard, Yale, Mount Holyoke, and the New England colleges; Oberlin, Marietta, Beloit, Whitman, and the Western colleges have woven their names into the social and political history of the country. The acquisition of the rich and vast Northwest Territory of Oregon and Washington was due to Marcus Whitman, the pioneer missionary and educator, whose famous ride to the nation's capital saved the "great American desert" to the sisterhood of States. One in four of the entire male membership of churches in the interior and trans-Mississippi States was enrolled in the Union army during the Civil War. To reformatory literature the churches and schools of this order have contributed names than which none are more illustrious. Of the periodicals which have formed and led public opinion in these directions, such as the *Independent, Christian Union, Youth's Companion*, and others, many owe their origin and success to the aggressive spirits, born of these churches, who founded and conducted them.

In the adjustment of church life and work to the changed social conditions in city centers and large towns, the Congregationalists have been foremost. The so-called "institutional" churches, which by corporate effort and organized agencies seek to Christianize conditions of common life, have been from the first and still are found in the Congregational fellowship. The contemporary sociological movement in life, literature, and education has found no quicker and more practical response than in Congregational theological seminaries. While Harvard University was the first to offer social ethics as an elective course to its divinity students in 1880, Andover introduced the same in 1887; Hartford prescribed sociology as necessary to graduation in 1880; Chicago established an entire department exclusively devoted to sociological training in 1890, and Yale a distinct professorship of social ethics in 1894. In Iowa College, likewise, a department of Applied Christianity was founded. In connection with three of these seminaries social settlements have been successfully inaugurated—the Andover House, now the South End, in Boston, Chicago Commons, and the Hartford Settlement. Among the foremost specialists in sociology and social economics a notably large proportion are Congregational professors and ministers. While it cannot be said of any class of the American churches that they are to American social reform movements what Mr. Gladstone called the Nonconformist churches of Great Britain—*viz.*, "The backbone of the Liberal Party"—yet the Congregational churches of America, by virtue of their polity, principles, and history, have a supreme opportunity to exemplify and make more largely possible a Christian social democracy. What these churches have always in principle and often in practice stood for in America they have planted in many lands and nations by that splendid world movement of Christian civilization in which their American Board of Foreign Missions has led, and whereby the kingdom of God is coming to earth.

GRAHAM TAYLOR.

CONGRESS.—In separate articles we treat of the *House of Representatives* and the *Senate*, considering under this article only the history of the development of Congress as a portion of the political system of the United States, and those characteristics of Congress which belong to both the House and the Senate. Congress as it now exists is the result of a long evolution.

The first union that was formed between the American colonies was as early as 1643. A union was formed to resist the Indians between the colonies of the Massachusetts Bay, Plymouth, Connecticut, and New Haven, under the name of "The United Colonies of New England." A more important step to union was in 1754, when, at the request of the "lords commissioners for trade," commissioners from seven of the colonies—Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, Pennsylvania, and Maryland—met in Albany and held prolonged sessions. The object of this convention was to form a treaty with some of the Indian tribes, and to consider the best means for defending America against France. But the commissioners carried their views much farther than had been intended by the Government. A plan of union was proposed by Dr. Franklin, who was a member of the convention, providing for a confederation of all the colonies, with a council to be chosen triennially, and a president to be appointed by the crown. The president and council were to have power to regulate all affairs with the Indians, to control settlements on lands which should be purchased from the Indians, to govern such settlements, to raise soldiers, build forts, and equip vessels for guarding the coast and protecting the trade. They were to have power to make laws for the execution of these purposes, and to levy duties and taxes as they might think proper. The president was to have the veto power on all laws and acts of the council, and it was his duty to see that the laws were properly executed. The plan never went into operation, but was important in preparing the way for what followed, when in 1765, on a proposition made by Massachusetts, a congress met in New York to consider the Stamp Act. Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, and South Carolina elected commissioners. Virginia, North Carolina, and Georgia were not represented, the governors of these colonies having refused to call the assemblies together to appoint delegates. New Hampshire thought it prudent not to send delegates, although she approved the plan.

This was the first general meeting of the colonies for the purpose of considering their relations to the mother country. As a result, the Stamp Act was repealed, but the British ministers imposed new duties quite as obnoxious. The colonies determined to form a closer union, and sent delegates to Philadelphia with the general authority "to meet and consult together for the common welfare." This was the first Continental Congress. It was suggested by Massachusetts. On September 5, 1774, delegates from 12 of the 13 colonies assembled at Philadelphia. Georgia, the youngest colony, alone was unrepresented. Among the members were John Adams and Samuel Adams, of Massachusetts, Roger Sherman, of Connecticut, John Jay, of New York, George Washington, Peyton Randolph, Richard Henry Lee, and Patrick Henry, of Virginia. Randolph was chosen president, and the congress proceeded to business.

The first resolution adopted was one which subsequently proved of great importance. It provided as follows: "That in determining questions in this congress, each colony or province shall have one vote." This rule of equal State suffrage remained in force through the entire history of the second Continental Congress, and down to the adoption of the Constitution in 1789.

The session was short, and the business quickly dispatched. The Congress adopted an address to the king, one to the people of Great Britain, another to the inhabitants of the several colonies, and another to the inhabitants of Quebec. It was the confident belief of the majority of the members of this Congress, that the measures which they had adopted would produce a redress of their grievances. They adjourned after recommending that another Congress should convene on May 10 of the next year, provided that a redress of grievances was not previously obtained.

Origin of
Congress.

The breach, however, between England and the colonies became wider. Consequently, in accordance with the recommendation of the first Continental Congress, delegates were appointed by the several colonies, who met in Philadelphia on May 10, 1775. This body is known as the second Continental Congress. It became the national government of the people, and continued its sessions for 14 years.

The delegates to this Congress were chosen in some instances by the colonial legislatures, and in other cases by conventions of the people. Their object was not to establish a new government, and they had little thought of independence. Before they had assembled, however, General Gage, at Boston, had commenced open hostilities. Massachusetts sent a letter to Congress giving an account of the battles of Lexington and Concord, and requesting the advice and assistance of the Congress. The journal of Congress shows that in this letter was the following suggestion: "With the greatest deference we beg to suggest that a powerful army on the side of America is considered by us as the only means left to stem the rapid progress of a tyrannical ministry." The Congress at once appreciated the urgency of the case, and felt obliged to take measures to put the country in a state of defense, and so practically assume control over the military operations of the colonies. They organized an army, and appointed a commander-in-chief. They created a continental currency by issuing bills of credit. They established a treasury department and a post-office department, and from time to time adopted regulations concerning commerce; in fact, they drifted, apparently without design, into the exercise of sovereign powers. With the story of the Declaration of the Independence of the United States accomplished by this Congress we are not here concerned, but rather with the development of its powers.

On July 21, 1775, Dr. Franklin submitted to the assembly of delegates a plan entitled "Articles of Confederation and Perpetual Union of the Colonies." This appears to have been the basis of a plan reported to Congress from a committee July 12, 1776, which is in the handwriting of Mr. John Dickinson, of Delaware, to which as amended the Congress agreed on November 15, 1777, and which they recommended for adoption to the several States. But the ratification by all the States was not completed till March 1, 1781, near the close of the war, when Maryland was the last of the States to give its consent. These articles formed the compact of confederation, and settled the powers of that Congress, which continued, very feebly, the Federal Government until the adoption of the Constitution of 1787.

It had but the most meager power. It was an executive without power to execute. It was a single House, composed of delegates from States, each of which expressly retained "its sovereignty, freedom, and independence." Each had the right at any time to recall and replace its delegates; and even their compensation was paid by the States sending them, so that no bond should hold them to the common government. Voting was by States. The separate States retained their sovereignty, refused at will their quota of contributions for national debts and national expenses, managed foreign and interstate commerce to suit their local interests, and made partial compacts with neighboring States in a manner which produced a general confusion bordering upon anarchy. But more union was necessary. In his *The Critical Period of American History*, Professor Fiske shows how the country was "drifting toward anarchy" (chap. iv.). The difficulty was met by the Constitution (*q.v.*) of 1787, the present Constitution of the United States. According to this, all legislative powers granted by the Constitution of the United States are vested in Congress, which consists of the Senate and the House of Representatives. The powers of Congress are enumerated in Article 1, Section 8, of the Constitution, and all powers not granted to Congress, or prohibited to the States, are reserved to the States or to the people; but the power of Congress is absolute within the scope of its authority. The Senate is composed of two members from every State, regardless of size or population; the members of the House are apportioned on the basis of population. Thus, while in the House the influence of the people is felt directly, according to their numbers, the Senate provides the means of defending the smaller States from the possible encroachments of the larger; and to assure the safety of the smaller States, the Constitution, Article 5, provides that "no State without its consent shall be deprived of its equal suffrage in the Senate." Bills that have passed

both Houses are sent to the President, who may either sign or veto them, or do neither, in which case the bill becomes a law after 10 days unless Congress has previously adjourned. (See VETO.) The veto of the President is the only check upon the power of Congress to legislate within the scope of its authority. Legislation exceeding the constitutional power of Congress will be declared unconstitutional by the Supreme Court, if that body is appealed to by either party to any controversy arising in an attempt to enforce such laws. Each House is, by the Constitution, "the judge of the elections, returns, and qualifications of its own members."

Each Congress must have at least two sessions. A new Congress comes into existence on March 4 in each odd year. The first regular session begins on the first Monday of December following. This session may hold, if the two Houses choose, through the entire year, or they may adjourn at any time during the year. Their second regular session begins on the first Monday of December following, and that session must close by March 4 following, when the new Congress comes into existence. The members of both Houses receive a salary from the Federal Government.

Congress has, from time to time, increased the compensation of its members from \$6 a day in the House, and \$7 a day in the Senate, until, by a law passed in 1874, the compensation of each Senator was fixed at \$5000 per annum, and the salary of each Representative at \$5000. The pay of the Speaker of the House and of the Vice-President, or, if there is none, the President of the Senate *pro tempore*, is \$8000 per annum. All these salaries are besides mileage and many other perquisites.

No Senator or Representative can hold any office under the United States during his membership. This prevents cabinet officers from being members of Congress.

"All bills for raising revenue originate in the House of Representatives; but the Senate may propose or concur with amendments, as on other bills."

Every bill which shall have passed the House of Representatives and the Senate must, before it becomes a law, be presented to the President of the United States; if he approve he signs it, but if not he returns it, with his objections, to that House in which it originated, who enter their objections at large on their journal, and proceed to reconsider it. If after such reconsideration two thirds of that House agree to pass the bill, it is sent, together with the objections, to the other House, and if approved by two thirds of that House, it becomes a law. If any bill is not returned by the President within 10 days (Sundays excepted) after it has been presented to him, it becomes a law, unless the Congress by their adjournment prevent its return, in which case it does not.

Coming now to the important subject of how this system works, we notice, first, the general characteristic that Congress works mainly by committees. With 357 members of the House and 90 Senators (the present number) it is obvious that all legislation cannot be put into shape by Congress as a whole. If there was no division of labor, little legislation could be enacted. It does not follow, however, that the present system is the best for dividing the work.

In England, Parliament is divided into two well-defined parties, the one supporting, the other opposing the ministry in power. Each party has its regular leaders or whips, and these leaders plan the legislation, their followers usually supporting them as armies follow a general. Between these two parties legislation is whipped into being. Only to a comparatively small extent are committees entrusted with preparing or discussing bills. In Congress, however, Committees, while there are the two great parties and party caucuses, committees are relied upon to outline all legislation and report them to Congress for final action. This in itself seems harmless and wise; but as at present conducted the system is of very great evil. Why this is so can in a moment be seen.

Powers of Congress.

The powers of Congress are enumerated in Article 1, Section 8, of the Constitution, and all powers not granted to Congress, or prohibited to the States, are reserved to the States or to the people; but the power of Congress is absolute within the scope of its authority. The Senate is composed of two members from every State, regardless of size or population; the members of the House are apportioned on the basis of population. Thus, while in the House the influence of the people is felt directly, according to their numbers, the Senate provides the means of defending the smaller States from the possible encroachments of the larger; and to assure the safety of the smaller States, the Constitution, Article 5, provides that "no State without its consent shall be deprived of its equal suffrage in the Senate." Bills that have passed

The number of bills before each Congress is large, reaching into the thousands; only the few most important can be adequately discussed by Congress as a whole. All others, if they are favorably reported by the committees to which they are referred, can be and usually are passed with little or no discussion. It follows that the fate of most bills depends not upon Congress as a whole, but upon the small committees to which they are referred. The committees usually sit in secret. They ordinarily give a public hearing to the friends and opponents of a measure, but the final voting of the committee is usually in secret. This gives the utmost opportunity for underhand influence and corruption. Small changes can be made, bills can be defeated or wholly altered at the last moment and then rushed through Congress. Especially is this the case with personal bills and special legislation. The fate of a bill thus often depends on the make-up of the committee. Now the appointing of the committees is made for the House, by the speaker, which gives him enormous and sometimes dictatorial power. In the Senate, the committees are voted on by the Senate; but in both cases they are almost invariably appointed in consultation with the leaders of the party in power and for strictly party purposes. The Senate has toward 50 standing committees; the House over 50. Besides these, special committees are continually being appointed. The most important standing committees are the following: Ways and means; appropriations; elections; banking and currency; accounts; rivers and harbors; judiciary (including changes in private law, as well as in courts of justice); railways and canals; foreign affairs; naval affairs; military affairs; public lands; agriculture; claims; and the several committees on the expenditures of the various departments of the administration (war, navy, etc.).

Each congressman is usually put upon some committee (a committee usually consisting of from 3 to 11 members); but the more important committees and the chairmanship of all committees are usually given to old party leaders who often hold the same committee ship year after year, and are always (in the case of standing committees) appointed for the two years' session of Congress.

It is obvious from these conditions what a grip party machinery has upon Congress, and how helpless against the machine is the individual congressman. Especially in the last days of Congress, when bills are rushed through, enormous influence is brought to bear upon any obstreperous member who dares to resist the party's will. Corrupt special legislation can thus be easily gotten through, provided that the party leaders acquiesce. This gives enormous power to lobbyists, who know what ropes to pull. A bill can be defeated or rendered successful by inducing the leaders to refer it to the right committee. In the committee the purchase or influencing of one or two votes will usually decide legislation. Considering the enormous financial interests involved in most congressional legislation, the wonder, perhaps, is, not at the corruption, but at the lack of corruption in Congress.

The system, however, is more effective in

stopping legislation than in enacting it. It is easier to stop a bill than to pass it. Most bills are choked in committees. Almost any bill can be conveniently pigeon-holed and not reported. Hence the defeat of most reform legislation in which the great parties are not immediately interested. Almost all bills are, as a matter of course, passed to a first and second reading and then referred to a committee, where it is said that over nine tenths of all bills stop. Occasionally a committee is compelled to report a bill, but usually not. When reported, it is rarely stated how large a majority or who of the committee favored or rejected the bill. The parties thus responsible for the adoption or rejection of a measure are often unknown. The whole system may be considered one of secret legislation.

The system, too, enables the administration to exert a strong but unseen influence on Congress. In the English Parliament the Cabinet appears in Parliament to propose and defend its measures. In Congress the Cabinet does not openly appear. But it can appear before and influence the committees, and yet this most important connection between the administration and Congress is wholly secret.

This committee system is the most important characteristic of congressional working, but others are of only less moment. Congress is rendered largely inefficient for wise patriotic legislation by the fact that since all senators and representatives must, when elected, be inhabitants of the State or district they represent, each member is all but expected to speak and vote, not for the good of the country as a whole, but of his particular section. Debates, therefore, become sectional rather than of real statesmanship. Again, the above fact often keeps out of Congress the best men. If a leading Republican happens to reside in a Democratic State, or *vice versa*, he has little or no chance of election to Congress. Any congressman who rises above sectional feeling and for the good of the country opposes the interests of his section can be retired, and no other section of the country can elect him. Machine politics, rather than fitness, elect congressmen. Terms of office, too, in Congress, especially for Representatives, being short, and the intricacies of politics often preventing re-nomination, few congressmen have power to accomplish much. Before they have well learned the ropes their term of office has expired. The result is that few congressmen have a chance to develop statesmanship. This is, of course, more true in the House than in the Senate. The House is usually a confused mass of new men whom the country does not know, managed by a Speaker who becomes an autocrat, ruling through committees which can alone be influenced by trained lobbyists who know the ropes.

In the Senate, men have more training and are better known; but it is a notorious fact that the best men of the country are not in the Senate, and the difference between the Senate today and in former times can be seen by comparing the names of Senators early in the century with those now in office. Yet degenerate as is

Other Characteristics.

Lack of Statesmanship.

the Senate, it is far more efficient than the House, and it is to this body that the country has often had to look to save it from the worst legislation or from the aggressions of the executive.

Congressmen notoriously to-day do not represent the people, but special interests and great moneyed corporations. This may be the result, not of any particular fault in the Constitution, but of the prevailing plutocracy, yet the fact remains. The Congress is almost the only great national legislative body owned wholly by the well-to-do. In the legislative bodies of Germany, France, Italy, Switzerland, and Belgium there is a large and growing number of socialists representing the toiling classes. In Parliament, even after the Con-

Composition servative victories of the last election, there are 13 labor men. In

Congress there is not one. In the Senate of the Fifty-fourth Congress, 1895-97, there were about 88 members (not including the senators from Utah). Of these 57 were lawyers, 2 were termed capitalists, 1 manufacturer, 2 merchants, 2 railroad presidents, 2 miners, 1 brewer, 1 steamship manager, 1 railroad and coal operator, 1 car builder, 2 bankers. The remaining 15 members out of the 88 were 3 journalists, 4 public officials, 3 farmers, 1 literary man, 1 physician, 1 clergyman, 1 planter, 1 stock grower. In the House, out of 356 members, 228 were lawyers, 14 bankers, 15 manufacturers, 12 merchants, 4 real estate dealers, 2 contractors, 2 capitalists. Of the remaining 79, 27 were farmers, 5 journalists, 5 public officials, 4 planters, 5 physicians, 8 editors, and the rest scattering. A Congress thus constituted becomes almost inevitably the tool of interested corporations and dominated by corporation attorneys.

The two Englishmen who most recently have studied American political developments—one favorably, the other unfavorably—have come to the following conclusion as to Congress: Mr. Lecky, in his *Democracy and Liberty*, says that Mr. Bryce, in his *American Commonwealth*, tho trying to minimize the gravity and significance of the situation, has to admit that several prominent men of both parties in the Senate have been suspected of complicity in railroad jobs and revenue reforms; that all legislation affecting corporations and manufactures is systematically managed, or at least influenced by corruption; that about 5 per cent. of both houses of Congress take direct money bribes; that from 17 to 20 per cent. are pretty certainly open to corruption, and a much larger number suspected to be dishonest. (For further evidence on this point, see PLUTOCRACY; LOBBIES, etc.)

Corruption. These, however, tho the main evils in Congress, are not the only ones. Another characteristic of Congress is that there is no connection between money-raising and money-spending. Bills for revenue originate in the House and are referred to one committee—the Committee of Ways and Means. The bills for spending money are referred to the Committee on Appropriations, the Committee on Rivers and Harbors, and various committees on departments, like the army, navy, pensions, etc. The whole committee system breaks up all unity in Congress.

tees on departments, like the army, navy, pensions, etc. The whole committee system breaks up all unity in Congress.

Another important characteristic of Congress is that when the Senate and House disagree on the details of a bill, as continually happens, a conference committee is appointed, and this committee, meeting in secret, shapes the final and important details of many bills to which the Senate and House are almost compelled to assent on pain of failing to pass any bill at all.

Such are some of the evils of the present workings of Congress.

It is not to be denied that there is a more favorable side. (For a review of this, see CONSTITUTION.) Perhaps the wonder is not that Congress is so bad, but that it is so good.

How to make it better is a question much discussed. The problem, as far as discussion goes, seems to be to increase the opportunity for discussion in the House and to check discussion in the Senate. The House, especially under the rules brought in by Mr. Reed, is far too much under the thumb of the Speaker. The Senate, under the claim of senatorial courtesy, talks too much and acts too little.

Reforms Proposed.

But these reforms do not go to the bottom of the matter. Probably the reforms most needed in Congress are reforms out of Congress, that will send better men there and weaken the influence of the corporations; but passing this by, the more immediate reforms proposed are to change the requirement that congressmen inhabit the districts they represent and to lengthen the term of office. These proposals, however, are by no means assented to by all. A large body of reformers believe that relief can be obtained only by the principles of the Referendum and Initiation (*q.v.*), which will largely take from Congress its power of legislation and vest it in the people. Others believe that Congress should adopt the English system of a ministry represented in Congress, defending its measures and opposed by an organized opposition. Concerning present evils and the English system, Mr. Gamaliel Bradford, in the *Annals of the American Academy of Political and Social Science* (November, 1893) says:

"When the next Congress assembles there will be 356 members—and the reasoning is just as good for the Senate with its 88 members—all precisely equal. Probably not more than one half of the members have ever been there before, and very few for more than one term. . . . They can do nothing at all till they have elected a speaker. That speaker makes up, at his absolute discretion, the standing committees, some 50 in number, to whom everything is referred."

What Mr. Bradford proposes in place of this legislation by irresponsible committees and lordly senators is to make of the members of the Cabinet leaders, with a voice in Congress, such as the members of the English Cabinet have around, whom independent members as well as parties can rally, and against whose lead an opposition can be openly formed, the people being left free to decide between the two policies. Woodrow Wilson, in his *Congressional Government*, advocates the abolition of standing committees, and recom-

Methods of Reform.

mends that the Cabinet should have seats in Congress and be advisers of both President and Congress. Albert Stickney, in his *A True Republic*, argues that we cannot have a true republic until our Constitution be revised. He proposes the abolition of the term system, the giving to Congress all the legislative and removing power, but no appointing power, which he would place wholly in the hands of the President and department heads. Radicals in America usually look for reform by proposing to give to Congress only the shaping of bills, as stated above.

Parties as constituted at the beginning of each Congress are given. These figures were liable to change by contests for seats, etc.

* Liberal Republicans.
 † Greenbackers.
 ‡ David Davis, Independent, of Illinois.
 § Two Virginia Senators were Readjusters, and voted with the Republicans.

¶ People's party, except that in the House of Representatives of the Fifty-fourth Congress one member is classed as Silver party.

‡ Three Senate seats were vacant (and continued so) and two Representative seats were unfilled (Rhode Island had not yet effected a choice) when the session began. Rhode Island subsequently elected two Republicans.

CONRAD, JOHANNES C.—Professor Conrad was born in West Prussia in 1839. He studied at Berlin and Jena. In 1868 he became *Docent* and then professor of political economy at Jena, but in 1870 was called to Halle. In 1872 he commenced assisting his father-in-law, Professor Hildebrand, in the editorship of the *Jahrbücher für Nationalökonomie und Statistik*, and in 1878 became sole editor. He is in economics identified with the historical school. Among his writings are: *Die Nationalökonomie der Gegenwart und Zukunft* (1848); *Liebig's Ansicht v. der landwirtschaftl. Bodenerschöpfung* (1864). Since 1889 he has been chief editor of the important *Handwörterbuch der Staatswissenschaften*.

CONSENT, AGE OF. See AGE OF CONSENT.

CONSERVATIVE PARTY AND SOCIAL REFORM, THE (English).—The use of the term *Conservative*, as applied to an English political party, dates from about 1831, when the discussions over Catholic emancipation and parliamentary reform were bringing up new issues and teaching the more progressive Tories to call themselves *Conservatives*, as the more progressive Whigs were learning to call themselves *Liberals*. The leaders of this movement called themselves *Conservatives*, because, altho they admitted the necessity of reform, they desired to conserve by every constitutional means the existing institutions of the country, both ecclesiastical and civil, and to oppose such meas-

ures and changes as they believed would impair these institutions. Mr. Wilson Crocker is credited with the first use of the word, when he spoke in the *Quarterly Review* of being conscientiously attached "to what is called the Tory, but which might with more propriety be called the Conservative Party." Sir Robert Peel was at this time the leader of the party. Disraeli was just coming into notice. The party early took an active part in social reform. If it is, on the whole, to the Liberal Party that England owes its extension of the suffrage giving the working classes their opportunity in politics, it is to the Conservative Party that much of England's advance in industrial legislation must be credited. The first modern factory bill was brought in by the elder Peel in 1802, the first effective bill was that of 1833; and it is to Lord Ashley, afterward Lord Shaftesbury (*q.v.*), that we owe the ensuing bills of 1842, 1844, and, above all, the ten-hour bill of 1847. The Liberal Party of this epoch, led by the school of Cobden and Bright, was committed to suffrage reform and *laissez faire* in industry. Its leaders therefore, as a rule, bitterly opposed industrial legislation. The Conservative Party naturally, then, supported such legislation for two reasons: first, to oppose the Liberals, since the Conservatives were a party of the landlords and of "the country" in contrast to the free-trade manufacturers, who were largely Liberals; and, secondly, because the Conservatives numbered among themselves such zealous philanthropists as Lord Shaftesbury, who on somewhat paternal principles worked for the benefit of the oppressed workers in mines and factories. Thus early were sown the seeds of the later so-called "Tory Democracy." The bitterest opponent of this legislation was John Bright. We thus see the historic grounds for the connection between the Conservative Party and industrial legislation. Yet it took talent to develop this into a political factor, and this was largely done for the Conservative Party by Benjamin Disraeli. In 1845 Disraeli published his *Sybil*, and in this boldly advocated a so-called "Young England Toryism." He attacked the principles of Sir Robert Peel, and declared that Peel was leading the Conservative Party into the enemy's forts. He said that Peel "had caught the Whigs bathing, and run away with their clothes." He showed that the Reform Bill had created a young England, and that it was for the Conservative Party to champion the cause of industrial protection for the working classes against the middle class *laissez faire* of the Liberals. Whatever one may think of Disraeli, and whatever were his motives, there is no doubt that he followed this policy more or less faithfully through his brilliant career, and laid the basis of the Conservative policy which has extended the poor laws, assisted emigration, checked foreign immigration, and favored industrial legislation.

But the exactions of political situations have compelled both Liberal and Conservative parties in England to outbid each other in introducing popular legislation. The connection of the Liberal Party with the Irish Home Rule movement, having led Mr. Gladstone to extremely socialistic measures on the Irish land

question, the Conservatives, as usual, had to go them one better, and the result has been Lord Randolph Churchill and the Tory Radicalism of the so-called "Liberal Unionists." This meteor-like statesman outdid Disraeli in favoring radical legislation in order to win support for Conservative principles. In 1880 he began to develop his program, and by 1886 he was strong enough for a few months to have almost the key to the political situation. His program was non-intervention in foreign politics, reduction of army and navy expenditure, household suffrage, equal electoral districts, democratic elective councils, abolition of London coal and wine dues, free education, peasant proprietorship in Ireland by State purchase. With this radical program he succeeded in creating a strong following. In concert with his mother and wife, he formed the Primrose League. As chairman of the Conservative caucus, he placed this body on a democratic basis. More recently and more enduringly Mr. Chamberlain, with his "Liberal Unionists," has to an extent stood for the same policy, but with a distinct falling away from the progressive policy he so brilliantly carried out in Birmingham (*q.v.*). This radicalism has led to somewhat of an opposition in the Conservative Party, yet it has had its effect in the almost revolutionary extension of local self-government granted by the Conservative Government of 1888, and the extension of factory acts, truck acts, sanitary acts, Costigan's dwelling acts, the allotments acts of 1886—all of which are Conservative measures.

It is true that the Liberal Party (*q.v.*) in its Newcastle program has gone still further, but it shows why English working men, weary of the large promises and slight fulfilment of the Liberal Party, could, not without at least some excuse, vote for the Conservatives in 1895. Nevertheless, it must be said that the attitude of some of the Liberal leaders against the liquor interests had in many localities more to do with bringing the Conservatives into power than any particular fondness of the working classes for the Conservatives, and what was not due to this was rather due to dissatisfaction with the lack of action by the Liberals than hope of any action from the Conservatives. Nevertheless, some of the more progressive Conservatives have outlined something of a program on social reform. Sir John Gorst, writing in the *Nineteenth Century* for August, 1895, advocates the creation of permanent boards of arbitration and conciliation, with authority to conciliate industrial troubles, the employment of the unemployed by establishing free labor registries and experimental labor colonies, employees' liability laws, the adjustment of the poor laws to care for dependent children, placing them out when possible, and for the aged granting a free State pension. Mr. Whitelaw, Unionist, advocate for N. E. Lanark, advocated in the late election a resolute foreign policy to help trade, pensions for the aged, improved workmen's dwellings, compensation for accidents, boards of conciliation, increased inspection of dangerous trades, restriction of alien pauper immigration, reform of the licensing system, and of registration. It remains to be seen what the government will

do, but undoubtedly the majority of the party are not ready for all the above measures, and will probably carry out no more than they are obliged to. Few Socialists in England look forward with any hope to even the most alluring promises of this Tory Democracy. The Liberty and Property Defense League (*q.v.*) are doing all they can to protest against this incipient socialism of both the Conservative and Liberal parties. The Earl of Wemyss, speaking in the House of Lords August 15, 1887, protested against the "socialism at St. Stephen's," and declared that in that year alone there were 83 "socialistic" bills before Parliament, 39 brought in by Liberals and 44 by Conservatives. Yet when one compares the little done and the much promised, few friends of social progress in England believe that real progress will come from either party.

CONSIDÉRANT, VICTOR PROSPER, was born at Salins, Jura, October 12, 1808. He studied at Paris in the Polytechnic School, entered the army as an engineer officer, but resigned his commission in 1831 to spread Fourierite socialism. He took part in the socialistic experiment of 1832 at Condé-sur-Végre, and was associated with Fourier as editor of *La Phalanstère*. In 1834 Considérant published *La destinée sociale*, 3 vols. (1834-45). When Fourier died, in 1837, Considérant became the chief of the Fourierites; was editor of *La Phalange* (1836-43), and of a daily paper, *La Démocratie Pacifique* (1843-50). He was chosen to the Republican constituent assembly of 1848 as representative for Loiret. In 1849 he was returned as member for Paris for the Legislative corps, but on account of certain indiscreet acts he was soon compelled to retire from the country. He went to Belgium, and thence, in 1853, to Texas, where he afterward organized the unsuccessful socialistic colony of La Réunion. He was naturalized, and stayed in Texas till 1869, when he returned to live in quiet in Paris. Among his works are a *Manifeste de l'école sociétaire* (1841); *Exposition abrégée du système phalanstérien* (1841); *Théorie de l'éducation naturelle* (1845); *Principes du socialisme* (1847); *Théorie du droit de Propriété et du droit au Travail* (1848); *L'apocalypse, ou la prochaine rénovation démocratique* (1849).

CONSOLIDATION OF RAILROADS.
See RAILROADS; MONOPOLIES; TRUSTS, etc.

CONSPIRACIES (in Trade, etc.).—A conspiracy may be defined in general as a combination of two or more persons to commit in concert some reprehensible, injurious, or illegal act. Conspiracy laws are the laws forbidding such combinations. According to the common law of England, which is also the basis of the American law, conspiracy laws forbid combina-

(1) To falsely charge another person with a crime punishable by law. (2) To wrongfully injure or prejudice a third person, or any body of men. (3) To commit any offense punishable by law. (4) To do any act with intent to pervert the cause of justice. (5) To effect a legal purpose with a corrupt intent or by improper means. (6) Until recently and even now in malicious ways combinations to raise wages.

Under the United States laws the following are the

things a concerting to do which made between two or more persons constitutes the offense of conspiracy:

(1) An agreement to overthrow the Government of, or levy war against, the United States; to overthrow, put down, or destroy by force, or oppose the authority thereof; by force to prevent, hinder, or delay the execution of any law of the United States, or by force to seize, take, or possess any property of the United States, contrary to the authority thereof. (2) To deter a party or witness from attending or testifying in a court of the United States, or to injure one on account, or to influence a verdict or indictment by grand or petit jury, and to impede the due course of justice with intent to destroy equal protection of laws. (3) To hinder or prevent any person from voting or qualifying to vote at any election, or to injure, oppress, or intimidate any citizen in the full exercise or enjoyment of the right or privilege secured by the Constitution or laws of the United States. (4) To hinder by force or intimidation any person from occupying or holding office under the United States, or to injure such officer on account. (5) To induce any officer of the United States to leave any State, or to injure such officer on account. (6) To defraud the United States by obtaining approval of any false claim against the same. (7) To cast away any vessel with intent to defraud the underwriters.

General Laws.

Besides these the various States have their special laws. Criminal conspiracies in the United States consist not in the accomplishment of any unlawful purpose, nor in any one act moving toward that purpose, but in the actual concert and agreement of two or more persons to effect the unlawful thing so concerted or agreed upon. Mere concert in itself is not a crime, for associations to prosecute a felon have been held to be lawful; but it is the object or purpose of the concerting that make the offense. Where the object or intent if carried into effect would be a wrong, then concert is indictable, as an act in itself tending to produce it; as, for instance, to support a cause, in itself just, by false testimony. A combination to do a criminal act is indictable; also an agreement or confederation to do a lawful act by unlawful means; because, in the first instance named, the act being in itself criminal, a conspiracy to do it must in the very nature of things be also criminal, while in the second instance, the means being unlawful, it matters not what may be the act to be done.

In this cyclopedia we are specially concerned with the application of conspiracy laws to industrial combinations. For their application to combinations to raise prices, fares, etc., see MONOPOLIES. We consider here simply their application to combinations of working men—a subject which has a long and important history.

The general theory in the Middle Ages of the relation of the workman to the State was one of tutelage. The law undertook to control him at well-nigh every point. This was largely attempted through the guild. The old craft guilds were originally composed of apprentices, journeymen, and masters, joined in one association. As the guilds, however, grew in wealth they became more and more purely instruments of the masters to oppress the journeymen. These naturally resented this, and formed combinations of their own, usually secret, and sometimes under the guise of religious brotherhoods, but really organized to protect their rights. It was against these brotherhoods that the first laws concerning workmen's combinations were directed.

As early as 1383 the city authorities of London issued a proclamation forbidding all congregations, covins, and conspiracies of workmen in general. In 1387 three journeymen cordwainers were carried to Newgate for trying to found a brotherhood. In 1415 the brotherhood of Workmen's tailors was for a while suppressed. An early law of Henry VI. forbade the yearly confederation of the masons, on the grounds that these gatherings tended to destroy the force of the famous Statute of Apprentices, which had tried to fix wages at the wages

Workmen's Combinations.

of 1327. In 1548 a more general statute of Edward VI. prohibited all conspiracies and covenants not to make or do work but at a certain price, under penalty, on a third conviction, of a loss of an ear and the pillory. This act was not repealed till 1824. In the Elizabethan period the famous poor laws were passed decreeing that wages should be fixed by justices of the peace, etc. This led to numberless combinations and prosecutions, particularly during the eighteenth century. The earlier laws forbade combinations of masters and of workmen alike. The later laws were directed against workmen only. In 1799 they were combined in a general act, repealed and replaced the next year by 40 Geo. III. c. 106, which prohibited all combinations for raising wages or reducing hours. Mr. Justice Stephen says of this act (*History of the Criminal Law of England*, vol. iii., p. 20): "The only freedom for which it seems to me to have been specially solicitous is the freedom of the employers from coercion by their men." This act was in force till 1824, during all the period when the workmen were feeling the first results of the factory system, and were breaking machinery, etc. In 1803 three linen weavers were sent to jail simply for carrying a letter requesting help from other workmen. At last, in 1824, a change came, due to Joseph Hume, in Parliament, and Francis Place, a London tailor, out of Parliament. All previous statutes so far as they related to working men were repealed, and workmen combining to advance wages or lessen hours were not liable to prosecution for conspiracy. But the masters next year succeeded in changing this and replacing it by the 6 Geo. IV. c. 129. This new act, while it repeated the previous statutes, did not in express terms legalize combinations of workmen—the legality of such combinations was left to be dealt with by the common law—it simply rendered men liable to punishment for the use of threats, intimidation, molestation, and obstruction directed toward the attainment of the objects of trade-unions. A few alterations in the act were made by 22 Vict. c. 34. The recommendations of the royal commission of 1867 on trade-unions led to the repeal of the 6 Geo. IV. c. 129, and the 22 Vict. c. 34, by the 38 and 39 Vict. c. 31, and the 38 and 39 Vict. c. 32, which declared that the purposes of a trade-union were not to be deemed unlawful by reason merely that they were in restraint of trade, and carefully defined what acts should be deemed criminal offenses.

Present English Law.

The protection afforded by these acts was greatly diminished by the gradual extension of the common law doctrine of conspiracy, and at length, in 1875, the act was repealed and replaced by the Conspiracy and Protection Act, 38 and 39 Vict. c. 86. According to this act, an agreement between two or more persons to do any act in furtherance of a trade dispute is not indictable as a conspiracy if such act committed by one person is not punishable as a crime.

Such is a brief record of English legislation on this subject, but it does not show the bitter struggle of the working men against these combination laws. In 1834 the case of the six Dorchester laborers elicited general indignation. These poor and ignorant men, of good previous record and characters, were convicted nominally of administering unlawful oaths, really of committing the crime of combination. They were transported to Australia and sold to labor contractors for £1 per head. It aroused all English labor. A monster meeting was held in Copenhagen Fields, attended, it was said, by 400,000 persons; 50,000 workmen marched to the official residence of Lord Melbourne, presenting a petition for clemency signed by 266,000 persons. Pardon was finally granted against strong protests from the manufacturers, but was not properly promulgated, and some of the convicted only heard of it by accident after years of slavery. All through this period there were conspiracy prosecutions and condemnations. One of the most important of these was the prosecution of the Wolverhampton tin-plate workers in 1851, at a cost of some \$10,220. There had been a strike, and the strikers picketed the factory, and, inducing workmen to keep

away, had brought the business to a standstill. They were charged with conspiracy, and convicted under common law misdemeanor, punishable by two years of penal servitude. It was this conviction that brought the first modification of the law of 1825. In the sixties a series of conspiracy trials led to the commission of 1867, which resulted, in 1871, in the change of the law and a careful definition of what was a conspiracy in trade disputes. This law, tho generally an advance, on one point—the right of the workman to address another employee during a strike—was retrograde, and led to the great act of 1875. Since 1875 three main cases have arisen—those of the engineers' strike at Erith, of the shoemakers' at Bethnal Green, and the bricklayers' in Lambeth. The first was on a charge of "picketing," accompanied with approximate mobbing; the second was on a charge of picketing, with threats of personal violence, and, according to George Howell (*Conflicts of Capital and Labor*, 1878, p. 338), the men were condemned to two months' imprisonment, because they were unable to prove their innocence or disprove the evidence against them. The third case was a trial on charge of a strike, the accusers not bringing any charge of picketing or personal interference; the charge being not on the ground of strikes in general being a combination, but that this particular strike was a conspiracy. For the trial of John Burns and others at Old Bailey, and for similar trials on the charge of using seditious language, etc., see ENGLAND AND SOCIAL REFORM.

In the United States, the first trial for conspiracy to raise wages was in 1741, when certain journeymen bakers of New York City were convicted for conspiring not to bake till their wages were raised. It does not seem, however, that any sentence was passed. The first case of which complete records exist was the trial of journeymen boot and shoemakers of Philadelphia in 1806. They were found "guilty of a combination to raise their wages," and were fined \$8 each and costs. The next important case was that of the people of the State of New York against James Melvin and others in 1809. It was finally decided July 12, 1810, before the Mayor of New York City, against the men, because, tho possibly a combination not to work except for certain wages might not be indictable, they were organized to compel members of their union not to work if the union voted to strike.

The same position was taken in a court of quarter sessions for Alleghany County, Pa., when Judge Roberts said: "It is not for demanding high prices that these men are indicted, but for employing unlawful means to exact these prices, for using means prejudicial to the community. . . . A conspiracy to compel an employer to have only a certain description of persons is indictable." Similar verdicts were rendered in various trials.

In 1834, in Hartford, Conn., the Thompsonville Carpet Manufacturing Company brought suit against W. Taylor and others for conspiring to raise the price of wages, hindering others from working, and declaring a strike. The

United
States
Law.

defendants won. The court charged the jury that a peaceable arguing with workmen not to work except for a certain price was not a ground for civil action.

In 1840 certain journeymen of the Boston Bootmakers' Society were indicted for conspiracy in the municipal court. They were convicted in the lower court, but the Supreme Court did not sustain the verdict. It is claimed by labor leaders that the decision of Judge Shaw decided definitely that men have a right to combine to raise wages. The *Third Annual Report of the United States Commission of Labor* says (p. 1130) that this is a mistake, but that the verdict was not sustained simply because the indictment was not rightly framed.

Chief Justice Shaw, in his decision, said :

"The general rule of the common law is, that it is a criminal and indictable offense for two or more to confederate and to combine together, by concerted means, to do that which is unlawful or criminal, to the injury of the public, or portions or classes of the community, or even to the rights of an individual. This rule of law may be equally in force as a rule of the common law, in England and in this Commonwealth; and yet it must depend upon the local law of each country to determine whether the purpose to be accomplished by the combination, or the concerted means of accomplishing it, be unlawful or criminal in the respective countries."

"Without attempting to review and reconcile all the cases, we are of opinion, that as a general description, tho perhaps not a precise and accurate definition, a conspiracy must be a combination of two or more persons, by some concerted action, to accomplish some criminal or unlawful purpose, or to accomplish some purpose not in itself criminal or unlawful, by criminal or unlawful means."

The next important cases were those of the Master Stevedores' Association *vs.* Peter H. Walsh and others, decided in 1867, important because Judge Daly reviewed adjudications; and the case of some members of the Knights of Labor of District Assembly No. 91, arrested March, 1887, for alleged interference with the employees of John H. Hanan and Gardner & Estes, shoe manufacturers of New York City, important for the opinion delivered by Judge Barrett. Nevertheless, no new principles were established, and the case was appealed. Meanwhile, many of the States have enacted legislation on this subject.

In New York, by the act of 1870, labor unions are made lawful; also the peaceful and orderly combinations in any trade or profession to secure an advance in rates of wages or compensation, or maintenance of such; but combination of workmen to raise their wages by conspiring to compel journeymen to conform to rules established by the conspirators for the purpose of regulating the price of labor, and to carry such rules into effect by overt acts, are indictable, and not within the scope of the act. Several attempts have been made to do away with the operation of this act, by the enactment of others tending against the workmen, but they have not been successful.

In Pennsylvania, by the act of June 14, 1872, trade-unions were made lawful; the act provides that it shall be lawful for laborers, workmen, or journeymen, acting either as individuals or as members of any club, society, or association, to refuse to work or labor for any person or persons, whenever in his, her, or their opinion the wages paid are insufficient, or the treat-

ment of such laborers, journeymen or workmen by the employers is brutal or offensive, or the continued labor of such laborers, journeymen, or workmen would be contrary to the rules, regulations, or by-laws of any club, society, or organization to which he, she, or they belong, without subjecting them in so refusing to work or labor to prosecution or indictment for conspiracy under the criminal laws of the State; provided that the rules of such society shall not conflict with the constitution of the State, also that the act shall not prevent the prosecution and punishment under existing laws. This act was supplemented by the act of March 22, 1877, which in order to provide for the better protection of passengers upon railroads, and insure the prompt transportation and delivering of freight, enacts that in case of strikes by locomotive engineers and railroad employees, and the abandonment by them of their engines and trains at points other than their schedule destinations, endangering the safety of passengers and subjecting shippers of freight to great inconvenience, delay, and loss, it shall be a misdemeanor for any engineer or other employee to abandon engines and trains at points other than their destination, with a view to incite others to strike, or to refuse to give aid in the movement of cars of other companies, or to interfere with other employees, or to obstruct tracks or injure property of the company, and upon conviction punishes with fine and imprisonment. Such are examples of recent State legislation.

The recently commenced *Bulletin of the Department of Labor*, in its first number (November, 1895, p. 98), thus summarizes the present state of the common law bearing upon combinations :

"Every one has the right to work or to refuse to work for whom and on what terms he pleases, or to refuse to deal with whom he pleases; and a number of persons, if they have no unlawful object in view, have the right to agree that they will not work or deal with certain persons, or that they will not work under a fixed price or without certain conditions. The right of employees to refuse to work either singly or in combination is balanced by the right of employers to refuse to engage the services of any one for any reason they may deem proper. . . . In short, both employers and employees are entitled to exercise the fullest liberty in entering into contracts of service, and neither party can hold the other responsible for refusing to enter into such contracts."

It has been held, however, that employees in separate, independent establishments have no right to combine for the purpose of preventing workmen who have incurred the hostility of one of them from securing employment upon any terms, and by the method commonly known as blacklisting, debarring such workmen from exercising their vocation, such a combination being regarded as a criminal conspiracy.

On the other hand, a combination of employees, having for its purpose the accomplishment of an illegal object, is unlawful; for instance, a conspiracy to extort money from an employer by ordering his workmen to leave him and deterring others from entering his service is illegal, and an association which undertakes to coerce workmen to become members thereof or to dictate to employers as to the methods or terms upon which their business shall be conducted by means of force, threats, or intimidation

tion, interfering with their traffic or lawful employment of other persons, is, as to such purposes, an illegal combination. Commissioner Wright says, in the *World Almanac* for 1895 (p. 94):

"The States having laws prohibiting *boycotting* in terms are Illinois and Wisconsin.

"The States having laws prohibiting *blacklisting* in terms are Colorado, Florida, Georgia, Illinois, Indiana, Iowa, Missouri, Montana, North Dakota, Virginia, and Wisconsin.

"The following States have laws which may be fairly construed as prohibiting *boycotting*: Alabama, Connecticut, Georgia, Indiana, Maine, Michigan, Minnesota, Missouri, Montana, New Hampshire, New York, North Dakota, Oregon, Rhode Island, South Dakota, Texas, and Vermont.

"The following States have laws which may be fairly construed as prohibiting *blacklisting*: Maine, Michigan, Minnesota, New Hampshire, New York, Oregon, Rhode Island, South Dakota, Texas, and Vermont."

Recent decisions have, however, opened up the whole question. March 25, 1893, Circuit Judge Billings, at New Orleans, held that the terms of the Anti-Trust Act, in reference to combinations in restraint of trade, applied to laborers as well as capitalists, and that a combination to allow no work to be done in moving interstate commerce was within the prohibition of the statute; tho the mere refusal to work or a combination not to work, with no intimidation to prevent others from working, would not contravene the statute. April 3 of the same year Judge Ricks, of the United States District Court, at Toledo, O., having previously issued an injunction restraining the Lake Shore Railroad from refusing to take freight from or to the Ann Arbor Road, whose engineers were on strike, fined for contempt of court an engineer of the Lake Shore Road who refused to take a freight car from the Ann Arbor Line. At the same day and place Judge Taft, of the Circuit Court, granted an order restraining Chief Arthur, of the Brotherhood of Locomotive Engineers, from enforcing a law of their association requiring members to boycott freight and cars from any road on which a Brotherhood strike existed. Both of these decisions were based on the Interstate Commerce Act. April 8, 1893, Judge Speer, of the United States Circuit Court, at Macon, Ga., granted a petition of the Brotherhood of Locomotive Engineers, that the receiver of a road in the court's control should contract with the organization in reference to terms of service, tho he sustained the above decisions. December 19, 1893, Judge Jenkins, at Milwaukee, granted an injunction restraining the officers of an employees' organization from carrying out a threat to strike on a road in the receivers' hands. April 6, 1894, he modified the language, but insisted on "the right of a court of equity to restrain a strike on a railway."

April 5, 1894, the Circuit Court at Omaha refused, under similar circumstances, to enjoin employees from striking. October 1, 1894, the Circuit Court of Appeals at Chicago modified the decision of Judge Jenkins, and held that "the rule is without exception that equity will not compel the actual affirmative performance by an employee of merely personal services any more than it will compel an employer to retain in his personal service one . . .

who is not acceptable to him." The evils of strikes, it held, must be met by legislation, and "in the absence of such legislation the right of one in the service of a quasi public corporation to withdraw therefrom whenever he sees fit must be deemed so far absolute that courts of equity cannot interfere." But the injunction was sustained so far as it prohibited employees from combining or conspiring to quit the service of receivers with the object of crippling the property in their custody, either by obstructing the management or by using force or intimidation against employees who chose to work. For the recent developments of this question, see INJUNCTIONS.

CONSTITUTION OF THE UNITED STATES, THE.—For a general view of constitutions, see CONSTITUTIONALISM. We consider here the working of the United States Constitution especially in relation to social reform. The Continental Congress, which declared the independence of the United States, was a revolutionary body, called into existence by the necessity of common action between the colonies in protecting their rights, and when it was so voted, of obtaining their independence.

It gave itself, in 1777, a new legal character by framing the Articles of Confederation and Perpetual Union, whereby the 13 States entered into a "firm league of friendship;" but this confederation was rather a league than a national government. Each State, according to the articles, retained "its sovereignty, freedom, and independence, and every power, jurisdiction, and right which is not by this confederation expressly delegated to the United States in Congress assembled."

There was no Federal execution, no Federal judiciary, no Federal taxing power, no means of paying an army, or any Federal bills, save as the States voluntarily contributed money. The confederation did not work. It was, in fact, little better than anarchy, as men like George Washington declared. Some firmer union was evidently needed.

In 1786 delegates from five States met at Annapolis, Md., and recommended that Congress call a general convention to consider the condition of the Union and needed amendments to the Constitution. Congress did so, recommending the States to send delegates to a convention which should "revise the Articles of Confederation, and report to Congress and the several legislatures such alterations and provisions therein as shall, when agreed to in Congress and confirmed by the States, render the Federal Constitution adequate to the exigencies of government and the preservation of the Union."

The convention thus summoned met at Philadelphia on May 14, 1787, and became competent to proceed to business on May 25, and sat nearly five months. Every State was represented save Rhode Island. George Washington was chosen President, and the leading men of the country were the delegates. It boldly decided to prepare a wholly new Constitution, to be considered and ratified neither by Congress nor the State legislatures, but by the people of the several States. The delegates were 55, and 39 signed the Constitution; the debates were secret; the difficulties were very great.

Two tendencies manifested themselves, which led to the formation of the two great political parties which, under different names, have divided American political life. On the one hand was a strong desire for a national unity, with a highly developed central power; on the other, a still more powerful fear of centralization and

the desire to retain the sovereignty of each State. As is well known, the constitution adopted was a compromise between these two tendencies. The framers of the Constitution had the experience of the English

Fundamental Principles. Cabinet, its House of Commons, and its House of Lords. They had the State constitutions, which had to

an extent been modeled after the English pattern, modified by the peculiarities of the different States as they had grown up under the different charters originally granted to the different colonies. On the other hand, the minds, particularly of the Virginian delegates, were filled with theories regarding the natural rights of individuals, derived, in fact, from Rousseau and other French writers, and made them very jealous of granting power to any government. The Constitution framed was a resultant of these and other forces. The framers had in mind the principle of English common law, that an act done by any official person or law-making body beyond his or its legal competence is simply void, which principle Mr. James Bryce declares became the key to their difficulties. They carefully assigned to different branches of the government certain fixed forms which they held it necessary for them to hold, and all powers not mentioned were therefore retained in the hands of the people. They sought so to divide the powers between federal and State governments, and between the different branches of government, that no branch should absorb too much power or trespass upon the power of another branch.

September 17, the convention adjourned to submit its result to the people of the various States for ratification. Then began a struggle. It was declared by many that the Constitution gave too much power to the central government. Men said that liberty would perish. It was asserted that freedom won from George III. was being slain by her own children. The vote to ratify was nearly defeated in Massachusetts and New York. Several of the States suggested amendments, and most of these were adopted, in 1791, soon after

Adoption. the adoption of the Constitution itself, in ten amendments, called, after the English precedent, a Bill or Declaration of Rights. The first State to ratify the Constitution was Delaware, December 7, 1787. When nine States had ratified, the Constitution was to be adopted, and this was accomplished when New Hampshire ratified, June 21, 1788, by a majority of 11. Four days after Virginia ratified, not knowing of New Hampshire's vote; next New York and North Carolina. Rhode Island had sent no delegates to the convention, but finally ratified, May, 1790. Congress voted that the Constitution go into effect March 4, 1789. Elections had previously been held, and on that day the first Congress under the new Constitution met, but for lack of a quorum did not organize till April. Then the electoral votes were counted in the presence of both Houses, and George Washington was found elected President, and inaugurated April 30, 1789, in New York City.

The characteristic feature of the American Constitution is its union of Federal and State Govern-

ment. The Federal Government was restricted to the minimum of power necessary to a national union, yet the State governments were prevented from exerting undue power. **Analysis.**

The Constitution being a creature of the States, only the States can amend it. (See AMENDMENTS TO THE CONSTITUTION.) The States, too, form the national Government by choosing presidential electors, senators, and fixing the franchise which qualifies the citizens to vote for representatives. On the other hand, the Federal court is supreme in the interpretation of the Constitution, and can overrule any State or National legislation which it decides to be unconstitutional. (See JUDICIARY.) The President and Congress, too, have power over the States in certain specified matters, the presumption, however, always being in favor of the State. The States cannot make treaties, tax exports or imports, save with the permission of Congress. They must surrender fugitives from justice in other States. They can be sued by other States or foreign powers in Federal courts. Congress has power to establish uniform bankruptcy laws. Resistance to Federal authority or attacks on Federal property may be repulsed by Federal troops. In all other cases States are to act, tho they may call upon the Federal Government for aid.

The Federal Government comes into direct contact with the people of the States by the Federal courts, its taxing power, its power to raise an army, above all, by the election of Presidential electors and representatives to Congress by the people. It was on these two last points that the framers of the Constitution found their greatest difficulty. Whether the States should be represented in Congress as States, or simply by the representatives of the people, was a burning question. The smaller States desired representation as States, while the opponents of this position declared that this would be unjust, since it would give the few people in the smaller States equal power with the large populations in large States. The question, too, of States rights *versus* the Federal Government was involved. It was finally settled by having the members of one house—the Senate—elected by the State Government, and the members of the lower house—the House of Representatives—elected by the people, the number of the latter depending on the population of the State.

The election of the President caused even more discussion, but was finally decided by having the people choose electors who should choose the President. (For the working of this, see ELECTORAL COLLEGE.) The chief matters which, as national, were intrusted to the Federal Government were:

- The conduct of the national defense, and the making of treaties.
- The maintenance of federal courts.
- Commerce, foreign and domestic.
- Currency.
- Copyrights and patents.
- The post-office.
- Taxation for general purposes.
- Protection of citizens against unjust legislation by States (Amendments XIV, XV).

The three branches of Government established by the Constitution were the executive, the legislative, and the judicial. It was attempted to make these independent of each other and coordinate, with such a balance of powers that no branch could wield too much power. To the President (*q.v.*) is given the supreme executive power. He has command of the army and navy, he can make treaties and appoint ambassadors and consuls, but must have the advice and consent of the Senate. He appoints the judges of the Supreme Court and all high federal officers, but again must have the consent of the Senate. He can grant reprieves and powers except in cases of impeachment. He can summon both Houses on occasion. He can veto any bill or resolution of Congress. He must inform Congress of the state of the Union, and recommend legislation. He must see that the laws be executed. He is prevented from exerting too much power, because he can raise no money to pay an army; he can appoint no officers unless the Senate approves; he cannot prevent legislation passed over his veto; he can be impeached for faithlessness in office. The legislative power is given to the Senate and House of Representatives (*q.v.*). No federal officer can be a member of Congress. This is an attempt to preserve the independence of the legislature. It has the power to enact all federal laws, to vote taxes and appropriations, to borrow money, to regulate commerce, to coin money, to establish post-

The President.

offices and roads, to declare war, to raise and support armies, to determine the certificates and to count the votes of the Presidential electors, to impeach and to try the President, to judge of the elections, returns, and qualifications of its members. Congress is limited in the exercise of its power, because it cannot change the Constitu-

Congress.

tion, it can pass no bill unapproved by the President except by a two-thirds vote, and no bill of Congress is valid if declared to be unconstitutional by the Supreme Court. The members of the House of Representatives must be elected every second year by the people of their several States, and all bills for raising revenue must originate in the House of Representatives; but the Senate may propose or concur with amendments. To the Senate is given the power of approving or advising in the matter of executive appointments and treaties.

To the federal judiciary is given the power of interpretation of the Constitution, and the trial of all cases in law and equity arising under the Constitution, the laws of the United States, United States treaties, controversies between States, controversies to which the United States is a party, and controversies between

Judiciary.

a State and citizens of another State, or between citizens claiming lands under grants of different States, and between States or citizens and foreign States or subjects. (For the working of the federal judiciary, see JUDICIARY.) Its power is limited simply to the interpretation of the Constitution and of the law. Trials of all crimes, except in cases of impeachment, must be by jury. (See INJUNCTION.) All federal judges have a life tenure, subject to impeachment by the House of Representatives, and trial by the Senate. Such are the main features of the American Constitution. Certain actions are expressly forbidden. A writ of habeas corpus may not be suspended save in cases of rebellion or invasion. No tax or duty may be laid on articles exported from any State. No preference by regulation of commerce may be given to one State over another. No money may be drawn from the treasury save in consequence of appropriation made by law. No title of nobility may be granted, and no person holding office under the United States may receive a present or title from any king, prince, or foreign State. All duties, imposts, and excises must be uniform through the States. See also AMENDMENTS TO THE CONSTITUTION, forbidding any law respecting an establishment of religion, or curtailing the free exercise of religion, free speech, freedom of the press, the right to peaceable assembly, to petition Government, to keep and bear arms, to trial by jury on indictment by a grand jury for capital or infamous crime, and trial by jury in all criminal prosecutions. By other amendments, the powers not delegated by the Constitution, nor prohibited by it to the States, are reserved to the States or the people. No State may enact or enforce any law abridging the privileges or immunities of any citizen. The right of citizens to vote shall not be abridged on account of race, color, or previous condition of servitude. Neither slavery nor involuntary servitude, except as punishment upon conviction for crime, shall be allowed.

Such is a general account of the Constitution of the United States. Its practical working, while open to not a few serious criticisms, has undoubtedly been a success. Even its most serious defect may be said to be the result of its virtues. At the present time, when conditions are so different from those under

Successes.

which it was drafted, the Constitution, with its slow process for amendment, seems to bind the nation against its will and unduly check wise action. But this defect, if defect it be, is assuredly the result of the strength of the Constitution, and a strength absolutely needed both in the days of weakness when the nation was young, and in the days of strength when the nation was rocked with discussions over the question of State rights.

De Tocqueville 60 years ago was more hopeful of the future of the separate States than of

the Union. He believed that with the first serious difference in views the Union would be dissolved. At the time of the Rebellion most Europeans and some Americans believed that the end of the Union was come. A strong constitution was needed. To day the Union exists more firmly knit than ever, and no small part of this must be attributed to the wisdom and strength of the Constitution. Perhaps, too, the greatest triumph of the Constitution has been that it has so marvelously succeeded in its compromise between federal and State powers. This was the greatest difficulty presented to the framers of the Constitution; it has been till now the burning question of American politics. The Constitution has weathered the storm. A small republic is comparatively easy to conduct. In the United States alone are giant States confederated in one republic.

Again, the Constitution, for the first time in history, has enabled a great nation without radical constitutional changes to preserve popular liberties. In the late election of 1896 a people numbering over 70,000,000 went into an intense and even passionate contest, one in which the numbers on each side were about equal, which raised issues of section and still more issues of class—an election in which each party believed it stood for the preservation of liberty and for the defeat of principles subversive of honest and free government, and yet under a Constitution framed a century ago, the nation has come out of the conflict whole and unharmed. Surely such a Constitution has stood the test of time. It has succeeded, too, in the main in realizing that division of powers which its authors thought so necessary. The President has not been able to defy Congress; Congress has not been able to ignore the President. If the Supreme Court has been able to exert at times enormous power, it has, after all, usually but recorded the popular verdict. If, as a large majority believe, in 1876 a President duly elected was set aside for his rival candidate, the claims of the two were nearly equal, so that gross injustice was not done. If, more recently, a decision of the Supreme Court prevented an income tax which a large majority of the people desired, there can be no doubt that the decision will ultimately be reversed, provided the people continue to demand such a tax. No constitution can work without favor. Considering the vigor with which the nation has acted in emergencies and the moderation and freedom of its general policy, the experience of the century must be thought to bear out the verdict of Mr. Gladstone, that “as the British Constitution is the most subtle organism which has proceeded from progressive history, so the American Constitution is the most wonderful work ever struck off at a given time by the brain and purpose of man.”

There have been, however, notable failures in the working of the Constitution. Some of these we consider elsewhere. The plan of the electoral college has been a notorious failure. (See **Failures, PRESIDENCY.**) The whole presidential election machinery is out of gear and gives undue prominence to certain States and certain cities. Vast classes of citizens are

practically disenfranchised. (See PROPORTIONAL REPRESENTATION.) Congress has very serious defects. (See CONGRESS.)

Above all, the Constitution in many ways does not really give the people a chance to rule. It has been said that it is based on the theology of Calvin and the philosophy of Hobbes. It was the work of men who believed in total depravity, and they seem to have bound men at every point.

To many social reformers this seems the supreme vice of the American Constitution, that by its legalism, resting on individualism, it prevents strong social action. In the Federal Government, as in our States and cities, all powers not enumerated in constitution or in charter are reserved to the people—that is, to individuals. Democrat and Republican

Individualism.

may contend for strict or for broader construction, but both agree that what is not or cannot be read into the Constitution is illegal and unconstitutional. Back of Congress and above Congress is the sovereign State; back of the State and above the State is the town meeting; back of the town meeting and above the town meeting are John Smith and Henry Jones, and Congress may do only what John Smith and Henry Jones have contracted to allow Congress to do. This theory of the social contract is wrought into the very warp and woof of our national life. It, more than aught else, makes America the *bête noire* of all who would develop the social organism. Our government is not an organism, but a mechanism. We can do naught, because we have not the machinery, or rather because we have too much machinery. Is it proposed for the city to employ the unemployed, is Congress asked to attack the sweating system, the ardent reformer is told, not that the proposed action is impractical, not that it is unjust, but that it is unconstitutional; it is "not so nominated in the bond." Over America today there hangs a dead hand, born of the atomic or individual theory, that the State can only do that which sovereign and separate individuals have contracted that it may do. Such at least is the view of many American socialists.

Again, many criticise the Constitution as giving too much power to the Supreme Court. Since this court has the final decision as to what legislation is or is not constitutional, and since any legislation which it decides to be unconstitutional is thereby rendered null, the Supreme Court can, by forcing the Constitution (and what meaning cannot on occasion be read into any long legal document), prevent any legislation whatsoever that the Supreme Court happens not to fancy. The recent decision of the Supreme Court as to the unconstitutionality of the income tax is quoted as a case in point. For this matter, however, see JUDICIARY.

CONSTITUTIONAL AMENDMENTS.

See AMENDMENTS TO THE CONSTITUTION.

CONSTITUTIONALISM.—Most civilized States are governed under constitutions varying in form and precision.

The utility of a constitution for any given people must, of course, depend very greatly upon the nature and traditions of that people. There may be but a brief framework stating the trend of governmental authority and functions, or a definite plan of organization of the various departments. The constitution may be to guard the masses from the tyrannical power of an executive or despot, or to protect the people from themselves—*i.e.*, from the turbulent and ambitious elements and from the rash and hasty expression of popular feeling.

It is important, however, that a distinction be made between simple charters and bills of rights, and a form of government crystallized into a document which defines the scope and functions of departments and officers. The former long antedate the latter.

"A constitution is a system of principles, laws, and rules combined in a written document or established by prescriptive usage, for the government of a nation or State" (*Century Dictionary*). In strong contrast are the unwritten British constitution, composed of charters, traditions, and usages, and the recent State constitutions, which closely define the duties of officers and rigidly prescribe the limits of the several departments.

Altho writers upon the history of constitutions usually trace their origin to Magna Charta, or to the Roman laws of the twelve tables, or possibly even to the Ten Commandments, written constitutions, in the present understanding of the terms, have nearly all been made since the United States Constitution of 1787, and all have been greatly influenced by, if not mostly founded upon it.

The French people, in the years between 1789-91, framed a constitution to effect the change from an absolute monarchy to a limited monarchy. It was not modeled upon that of the United States or directly upon any other, yet the United States and English constitutions each were strong influences. The Massachusetts Constitution, mentioned below, was carried to France by John Adams and circulated to a limited extent in 1780; and Benjamin Franklin had already discussed with the French philosophers the Pennsylvania Constitution.

In 1783 Franklin published in the French language all of the constitutions of the 13 States of the new republic, with notes. These publications, with a vast array of historical causes, contributed to the form and matter of the Constitution of 1791. Ten other constitutions have been made by or for the French since that date—five of them republican and five of them monarchical. The organic law of the present republic, formed since the overthrow of Napoleon III., in 1870,

was adopted by the National Assembly at Versailles in 1875. It is the shortest of the written constitutions of important nations or States. The provisions are few and simple. The outlines of organization are given, and the remainder is to be provided for by ordinary statutes of the chambers. Precedents established in former constitutions and such provisions of earlier laws as are not incompatible with the new republican law still remain in force. The influence of the series of revolutions in France and elsewhere brought about constitutions in many of the smaller German States between 1820-36. The general political upheaval in Europe in 1848 and the few years following resulted in many more, the characters of which cannot be examined in a brief article.

Switzerland deserves notice, however, for one feature connected with its latest constitution. The first one formed in Switzerland was in 1793, on the pattern of that of the French republic. A civil war gave birth

History. to the constitution of 1848, and in 1874 the present one was adopted by a popular vote. In all but one (Freiburg) of the cantonal constitutions based upon and guaranteed by the federal constitution, the people have the right to demand that all important legislation be referred directly to them. "It may even be said that in some cantons the councils merely formulate the laws, while the people pass them" (Woodrow Wilson, *The State*, § 519). In general, however, the laws are submitted to popular vote only upon demand by petition of a specified number of voters.

The English Constitution is of another type, and yet, directly or remotely, has influenced nearly all others. It is a collective name for the principles of public policy on which the government is based. It embraces statutory law, custom, tradition, and precedent. No one document outlines the whole system of government. "The British Constitution is a barrier which yields under the pressure of circumstances as often as that pressure reaches a certain degree of intensity, but a barrier which never breaks, being steady and firm despite, or rather on account of its flexibility" (C. Borgeaud, *Political Science Quarterly*, vol. vii., p. 613). It is maintained not by safeguards formulated within itself, but because it has the sanction of time and the protection of a conservative privileged class and the loyalty of the people.

The British colonies in North America, Australasia, and elsewhere have written constitutions in general features conforming to the practices and precedents of the English Government, the most noteworthy being the responsible ministry.

The most recent government on earth (1894), organized under a written constitution, is the republic of Hawaii. Its fundamental law embraces provisions similar to parts of those of Great Britain and of the United States.

The South American States and Mexico, which achieved their independence of Spain in the first quarter of the nineteenth century, are all now living under formal republican constitutions. The limits of this article will not permit of an examination of either these or the afore-

mentioned English colonial constitutions. Sufficient to say, however, in all the recent ones the tendencies are markedly in the same directions as in those which will be considered more closely.

A constitution comes from a sovereign power, and its nature must depend, then, upon what power is recognized as sovereign. It may come from a king in the form of a charter or grant while he is absolute, and in order to get a recompense of some kind; later he may grant it because the people are so far recognized as the source of power that he is forced to a compact, so one is agreed upon by the ruler and the representatives of the people. Later, when the people are acknowledged as sovereign, the constitution proceeds from them—*i.e.*, they, by representatives, draw it up and then ratify it by a stipulated majority. **Theory.** The theory of the constitution is really far to seek. It is

found directly connected with the origin of a State. Three theories are proposed for the origin of a State—the theological, the historical, and the contract theory. The contract theory, the work of J. J. Rousseau, is interesting in this connection as a curiosity, and because so many of its expressions have crept into constitutions. The theory, in brief, is that a State originates in the agreement of individuals to establish it. The theory itself has often been refuted by showing that men have always been associated in groups, larger or smaller, and that society in this sense needs no definite agreement, but rather is a state of nature. It is certain that the idea of a contract only entered the comprehension of men ages after they had already well-established forms of society, ruler and ruled, law trials and judges.

The preamble of the Massachusetts Constitution of 1780 is so much like a quotation from Rousseau's *Contrat Social*, that the framers of that instrument must either have believed in Rousseau or have interpreted him in another manner than the common one—that is, instead of understanding his contract to be the basis of association, it may have been only a philosophical device for explaining the relations of the independent members of an already free State. The professing itself to be a contract between individuals, such a contract is really by the ratification of the citizens of the State, the fundamental law and not a mere contract and equalizer of rights.

We shall make no effort to detail the probable steps between the recognition of binding contracts as in practice by the Romans, charters of medieval towns and monasteries, and the nineteenth century State and national written instruments. All medieval charters, especially the Magna Charta, signed by King John in 1215, and early colonial charters have their place in the order of development of constitutions; but the Fundamental Orders of Connecticut (1639) is the first document which created a complete form under which a government was organized. This document, which was not superseded by a constitution till 1818, must be taken as the real and immediate origin of the present constitutions of Christendom. The Puritan is to be credited with the introduction of the written

constitution into political life. The Fundamental Orders of Connecticut was the first, and there were two others emanating from the Puritans in England in 1647 and 1653.

Whether a constitution, after it is ratified, shall be effective or not depends entirely upon how firmly its principles are already an accepted part of the national consciousness, and hence how far it faithfully reflects the national will.

Numerous instances might be cited where constitutions have either been imposed upon a people who did not thus already experience the sentiments contained in them, or

Authority. where people themselves, having overturned an existing government, have framed a constitution containing principles which call forth no patriotic response from the mass of the people. Constitutions, like poets, are not made. A constitution, to be at all effective, must be an evolution. No wonder that the new States of the United States should find their constitutions to work fairly well, and the numerous States nominally set free by France in her revolutionary period should find almost the exact opposite. In one case the whole experience of the past two or three generations has been in a constitutional atmosphere and in contact with the much praised and almost worshipped United States Constitution, while in the other a newly prepared paper constitution was presented to those who were almost totally unfitted for it by their previous political experience. It is not at all uncommon to find Americans and others who are such worshippers of their constitutions that they believe their principles to be of universal application, amazed to find that these constitutions, when imposed on people of different training, do not work satisfactorily.

In a period of 84 years, France has had 11 constitutions. The abandonment of one and the adoption of another has in each instance been accompanied by a revolution or a *coup d'état* or a national calamity.

The history of the South American constitutions is almost a continuous tale of adoption, revolution, and a new instrument. May it not be a pertinent question whether even a sovereign people have authority over the next and succeeding generations?

The authority of a constitution is certainly not sufficient to prevent revolution, yet often it has taken revolution to amend a constitution. Those who make a constitution, appreciating their own necessity for altering the form of government, should also appreciate that others may wish to modify theirs without the accompaniment of revolution.

The most important feature of American constitutions is the division of governmental powers into the three heads—legislative, executive, and judicial—and the definition of the powers of each. The main difficulties that have arisen among these departments have been from the encroachment of one department upon another. The numerous alterations in the State constitutions during the last 100 years have mostly been in the direction of limiting the functions of legislatures and enlarging the power of the executive. Possibly this has grown from

Principles. observing that in the Federal Government during the same period Congress has been encroaching on the executive, and it has been easier to modify the State constitutions than that of the United States. In both State and national government the judicial department has been steadily gaining in importance.

It is rather a disappointment to those who, in idolizing the Constitution, think that its framers were so inspired that they could strike off at once such a remarkable instrument, to learn that the Constitution is not nearly so much the result of inspiration and foresight as it is the result of a series of compromises. The compromises were the result of the collision in the convention of two forces which are present in all political bodies—viz., the centralizing and decentralizing, otherwise the aristocratic and democratic forces. The first class is fearful of the power of the masses, and the second of the tyranny of office-holders. The aristocratic faction fearing the thoughtless despotism of majority rule, endeavored to make a government popular in form, yet of such a nature that it could be controlled by a minority which would presumably be from the better side of society, and to so plan that amendments could with great difficulty be made and no radical change adopted as the result of popular clamor. With one party, then, in the convention fearing the masses, and the other a possible tyrant, the resulting Constitution was reasonably satisfactory to both, but for different reasons. John Adams, in a private letter, recapitulates the arrangements whereby one department acts as a check upon another. "First, the States are balanced against the general Government. Second, the House of Representatives is balanced against the Senate and the Senate against the House. Third, the executive authority is in some degree balanced against the Legislature. Fourth, the judiciary is balanced against the Legislature, the executive and State governments. Fifth, the Senate is balanced against the President in all appointments to office and treaties. Sixth, the people hold in their own hands the balance against their own representatives by periodical elections. Seventh, the legislatures of the several States are balanced against the Senate by sexennial elections. Eighth, the electors are balanced against the people in their choice of President and Vice-President" (*Works*, vol. vi., p. 467). If these checks were all operative now, just as was expected by those who placed them in the Constitution, the work of the Government would be even slower to express the real feeling of the nation than now. But even with the last-mentioned check entirely nullified, and some of the others not fully operative, through certain practices that have grown up, the work of government has in several instances been so clogged as to have well-nigh stopped.

It is very doubtful whether, in the development of society along the lines which are apparent, one generation ought to legislate for another. Each generation, perceiving its own needs and difficulties, and devising some means of satisfying and obviating them, also feels that if the arrangements by which they have surmounted difficulties can be made into fixed laws, then difficulties of the same kind will not

be repeated. It is very doubtful whether, in the development of society along the lines which are apparent, one generation ought to legislate for another. Each generation, perceiving its own needs and difficulties, and devising some means of satisfying and obviating them, also feels that if the arrangements by which they have surmounted difficulties can be made into fixed laws, then difficulties of the same kind will not

occur in the future. Thus those who planned the Constitution of 1787 intended to guard against innumerable possible dangers. One evidence that they cannot prepare for changed conditions is that the method planned for the election of

President, when tried, worked successfully for only four elections.

United States. An amendment was made and put into effect in 1804, so modifying the mode of election as to vote by the electors for President and Vice-

President separately. This portion of the provision is still operative, but the whole aim of separating the choice of President from the necessary excitement of popular election has been defeated, and the electors have become mere machines, to cast ballots according to instructions. This would be no calamity, but rather in accord with the growing tendency to elect all officers if the real voice of the people were heard, or even the voice of the majority. This, however, has not been the case. In several elections the successful candidates have not received a majority of the votes cast, and in two elections not even as many popular votes as the defeated candidates; but the only way in which the people have been able to express their dissatisfaction with the prescribed form in the Constitution has been by an evasion of the real intent in Article XII. of amendments in such a manner that the article is nullified without being violated in the letter. After the twelfth amendment, in 1804, no amendment was possible until the social upheaval caused by the Civil War, and it seems indeed apparent that no amendment further is possible without revolutionary proceedings and excitement.

In the absence of ability to amend there must be some way of permitting Government authorities to act according to the exigencies of the occasion, where there is no provision for or against, or where a literal reading would seem to obstruct. This way has been through the right of interpretation. Instead of seeking the probable intent of the writers of the document, there should rather be sought the view of the present political power—*i. e.*, the people. Under a government where the constitution is established and ordained by the people it is absurd to consider the people ruled by the thoughts or intents of a past generation. Their utterances, even though they be in the form of a fundamental law, can really be binding only when they are the reflection of the will of the living power. Hence in a government which rests ultimately for its support upon the whole people, or that portion of the people which molds public opinion, the interpretation of a constitution must be that which best reflects the "prevalent sense of right," or that which is the interpretation of the present possessors of political power. "The cases are not rare in which forced construction has been resorted to in order to justify the exercise of powers which are deemed necessary by public opinion. Nor can we expect to prevent altogether this tendency to strain and force the literal meaning of the constitution in order to bring it into conformity with that unwritten constitution which is the real constitution, and which embodies the living rules of conduct; for the unwritten constitution is steadily but

slowly changing under the pressure of popular opinion and public necessities, checked only by the popular reverence for the written word" (C. G. Tiedeman, *The Unwritten Constitution*, p. 136).

The following table of facts, obtained from the constitutions of all the States in the Union, will partially illustrate the tendencies of the present in constitution-making. The constitutions called "earliest" are those which were first actually put in practice in the government of each State, and were mostly adopted between 1776 and 1850, and the "latest" are mostly those which have been adopted since the Civil War. The earliest and latest of each State are the ones meant:

In the earliest constitutions 7 States had a 4-year term for governor.

In the latest constitutions 20 States have a 4-year term for governor.

In the earliest constitutions 12 States had a 2-year term for governor.

In the latest constitutions 18 States have a 2-year term for governor.

Two States have decreased the term of governor.

Five States have increased the term of governor from 1 to 4 years.

In latest constitutions 4 have term of governor 1 year.

In latest constitutions 2 have term of governor 3 years.

In earliest constitutions 9 elected governor by Legislature or by Assembly and Council.

In latest constitutions all elect governor by all voters.

In earliest 8 executives had a veto to be overruled by a majority.

In earliest 13 executives had a veto to be overruled by a two-third majority.

In earliest 10 constitutions had no provision on subject of veto.

In latest 4 constitutions have no provision on subject of veto.

No constitution before 1845 (Texas) gave the executive authority to veto items in a bill, and with this exception none fill after the Civil War.

In latest constitutions 5 pass a bill over veto by a mere majority.

In latest constitutions 24 pass a bill over veto by a two-third majority.

In latest constitutions 16 allowed items in bills to be vetoed. (Some confined to appropriations.)

In latest constitutions 30 have biennial sessions of the Legislature.

Fourteen of this 30 have been changed from annual to biennial.

One of this 30 have been changed from semi-annual to biennial.

One has changed from semi-annual to annual.

Fifteen Legislatures have always been biennial.

In earliest constitutions 4 have members of lower House hold 2 sessions.

In latest constitutions 6 have members of lower House hold two sessions.

Tho the people themselves are responsible for the legislators whom they are unwilling to trust, they have in all the more recent constitutions so shown their distrust as to make the constitution in length more like a code of laws, and have imposed restrictions of various kinds upon the legislative power. Several causes may be assigned for this untrustworthiness in legislatures, such as the spoils system, the political boss system, small salaries, suggesting dishonest dealings with public money, etc.; hence special legislation in certain enumerated cases is prohibited. These prohibitions amount, in the Constitution of Montana, to 35, and in that of North Dakota to 100.

Another method which legislators have used for making questionable laws is by means of riders to appropriation bills, and by introducing doubtful appropriations into general appropria-

tion bills. The people have guarded against this to a certain extent by giving to the governor in at least 16 of the States the right to veto particular items in a bill, while endorsing the remainder and causing it to become a law.

All the latter constitutions are really of a different class from the older ones, and represent new tendencies in the people. This is especially apparent in the development of the fourth department of government—viz., the administrative. In a few States this is made a distinct department of government, but in general it has not yet been separated from the executive. Certain bureaus and officers, such as those of agriculture, railroads, land, and insurance commissioners, indicate direct connection of the economic interests of the people with the administration of the States. The people in the early days of the republic knew nothing of these interests, and were quite content to leave them all to the Legislature. But now the skill of experts to collect and classify information in these various fields is demanded in order that legislation may be intelligent rather than experimental, and to the immediate welfare of the whole people. These officers are now in every State chosen by the qualified electors instead of by the legislatures, and indeed nearly all officers which were in the earlier constitutions appointed by the Legislature are now chosen at a general election. The State judiciary is also now elective.

In addition to reducing the frequency of legislative sessions, the length of session in many of the States is limited to a period of from 40 days (the briefest) to (in general) 90 days, or by prescribing a definite salary for the whole period, thus offering an incentive to briefness; or a per diem compensation, to be stopped after a specified number of days. The multitudinous restrictions placed in all the more recent constitutions on legislative, executive, and other State officers shows clearly the desire of the voters to retain power in their own hands.

While the great length of the later instruments would seem to indicate a crystallization of the governmental powers, and hence the removal of them from the people, in truth the opposite of this is the case. The ease of amendment by general vote, the checks put on the officers, the change in several instances of the impeaching power from the Senate to the Assembly—these and other considerations point rather toward a retaining of the powers of the government in the hands of the people.

In the preamble or bills of rights introducing most of the constitutions, the statement is curiously made that all political power is inherent in the people.

A feature of the Constitution of Washington of 1789 is the provision for home rule in the cities—*i. e.*, the charters, instead of being granted by the Legislature, as in other States, are to be framed by the inhabitants—a noticeable step in the direction of real democracy.

Trusts and monopolies, developments of the last few decades, are not left open to arrangements by and with the legislatures, but are regulated by a code of laws enacted by all electors and embodied in the constitution under the head of provisions for "Corporations other than Municipal."

Between 1776 and 1894, 111 constitutions have been adopted in the United States. This, of course, means that many of the States have remodeled or made anew their constitutions, as well as that Territories have made constitutions and become States. One State only (Massachusetts) has lived the whole time under one constitution, while Kansas has changed her constitution oftener than any other State. Only 14 of the States retain their original constitutions, and six of these are the recently admitted ones—Montana, Washington, the two Dakotas, Idaho, and Wyoming.

The United States Constitution, lacking flexibility, has failed to allow for changed conditions, and has been modified only by the effects of war, by nullifying portions in spirit if not in letter, and by forced construction. According to the present trend of present national life, amendments would seem to be demanded for the election of United States Senate, President, and Vice-President by direct vote.

The modifications of State constitutions—viz., increasing power of executive, curtailing power of legislative departments, shortening legislative sessions in length and frequency, election of many officers formerly otherwise chosen, embodying in the constitution laws concerning tendencies regarded as dangerous—all are indications of the sovereign people's determination to retain in their own hands the actual management of government, and to delegate power solely for purposes of administration, and that in such a manner that all responsibility can be located.

The reforms which are next likely to be proposed are the referendum and proportional representation. (See REFERENDUM; PROPORTIONAL REPRESENTATION.)

Perly Poore; *The Unwritten Constitution*, by C. G. Tiedeman; *Johns Hopkins University Studies* (third series); *The Constitutions (Documents) of the New States*, by George Emory Fellows.

CONSUMPTION may be defined in social science as the use of commodities or of anything having exchange value (*q. v.*).

"Consumption," says Adam Smith, "is the sole end and purpose of all production, and the interest of the producer ought to be attended to only so far as it may be necessary for promoting that of the consumer." "Later criticism," says Professor Nicholson in *Palgrave's Dictionary of Political Economy*, "has thrown doubt on the possibility of making such a sharp distinction between the interests of producers and consumers. Apart from women, who are largely employed in domestic duties, and old men, invalids, and children, the number of those returned in the census of any civilized country as 'unoccupied' is extremely small, and thus the great majority of the adult males are both producers and consumers. Accordingly the conditions as regards health, variety, moral and intellectual effects on the worker of the work done, etc., are of coordinate importance with the amount and quality of the definite commodities consumed."

J. S. Mill (*Polit. Economy*, bk. 1, chap. iii., sec. 5) makes the important distinction between productive and unproductive consumers. He says: "All the members of the community are not laborers, but all are consumers, and consume either unproductively or productively. Whoever contributes nothing directly or indirectly to production is an unproductive consumer."

The only productive consumers are productive laborers: the labor of direction being, of course, included, as well as that of execution. But the consumption even of productive laborers is not all of it productive consumption. There is unproductive consumption by productive consumers. What they consume in keeping up or improving their health, strength, and capacities of work, or in rearing other productive laborers to succeed them, is productive consumption. But consumption on pleasures or luxuries, whether by the idle or by the industrious, since production is neither its object nor is in any way advanced by it, must be reckoned unproductive; with a reservation, perhaps, of a certain quantum of enjoyment which may be classed among necessities, since anything short of it would not be consistent with the greatest efficiency of labor. That alone is productive consumption which goes to maintain and increase the productive powers of the community; either those residing in its soil, in its materials, in the number and efficiency of its instruments of production, or in its people."

For an analysis of consumption and the amount of consumption of various utilities by various nations and classes, see EXPENDITURE.

The subject of consumption is specially treated in Roscher's *Political Economy* and in Schönberg's *Handbook*, by Professor Lexis.

CONTINENTAL CURRENCY. See CURRENCY.

CONTRACTION AND EXPANSION OF CURRENCY.—There are few monetary questions more important than that of the contraction and expansion of the currency. We shall consider the subject under four heads, supporting each point by quotations from recognized authorities, and in case of divergence of view, from representatives of the various views. We consider:

- I. The Economic Principles Involved.
- II. The Practical Importance of the Subject.
- III. The Facts as to the United States.
- IV. Proposed Remedies.

I. THE ECONOMIC PRINCIPLES INVOLVED.

These, fortunately, are not in debate. Upon them all economists are practically more agreed than upon almost any other principles in economic science. They are:

(a) That a contraction of the currency tends to lower prices, and, *vice versa*, that an expansion of the currency tends to raise prices. Says Ricardo:

"That commodities will rise and fall in price in proportion to the increase or diminution of money I assume as a fact that is incontrovertible. That such would be the case the most celebrated writers on political economy are agreed."

Says Jevons (*Primer of Political Economy*, chap. xii., p. 79): "If the quantity of money increases, its value is likely to decrease, so that more money is given for the same commodity, and *vice versa*."

Says Mill (*Political Economy*, Book III., chap. viii., § 2): "If the whole volume of money in circulation were doubled, prices would double. If it was only increased one fourth, prices would rise one fourth."

Says President Walker: "That prices will fall or rise as the volume of money be increased or diminished is a law that is as unalterable as any law of nature."

The reason for this is of course simple. When a currency expands there is more money to meet the demands of trade. People are able to

give more to purchase what they desire; hence the seller can raise his prices. It is, of course, implied that the currency has expanded *more than the demand for it*. If, as is often the case, a slight expansion of currency is accompanied by a greater expansion in the volume of exchanging, so that more currency is needed, the slight absolute expansion of the currency is more than counterbalanced by the greater expansion of the need or demand for it, and there is, therefore, virtually not an expansion but a contraction of the currency, and prices fall instead of rising. Of course also by expansion of currency is meant currency *in circulation* actually available for making exchanges. If in any country currency is coined or issued, no matter in how great quantities, and is locked up either in government vaults or withdrawn from active circulation by private or other cornering of the money market, there is no real expansion of the currency. But, allowing for these two simple and yet not always remembered exceptions, or apparent exceptions, the above principle invariably holds.

(b) Economists are agreed that it follows from the above that a contraction of the currency tends to benefit the credit class, and that, *vice versa*, an expansion of the currency tends to benefit the debtor class. Says President Andrews (*An Honest Dollar*, p. 8):

"Increase in the value of money robs debtors. It forces every one of them to pay more than he covenanted—not more dollars, but more value, the given number of dollars embodying at date of payment greater value than at date of contract. Decrease in the value of money robs creditors, necessitating each to put up, in payment of what is due to him, with a smaller modicum of value than was agreed upon."

**Contraction
Tends to
Benefit Credit
Class.**

Says Professor Symes (*Political Economy*, p. 109):

"If prices have risen by 20 per cent. it is little satisfaction to the creditor that he is receiving the amount in money that was promised him, for he can now only purchase 10 things with that which when the loan was made would purchase 12. Every rise in prices benefits debtors at the expense of creditors; and conversely every fall in prices benefits creditors at the expense of debtors."

So substantially say Jevons, Walker, Chevalier, and all authorities, altho all have not realized the importance of the subject. It should, however, be realized what this means. The credit class is, generally speaking, the small class who live directly or indirectly upon investments. The debtor class is the large class of producers in any nation. Contraction of the currency, therefore, aids the investor as an *investor*, and expansion aids the worker.

A full amount of currency, aiding the producing class, who are also the main consumers of any country, creates a demand for goods, stimulates trade and investment, and so very materially aids every wage-worker. This is true, of course, only of an expanding *sound* currency. Expansion of an unsound currency eventually at least aids no one except a few speculators, and hurts the wage-worker most of all. But this is another, altho most important question. (See MONEY.) In this article we are concerned simply with the quantity, not with the quality of money.

We consider at this point one objection sometimes raised. It is said that the farmer is not hurt by a contracting currency, because, though he receive less, he has to pay out less; but the mortgaged farmer has already made his main purchases when prices were *up*, and now has to sell when prices are *down*. Turn it, therefore, which way we will, producers, including farmers, wage-workers, professional men *whose salaries or incomes are liable to change*, and small manufacturers or storekeepers, *who are conducting business on borrowed capital*, are hurt by a contracting currency, while the non-producing classes—capitalists of all kinds and men *whose salaries are not exposed to change*—are hurt by an expanding currency.

(c) Economists are agreed that what is wanted is an "elastic currency"—that is, a currency that can decrease in volume when prices go up and increase when prices go down, thus operating to check the increase and decrease. Exactly on what basis this should be done there is, however, disagreement.

Gold monometallists hold that the general price of labor should remain constant, so that the debtor may return as much command over labor as he originally received. Bimetallists affirm that the general price level of commodities should remain constant, so that the creditor should receive no more command over consumption goods than he originally loaned.

A more subtle plan recently proposed by Professor E. A. Ross, in the *Annals of the American Academy* (November, 1893), holds that *total utility*, and not either the amount of commodities or their labor cost, is the standard to which money should conform in order to do justice as a standard of deferred payments. But whatever be the standard, all are agreed that currency should change in quantity to balance the rise and fall in prices.

Says President Andrews (*An Honest Dollar*, p. 8):

"Were money merely a medium of exchange, something to be spoken into being for each act of traffic and then annihilated, permanence in its worth could be dispensed with. But money, also, besides furnishing our system of value-denominations, measures value, serves as a reservoir of value, and as a standard for deferred payments. To fulfil ideally any one of the last-named offices it must preserve its general purchasing power unchanged."

Said Major Winn, of Massachusetts, in a speech in Faneuil Hall, October 7, 1891:

"What is an honest dollar? What do you use dollars for? A measure of value, of course, a yardstick for your exchanges. Now, if you were exchanging cloth in the market, what would you think of a yardstick which some days was a few inches too long, and others a few inches too short, but, on the whole, was steadily growing longer? You wouldn't call it an honest yardstick. . . ."

"The only honest dollar is a dollar invariable in value relative to the mass of commodities in general, as other weights and measures are relatively to their standards. Can we produce it? We keep the standards of weight and measure under glass, that a breath may not affect or a grain of sand abrade them. Why not use equal care with the standards of value?"

Says Professor Commons, of Syracuse University (in *The Voice*, September 14, 1893):

"An elastic currency is one in which the volume of money expands at the time when prices begin to fall, thereby preventing the fall, and in which, on the other

hand, the volume contracts when prices show a tendency to rise, thus preventing the rise."

To this we say all economists are agreed—that is, as to its desirability. Whether it is possible to have such a dollar is another question, and one on which economists are not agreed. But as to its desirability there is no question. No one desires a yardstick which, when one makes a loan, measures one yard, and when one comes to return the loan measures off twice as much cloth and calls it one yard.

We pass, then, to consider

II. THE PRACTICABLE IMPORTANCE OF THE SUBJECT.

This is also admitted to-day by all thinkers, although it has not always been sufficiently realized. Says President Andrews (*An Honest Dollar*, p. 13):

"Jeavons, at any rate, is too moderate. After enormous admissions touching the ravages of changing currency values, he almost apologizes for the change in money value, on the ground that the sorrows springing from it are mostly occult, and that the people habitually refer them to other causes. The question is not whether the infelicities accompanying these monetary vicissitudes are appreciated or not, but whether they are real and serious. That they are both will be the conviction of every student in proportion to his acquaintance with them. . . . It is certain that none who have not made the subject a study at all adequately conceive the magnitude of the evil."

Says Professor Commons (*The Voice*, September 14, 1893):

"What is the significance of price fluctuations? Nothing less than the very essence of modern industry. . . . It is estimated that the debts of the world are \$100,000,000,000. Every nation, State, county, city, and township is a debtor. These debts run from three months to three decades. All business and productive enterprises are a speculation. The farmer borrows money expecting to sell wheat at a certain price and pay his debt in money. Meanwhile, the price of wheat falls 50 per cent. Where one bushel would have paid his debt when contracted, it now requires two bushels, and the burden of the debt has grown 100 per cent. During the past 20 years this is exactly what has occurred. . . . When we consider that the private debts of the country are one half the value of the country, it is no wonder that panic, depression, idleness, and despair are upon us." (For statement as to the public debt, see later on in this article.) At the last Paris Monetary Conference of the leading financiers of the world, President Andrews says (see *MONEY CONFERENCE*): "The vast injustice which the fall of prices causes in the payment of debts and the fulfilment of contracts was dwelt upon somewhat—less, doubtless, than would have been the case had it been seriously questioned by any." Mr. Balfour recently said before an audience of London bankers and merchants, "It is perhaps the most deadening and benumbing influence that can touch the enterprise of a nation." With these statements from trained economists there is no need to quote, and there is much excuse for the sometimes hysterical utterances of the papers and leaders of the farmers' movement in this country, who hold that by contraction of the currency they have been deliberately robbed over and over again.

It is of far more importance to pass on to consider

III. THE FACTS IN THE UNITED STATES.

These can be fully studied only in a complete review of the currency of the United States. (For this, see CURRENCY.) We here consider only such facts as bear directly upon the case, and mainly those since the war. For the ante-bellum period we present from Amasa Walker (*Science of Wealth*) the following charts :

This diagram shows at once how close general prosperity, as measured by imports, follows upon an increased currency. Taken with the next diagram, which we print in the next column, taken from the same source and showing how closely prices follow fluctuations in currency, we have the clearest possible evidence both of the truth of principles asserted above in this article, and also of the vast importance of the subject to the general prosperity of the nation. Discussions about the inflation or contraction of currency usually turn about conditions since the war. It is well to have this plain showing drawn from ante-bellum facts. Had we room we could quote still other of Mr. Walker's admirable charts, showing the effect of an increased currency in still other directions, all proving the intimate connection between an abundance of good currency and national welfare.

For the period since the war we must ask two

questions : First, has the currency expanded or contracted in volume? Secondly, how have general prices changed? We shall then be in

DIAGRAM.
Showing the Corresponding Fluctuations in Currency and Prices for 26 years.
1834-1859.

a condition to see how the problem of currency contraction and expansion really affects the United States. We ask :

(a) *Has there been contraction or expansion of our currency since the war?*

This is a disputed point. We shall give both sides.

According to the authorities at Washington, no contraction has taken place. In the reports of the Secretary of the Treasury appear the data printed in the table on the next page.

It should be presumed, however, that the data reported by the secretary are really misleading on several points. He gets the per capita circulation by dividing the total amount in circulation by the total population ; but during the war millions of people in the South were not using United States money—at least not entirely. They had a currency of their own. The secretary should either have divided the currency only by the Northern population, or have added the Southern currency to the Northern and have divided by the total population. Either process would show a larger per capita circulation during the war days.

STATEMENT SHOWING THE AMOUNTS OF MONEY IN THE UNITED STATES, IN THE TREASURY AND IN CIRCULATION, ON THE DATES SPECIFIED FROM 1860 TO 1892.

YEAR.	Amount of Money in United States.	Amount in Circulation.	Population.	Money per Capita.	Circulation per Capita.
1860.....	\$442,102,477	\$435,407,252	31,443,321	\$14.06	\$13.85
1861.....	452,005,767	448,495,767	32,064,000	14.09	13.98
1862.....	358,452,079	334,607,744	32,794,000	10.96	10.23

1880.....	1,205,929,197	973,382,228	50,155,783	24.04	19.41
1881.....	1,406,541,823	1,114,238,119	51,316,000	27.41	21.71
1882.....	1,480,531,719	1,174,290,419	52,495,000	28.20	22.37
1883.....	1,643,489,816	1,230,305,696	53,693,000	30.60	22.91
1884.....	1,705,454,189	1,243,925,969	54,911,000	31.06	22.65
1885.....	1,817,658,336	1,292,568,615	56,148,000	32.37	23.02
1886.....	1,808,559,694	1,252,700,525	57,404,000	31.50	21.82
1887.....	1,900,442,672	1,317,539,143	58,680,000	32.39	22.45
1888.....	2,062,955,949	1,372,170,870	59,974,000	34.39	22.88
1889.....	2,075,359,711	1,380,361,649	61,289,000	33.86	22.52
1890.....	2,144,226,159	1,429,251,270	62,622,250	34.24	22.82
1891.....	2,195,244,075	1,497,440,707	63,975,000	34.31	23.41
1892.....	2,372,599,501	1,601,347,187	65,520,000	36.21	24.44
1893.....	2,323,402,392	1,596,701,245	66,946,000	34.70	23.85
1894.....	2,421,461,747	1,661,835,674	68,397,000	35.40	24.30

NOTE.—The difference between the amount of money in the country and the amount in circulation represents the money in the Treasury.

Currency certificates, act of June 8, 1872, are included in the amount of United States notes in circulation in the tables for the years 1873-91 inclusive; in 1892 they are reported separately.

The foregoing tables present the revised figures for each of the years given.

This assuredly seems to show that our currency in the United States has not been contracting, but steadily expanding. Equally assuredly, however, there is another and a *more important side*. Vast portions of this currency are not available for the common people, and some portion of this claimed currency is not available for any one.

According to the Treasurer's report for 1892, for example, of the \$1,601,347,187 reported in circulation July 1, 1892, \$408,568,824 was in gold coin. Now, except on the Pacific slope, the common people do not see gold from year's end

to year's end. Large amounts of money, too, are known to be hoarded, and therefore not in circulation, but which the report counts as in circulation. That this amount is included in the report may be shown by going still further into details. The report of the Director of the Mint (p. 161, *Treasurer's Report*) shows how the amount of gold in circulation is obtained. It says:

"The ownership of the stock of United States coin and of the gold and silver bullion in the country on July 1, 1892, is exhibited in the following table:

OWNERSHIP OF GOLD AND SILVER IN THE UNITED STATES JULY 1, 1892.

OWNERSHIP.	Gold Coin and Bullion.	SILVER COIN AND BULLION.				Total Gold and Silver Coin and Bullion.
		Silver Dollars.	Subsidiary Silver Coin.	Silver Bullion.	Total Silver.	
United States Treasury.....	\$114,601,767*	\$39,308,448†	\$14,224,714	\$77,068,783	\$121,601,945	\$236,203,712
National banks (July 12, 1892)...	190,751,183‡	32,089,995§	5,579,392	38,569,297	229,320,480
Private banks and individuals...	358,922,385	350,690,292	57,717,462	1,734,548	410,142,302	769,064,687
Total.....	\$664,275,335	\$413,988,735	\$77,521,478	\$78,803,331	\$570,313,544	\$1,234,588,879

* Gold coin and bullion in Treasury, exclusive of \$147,235,339 gold certificates outstanding.

† Silver dollars in Treasury, exclusive of \$326,880,803 silver certificates outstanding.

‡ Includes \$94,028,100 Treasury and clearing-house gold certificates.

§ Includes \$25,523,399 silver certificates held by national banks.

And (p. 160) it says :

"It may be proper to repeat here that the basis of the annual tabulations of the stock of gold coin in the United States was the actual amount of gold coin in the Treasury and in national banks on June 30, 1872, with an addition of \$20,000,000 as an estimate of the minimum amount of gold coin in circulation in the States of the Pacific Slope.

"No allowance was made in the initial estimate for any stock of gold outside of the Treasury and national banks or for any gold in circulation in the States east of the Rocky Mountains.

"Since that date the official estimates presented from year to year have been compiled by adding to the actual visible stock June 30, 1872, the coinage of the mints (less recoinage of our own coins) and the gain (or loss) by import and export of our own coin as registered at the custom houses, with an annual allowance for melting of United States coin for use in the industrial arts based upon three censuses taken by the Bureau of the Mint of the jewelry trade.

"In the case of silver the stock of silver dollars is estimated to be the coinage since March 1, 1878, and the stock of subsidiary silver coin the coinage since 1873, with an estimate of the amount in the country at that date of \$5,000,000, and the annual gain or loss by coinage and import and an annual allowance for melting in the industrial arts, as in the case of gold."

Statistics.

There is, therefore, no slightest allowance here for money hoarded, lost, or taken by emigrants and others out of the country but not registered at the custom-house. All moneys coined since 1872 in the case of gold, and since 1878 for silver, are considered by the treasurer as in circulation. That this is not the case; that large amounts have been hoarded, lost, or taken from the country is notoriously true, tho statistics of the amounts may not be available. Unquestionably, therefore, the reports include from this cause moneys in circulation that cannot be properly so called.

Again the report misleads because it does not fairly represent the circulation in the later war days.

The secretary's report states the "amount in circulation" in 1865 to have been \$714,702,995. This evidently includes only United States notes (greenbacks) and notes of National and State banks and coin, and omits all interest-bearing legal tenders. When Hugh McCulloch was Secretary of the Treasury in 1865, he stated the paper circulation to be substantially as follows :*

United States notes and fractional currency	\$454,218,038
Notes of National banks.....	185,000,000
Notes of State banks.....	65,000,000
Estimated 5 per cent. and compound interest notes.....	30,000,000
Total.....	\$734,218,038

The last item here mentioned is conceded by Secretary McCulloch as being too low. It does not include any of the seven-thirties, of which \$30,000,000 were outstanding (p. 17). "Many of the small denominations (he says) were in circulation as money, and all of which tend in some measure to swell the inflation" (p. 9). The total quantity of interest-bearing legal tenders outstanding October 31, 1865, were (see Report, p. 17):

Compound interest notes.....	\$173,012,141
Seven-thirty Treasury notes.....	830,000,000
Treasury notes 5 per cent.	32,536,901
Total.....	\$1,035,549,042

To what extent these notes should be counted as circulation is doubtful. Certainly the amount held by banks should be so considered in so far as they were a legal reserve against deposits. The comptroller reports the banks as holding \$74,261,847 compound interest notes, and estimates that \$10,000,000 besides are in circulation. (*Report on the Finances*, 1865, p. 64.)

* See *Report on the Finances*, 1865, pp. 9, 10.

The fact is, that besides the \$714,000,000 given by the secretary in 1862, there were also \$1,000,000,000 latent legal tenders which were alternately being injected into and withdrawn from circulation, and which were a legal tender together with their accumulated interest. A conservative estimate would place the circulation at \$800,000,000 in 1865. Now the population for 1865 is stated in the report of 1862 to have been 3,474,000. This evidently includes 9,000,000 population of the Southern States, which had its own Confederate currency. If the secretary wishes to calculate the per capita circulation for 34,000,000 people, he should include the currency used by all those people. Otherwise he should deduct the 9,000,000 Southern population, leaving 25,000,000 Northerners with \$800,000,000 currency, equal to \$32 per capita instead of the \$20.58 actually estimated.

The contraction of the currency, therefore, from 1865 proceeded from \$32 to \$15.32 per capita in 1878, when it was arrested by the Bland Bill.

Since 1878 there has been an apparent expansion to \$24.30 per capita; but this has been in subsidiary and token money, and not in the standard money—gold; whereas the contraction from 1865-78 was a contraction of what was then the only effective standard—paper money.

And this takes into no account the increase of business over the increase of population. We shall consider this more at length in a moment, but must first note an objection that seems to vitiate our argument. It is said that the amount of currency really makes very little difference, because the vast majority of our monetary transactions are done, not by money, but by instruments of credit for which money only furnishes the basis. The one thing we are told is to have this basis reliable and trustworthy; its amount matters little. Professor Commons (in the article above mentioned in *The Voice*) has well stated the objection and well answered it.

"There is a current statement emanating from the reports of the Comptroller of the Currency, and based on the statements of bank officers throughout the Union to the effect that only 7 per cent. of the business of the country is paid for in cash; the other 93 per cent. is represented by credit instruments, such as checks and drafts. From this statement it is sought to minimize the share of money in influencing the range of prices. The conclusion is reached that 93 per cent. of general prices is based on credit and only 7 per cent. on money, and therefore that the question of the volume of money in a country has very little significance compared with the importance of a good credit system.

Professor Commons.

"But there are two objections to this conclusion. What would be thought of the sanity and the conclusions of a man who should gather statistics only from the meat markets in the land and then should expound the statement that 95 per cent. of all the industry of the country consisted of fresh meat and only 5 per cent. of the country's industry consisted of all other kinds of commodities? The conclusion is no less credible than is the aforesaid statement regarding credits. The statistics are gathered only from enterprises whose sole business almost is dealing in credits. But if you go to the retail merchant he will say 25 per cent. to 75 per cent., and even 100 per cent., of his business is paid for in cash. The farmer uses very few checks and drafts. The millions of day laborers use none at all. Taking the country as a whole, perhaps not 50 per cent. of all transactions are settled by credit instruments, while the cash of the country must be actually transferred in settling the other 50 per cent."

President Andrews (*An Honest Dollar*, p. 26) takes the same position; and says :

"While substitutes for money have been multiplying in certain directions, others have been withdrawn. The truck system of paying factory help is dying out. More significant is that increase in the division of labor, by which many important products, like wagons, harnesses, shoes, and clothing, whose manufacture used to begin and end under the same roof, are now gotten

up by a dozen, more or less, different establishments. The wagon-maker buys his wheels of one man, his bodies of another, his tops of another. Nearly all country shoemakers, for new work, purchase the uppers ready made and the soles all cut from some city firm. Blacksmiths no longer make their nails, rarely even point them, and almost never think of forging a shoe or a bolt. All these things they purchase.

"Two years ago I found a man who had for a decade owned and carried on the chief store in a flourishing New England village ignorant how to draw a check. If this in the East, how slight must be the play of banking methods in the West and South! The gross *per capita* mode of estimating monetary need is fallacious, and I never appeal to it, but it is far more applicable in this country than in England.

"The *per capita* capital surplus, undivided profits, and individual deposits in banking institutions of all kinds was, on January 1, 1887, for the entire United States, \$76.19. For Rhode Island, the highest figure, it was \$304.83; for Massachusetts, next highest, \$207.86; for New York, third highest, \$251.08. For Mississippi it was but \$3.23—the lowest; for Arkansas, \$4.20; for North Carolina, \$5.45; for South Carolina, \$9.61.

"With nations, as with individuals, those best able to get credit use it least. In all the wealthiest countries the proportion of cash payments to total volume of trade is steadily increasing. According to Rae, from 70 to 90 per cent. of the world's business is done on credit. In Germany, Siam, and Canada the proportion is 90 per cent.; in Belgium and China, 80. Credit traffics its feeblest development in Holland; its strongest in Turkey and Yucatan. With progress in economic organization, the sphere of credit becomes less extensive, its operation more intensive and useful. Cash payments, getting the mastery first in wages, in retail trade, and in raw products, spread gradually over other fields, shutting up credit to its most helpful and least dangerous functions. People are everywhere more and more replacing book credit by bills, long credit by short, mercantile credits by banking credits, and banking credits themselves they are making more widely effective and available by specializing the organization of financial institutions to particular branches of industry."

The question of the amount of currency, then, cannot be dodged by the statement that credit fills all gaps. On the other hand, let us now see how great has been the increase in the demand for currency. Mr. W. C. Fisher, in a careful study of the facts of the case (*Appendix to An Honest Dollar*, p. 47), admits an actual increase of circulation, but not in proportion to the increased demand. He says:

"In the period, 1870-1888, there was an increase in the *per capita* circulation outside of the Treasury from \$20.24 to \$22.46; but the increase in the amount of exchanging—that is, in the demand for money—seems to have been much greater. For example, Poor's figures show that the amount of railway freight transportation rose from about 2½ tons in 1868 to 9,2176 tons in 1887; while the Census gives the *per capita* wealth in 1870 as \$783, and in 1880 as \$870. But the large numbers which express the business of America are best understood when reduced to percentages, and I have, therefore, taken the amount of money in the circulation and the amounts of production, consumption, exchange, etc., in 1870, as the bases, and have computed the increase in percentages to the latest years for which data are accessible.

"The standard against which the growth of industry is to be measured in this connection is the rate of increase in the amount of circulating medium; and for this the figures, from 1870, are to 1886, 50 per cent.; to 1887, 70 per cent.; to 1888, 77 per cent. Population to 1888 shows an increase of 50 per cent.; cereal crops, 97 per cent.; pig iron produced, 200 per cent.; bales of cotton, 112 per cent.; postal receipts, notwithstanding two reductions in the charges, 167 per cent.; railway mileage, 235 per cent. From 1870 to 1887 some of the increments are: cotton consumed, 101 per cent.; tea, 106 per cent.; coffee, 117 per cent.; sugar, 88 per cent.; wool, 87 per cent.; tonnage entered and cleared in the foreign trade, 114 per cent.; freight carried on 13 trunk lines, carrying 22 per cent. of total in the United States, 317 per cent.; ton-miles of freight transportation on same lines, 333 per cent.; insurance against fire reported to the New York Department being 80 to 90 per cent. of the whole 203 per cent. To 1886 there was an increase in the coal mined of 225 per cent.; in hay cut,

70 per cent.; in potatoes, 46 per cent.; in tobacco, 37 per cent. Other figures of the same general bearing might be given, but they would only fortify what is already proved by the cumulative evidence of the foregoing—that is, that since 1870 the money worth of this country has increased much more rapidly than has the amount of money in circulation."

Mr. Fisher comes finally to these conclusions:

"I. That the increase of the currency has not at all kept pace with the expansion of industry.

"II. Improvements in the means of communication, and in the facilities for transporting money, the extension of savings institutions, and the rising value of money itself, have all probably had a right tendency to accelerate the circulation; but the total effect of these causes must have been quite inconsiderable.

**Increase not
Rapid
Enough.**

"III. The operations of the clearing houses are presumably a fair index of the use of checks, and seem to show but a very moderate expansion during the period under consideration. The amount of the clearings at New York per head of the population of the country has each year since 1883 been less than in any one of the years between 1863 and 1874, or between 1870 and 1884, and has exceeded by only a little the clearings in the years of depression which intervened between the panic of 1873 and the revival of 1879. It is scarcely safe to draw conclusions from the scanty data of the other clearing houses; but, so far as these go, they point in the same direction. If the amount of deposits against which checks may be drawn be taken as the index of the extent to which they are actually drawn, a slightly greater increase seems probable; but there is nothing to indicate that the use of checks has increased at equal rate with the exchanging of the country. An examination of the conditions under which book accounts fully take the place of money and checks will make it quite clear that the range of this substitute for money not only is not extending, but is rather growing narrower."

Such, then, seems to be the well-substantiated facts, that credit does not replace the use of money to at all the extent popularly claimed, and that it is doing so less rather than more, and that, secondly, the treasurer's figures are not to be implicitly accepted without analysis; while even accepting them, it is plain that the claimed expansion of the currency has not kept pace with the increase of demand, thus making, even on this basis of the treasurer's figures, a virtual contraction of the currency, and on the basis of fairer figures, a criminal contraction which has damaged every debtor and every worker in our land. But this is only one half the question. If, as we have seen, to have an honest dollar it is necessary to have one which will always purchase the same amount of value or total utility of standard commodities, so that the farmer, for example, who borrows the cost of 10 loads of hay will not, in order to repay the same nominal sum, have to pay back 20 loads, let us ask:

How have prices varied in the United States since the war? Notoriously, generally speaking, they have declined; how much, we shall see in a moment. But this is the same as to say that the value of money has appreciated—that is, every dollar will buy more of the average commodities. Consequently, he who lent a dollar soon after the war and receives it back now receives, or even if he does not receive it, by law has a right to more value as measured in commodities than he lent. Let us see how much this is. There are several ways of measuring the facts. One may consider gold the standard, and see how prices have fallen; or one may consider silver the standard, and see how prices have fallen; or one may consider

prices the same, and see how gold and silver have appreciated. In some admirable tables Edward B. Howell, in the *Review of Reviews*

for September, 1893, has presented the facts in the two first ways. We present them here by permission :

CHART I. SHOWING THE FALL IN PRICES, GOLD BEING THE STANDARD.

CHART II. SHOWING THE FALL IN PRICES AND APPRECIATION IN GOLD, SILVER BEING THE STANDARD.

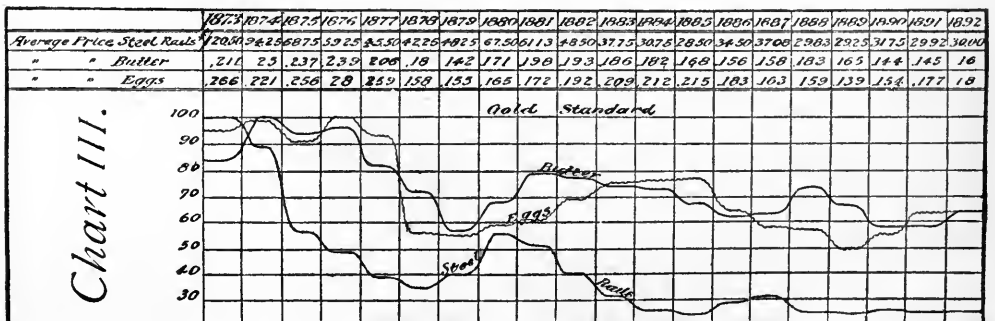

"In these tables, says Mr. Howell, "the statistics for the intrinsic value of the silver dollar as measured by gold are taken from the last report of the Director of the Mint. The 20 leading commodities whose percentages are averaged include cotton, with three or four of its staple fabrics, wool, corn, wheat, wheat flour, mess pork, butter, eggs, leather, anthracite and bituminous coal, etc., such as constitute the chief sources of America's wealth. If more commodities had been included, or different ones, the showing might have been modified somewhat, but not materially, for what is true of the fall of these commodities is true of all."

The statistics for these commodities were taken, Mr. Howell also tells us, from government statistical returns.

Now the question arises whether this fall in prices has been occasioned by improved methods in production, etc., or by the appreciation of money? Mr. Howell answers this, and says :

"An editorial in the June *Century* denies the appreciation of gold, and claims that the fall of prices has been due to improved methods of production and distribution. It is impossible to wholly disprove a statement that is partially true. No doubt improved methods of production have lowered the prices of certain commodities. In most of the commodities named above there have been no materially improved methods of production in the last 20 years. In Chart III, I have compared the range in price of a commodity in which there have been improved methods of production with two others in which there have not. The methods of producing steel rails have been greatly improved in 20 years, and as a result the price has taken a veritable 'header.' Yet butter and eggs have also declined in price, though there have been no improvements made on the ordinary cow and hen as methods of producing them. In other words, improved facilities may in some cases have augmented a fall that has been due to another and more universal cause."

Here is his Chart III :

We see thus plainly that while improved production undoubtedly has lowered the price of many commodities, money has even apart from this appreciated.

But whatever be the *cause* (for a further study of this subject see SILVER ; BIMETALLISM ; CURRENCY), we are here concerned simply with the *fact that money has appreciated*. How much this is the case is well illustrated by President Andrews (*An Honest Dollar*, p. 13) :

"Our national debt on September 1, 1865, was about two and three quarter billions. It could then have been paid off with eighteen million bails of cotton or twenty-five million tons of bar iron. When it had been reduced to a billion and a quarter, thirty million bales of cotton or thirty-two million tons of iron would have been required to pay it. In other words, while a nominal shrinkage of about fifty-five per cent. had taken place in the debt, it had, as measured in either of these two world-staples, actually been enlarged by some 50 per cent. . . . Between 1870 and 1884, the debt of the United States decreased not very far from three quarters of a billion dollars. Yet if we take beef, corn, wheat, oats, pork, coal, cotton, and bar iron together as the standard—assuredly not a bad one—the debt not only did not decrease at all, but actually increased by not less than 50 per cent."

Now, it can be seen what expansion and contraction of the currency means to the producing and debtor class of this country. As with public debts, so with private debts. Measured by what a dollar will buy from 1870-84, every debt increased, according to President Andrews's statement, threefold. Immediately after the war American enterprise filled the West with new farms. The farmers borrowed money, and mortgaged their farms to get stock and "plant." To-day their unpaid debt has increased threefold in value. Contraction in the currency will increase their debt still more. Expansion in currency will reduce their debt to nearer its value when they contracted the debt. Can any one wonder that almost desperately the farmer, mortgaged often beyond all hope of payment, battles desperately, wildly, pathetically for an enlarged circulation, be it of silver, paper, or aught else that seems to promise relief? Is it any wonder, too, that in his desperate condition (see MORTGAGES) he makes mistakes, and is willing to get money, *even of bad quality*, if he can only get quantity? When it is remembered, too, that, according to the best authorities (see BIMETALLISM), it is at least very doubtful if there be gold enough in the world to do the business of the world, is it any wonder that those already burdened under a load of money contraction and falling prices struggle desperately, sometimes almost insanely, for bimetallism or anything which promises deliverance from the further contraction of the currency and the appreciation of gold value by what they consider "the gold conspirators of the world"? For a fuller study of the situation, see CURRENCY ; but here, from the best authorities and principles accepted by all economists, we can see somewhat of the appalling results of monetary contraction in the United States.

We therefore come to consider

IV. PROPOSED REMEDIES.

(a) Choose that standard which varies least, which is gold, say some ; which is silver, answer others. But either vary very much in

value. (See SILVER ; GOLD.) Is there no better way?

(b) Choose both, say the bimetallists. (See BIMETALLISM.) But even this is not sufficiently elastic, and if it were, seems to-day to be impossible. Says Professor Commons (in article already quoted) :

"Both bimetallism and monometallism leave the regulation of the volume of currency to the wasteful, irregular frolics of nature. A truly elastic currency can be obtained only by substituting scientific human design for nature's unconscious lottery.

"But the insuperable obstacle to bimetallism is the impossibility of reaching an international agreement. The United States have invited the nations of Europe to three international conferences, but to-day an agreement is no nearer than 14 years ago, when the first conference was held. Until the last year or two it may have been possible that the United States, with their boundless resources and industry, could have maintained the parity of the two metals without the help of the European nations. But no longer does there remain any doubt. We must face the fact now that the money policy of Europe is dictated by a league of the money-lenders and the army chiefs. The masses of the people are ignorant, apathetic, and powerless. With millions of gold collected into 'war chests,' regardless of cost, with Austria-Hungary suddenly calling for \$200,000,000 of gold, and now at last with India, for centuries (as a Frenchman has said) the historical abyss of silver from which there is no return, with the mints of India ostracizing the white metal at the command of the money princes of England, there is no hope that the United States alone can maintain free silver coinage. Already our gold has been rapidly disappearing and has reached the danger line with a law considerably short of free coinage. Should the greater measure be enacted the rest would follow, and our foreign trade would be reduced to a gambling joust, like that of Mexico."

It has therefore been proposed to

(c) Choose some standard or standards, and increase the quantity by a commission controlled by fixed law, taking it out of the hands of political interests. For this several detailed plans have been presented.

Professor Walras, of Lausanne, would work *a priori*. He judges that the volume of commerce, the volume of money, and the relation between the two can all be so closely figured out and followed that threatened changes in general prices may be forecast and prevented. President Andrews would follow a similar plan, but work *a posteriori*. His method, he says, "would involve (1) the critical, official ascertainment of the course of prices ; (2) the use of some form of subsidiary full legal tender money ; and (3) the injection of a portion of this into circulation, or the withdrawal of a portion therefrom, according as prices had fallen or risen.

"There is, of course, much labor and care involved in determining the course of prices ; but the task can be accomplished, with all sufficient exactness, without excessive difficulty. Plans for a compound standard of value have been numerous. The articles composing them, it is always and justly urged, must be staples, and must be the same in kind, quality, and amount at all the successive listings. There are five conditions besides these on which stress should be laid. One is that the commodities must be taken from each of the two great classes, those subject and those not subject to the law of diminishing return, as far as possible in the proportion which each bears to the total consumption. The second is that those articles must be chosen which are the least subject to accidental and artificial fluctuations, as by customs regu-

lations, peculiarity of seasons, weather, and the like. Thus Soetbeer is doubtless right in thinking prices in Hamburg, which till lately has been a wholly free market, somewhat more normal than those of London even. The third is that the greater the number of staples the better, provided the just indicated requirements be adhered to. The fourth is that, as a rule, prices are to be registered in all the major markets of the country or countries whose prices are in question. In not a few cases, as wheat and standard silver, London prices would serve as well for other countries as for Great Britain. For many staples trustworthy price records are now kept, as by the London *Economist* and *Gazette*. For others, new or more accurate records would have to be instituted. The fifth special condition is that of quantity coefficients—an arrangement by which the figures for each commodity are made to enter into the grand total a number of times in proportion to the quantity of it consumed.

"At intervals, now, whether directly or index-numberwise, as may be found intrinsically the more correct as well as the less subject to mistakes of calculation, the entire price-list of the articles determined on is to be added up. The geometrical, the arithmetical, or the harmonic mean may be sought. If the amount at any addition is greater than at the last, general prices have risen; money has grown cheaper, has lost in purchasing power; too much of it is in circulation; and some must be withdrawn.

"If, on the contrary, the amount is less than at the last summation, prices have fallen; money has grown dearer, has gained in value; too little of it is in circulation, and more must be set free or coined, to redress the balance. In a word, inflate or contract, rarefy or condense, so as to keep the footing of your great price-list perpetually the same.

"The universally conceded equity of a composite value standard would in this way be incorporated in the monetary system itself, and would spread to all the exchange transactions of the nation. The very knowledge of an existing purpose thus to regulate would do much to regulate."

The Hon. Henry Winn, of Massachusetts, has formulated a plan not dissimilar. In the speech quoted above he says:

"It seems to me that the remedy lies in a currency of legal tender treasury notes, not redeemable at any fixed ratio in coin, but receivable for at taxes and public dues, and kept as nearly as possible, by expansion or contraction of their volume, at a fixed par in value by comparison of the average market price, in such currency, of a specified number of commodities selected as affording the best barometer of values. The value

ratio of the dollar to this fixed par should be declared at stated periods by a commission of experts, who might be authorized to reject, for declared cause, any commodity of which the price should appear abnormal or forced, replacing it from a list of authorized substitutes. The basis of their action would be so completely public that fraud would not occur. All time and overdue debts should by law be payable by such an amount of this currency as would give to the creditor value equivalent to value given by him, as determined by the ratio for the period when the debt was contracted compared with the ratio at the time of payment, with his interest, and no more.

"In ordinary transactions and account current the ratio or variation would not enter or be thought of, and the only inconvenience would be a computation at

settlement of time obligations, involving perhaps half the usual labor required to compute interest.

"Thus currency at 1.10 would indicate that it would buy one tenth more of the commodities than when it was at par, and at 90 it would buy one tenth less. So a note for \$1000 given when currency is at 90 would be paid at \$818.18 when currency is 110; and given at 110 would be paid at \$122.22 with currency at 90."

Finally Professor Commons has presented a plan, perhaps the wisest in the present situation. It is a combination of President Andrews's plan with one proposed by Secretary Windom in 1889. Says Professor Commons (*Annals of the American Academy*, September, 1893):

"In the April number of *The Forum* Mr. José F. de Navarro proposes, instead of the present system of silver certificates and treasury notes redeemable in silver dollars, to substitute a system of bullion notes redeemable in silver bullion at the gold price of silver on the day of payment. This is essentially the plan submitted to Congress in 1889 by Secretary Windom, who proposed to restrict the issue of these bullion notes to the yearly commercial value of the product of the American mines. This would have resulted in an annual increase of the currency of about \$55,000,000 (\$57,600,040 in 1891). All the advantages of the plan as claimed by Mr. de Navarro may be readily conceded. It would check at once the scare about the loss of our gold. In fact, with such a system of currency, the United States could dispense with gold altogether. This is a contingency, however, which neither Secretary Windom nor Mr. de Navarro seems to have considered safe or allowable. Yet further consideration will show that, having adopted the system of bullion notes, every dollar of gold now on hand might be exported to Europe, and every new ounce from the mines might follow it, yet every dollar of American currency would be as good as a gold dollar. Should all the gold leave the country in this way, cablegram reports from London every day would give the gold price of silver, just as the Director of the Mint to-day receives prices to guide him in the purchase of bullion under the act of 1890. Every bullion note presented to the Treasury would be redeemed in silver bullion at the world's gold price of silver on that day, and would, therefore, be equal to a redemption in gold on the markets of the world.

"If these principles be true, may not the United States go further and adopt a scientifically elastic system of currency, based on bullion notes?"

Professor Commons then goes on to state the plans of Professor Walras and President Andrews, and objects to them on the ground that they would make the subsidiary money mere token money, which, when prices were rising, could not be contracted except by issuing bonds redeemable in silver certificates, since it could not sell silver for the certificates, and when prices were falling could only be expanded by an injection of depreciated coins.

"But," says Professor Commons, "these objections would not hold if the subsidiary money were bullion notes redeemable in silver bullion at the current gold price of silver. With such an amendment, the scheme of President Andrews could be carried out with eminent success by the United States alone. We could become the great regulator of world-prices, and not with great loss, such as France incurred when she played that role under simple bimetallism, but with unexampled profit. Our six hundred millions of gold would go abroad in just the quantities we desired and keep up Europe's prices, while we would be doing business on a gold basis without need of the gold. The monetary commission, if prices were falling, would purchase silver bullion at its market value at any figure below \$1.29 per ounce, and legal-tender certificates would be issued in payment thereof, in such quantities as were necessary to keep up prices. Then, again, if prices were rising above the standard, the commission could sell silver bullion at its market value, and could lock up the certificates received therefor, thus contracting the currency without the issue of bonds. With the expansion of the country, however, it is likely that the purchase of bullion rather than its sale would be the normal operation.

"It may be objected that quantity of money is not

the only factor influencing the rise and fall of prices, but that inflation and collapse of credit have the same effect. This is undoubtedly true. But credit depends largely on the prospects of the money-supply. The knowledge that a commission of experts is ready to contract the currency will prevent undue and over-inflated credits, and the knowledge of power to expand the currency will give infinite confidence and power of resistance in times of panic and depression.

"The possible objection that the stock of bullion in the vaults of the Government may become depreciated and the Government may lose through corners or otherwise, when it sells bullion, need have little weight. In the first place, there will be more buying than selling, which would stiffen the price of silver. And, secondly, tho the bullion value should fall, the Government would be as safe as it is at present with \$100,000,000 gold to redeem \$340,000,000 greenbacks and some \$400,000,000 of silver certificates. Let the United States adopt this plan, and we should be independent of international monetary conferences and bimetallic treaties. An international money would be created which the nations of Europe would soon be driven to imitate."

Such are the main ways proposed for the meeting of the evil. For still other plans for an elastic paper currency, see PAPER MONEY. For references, see MONEY and BIMETALLISM. For the latest facts in regard to the circulation, see SILVER.

Revised by PROF. J. R. COMMONS.

CONTRACT LABOR.—When a national, municipal, county, or other government desires to erect a building or undertake any other work, like printing, supplying the army, etc., the custom has grown of giving out the work to be done by some contractor or contractors, who usually sign a contract with the government to do the work or furnish the required supplies for a certain sum, taking the responsibility of purchasing the material, hiring the workmen, and concluding the whole work. Even private persons and corporations usually give to contractors the job of doing for them all work not wholly in the lines of their own industry. Business, therefore, done on contract forms a very large proportion, particularly of the building, constructing, and furnishing trades. This method of business has grown up mainly for two reasons: Firstly—and this reason applies particularly to private corporations and individuals—because it is usually the easiest method. An individual or a corporation, and to a less extent government, has not often either the time or the ability to conduct an operation apart from his, her, or its own line of industry, and it is therefore much easier and sometimes the only possible way to give the whole job to some contractor, whose exact business it is to do the kind of work that may be required, and leaving to him all responsibility for details, to pay him a lump sum for the completed work, usually with certain specified requirements and by a specified time. Secondly, it is usually claimed—and this reason is applied particularly to governments—that it is cheaper to let out the work

might be obviated, especially on the part of governments that are always having such works performed, by hiring paid specialists not to take a contract for the work, but to conduct it for the government itself; but this, it is usually said, is expensive. It is a common opinion in business and public circles that public work is never as cheaply done as private work. Public work, carried out by paid officials and employees, it is said, is always comparatively expensive, because it is no one person's interest to see that the work is cheaply done. The only party that suffers if it is not cheaply done is the general public, and the public often knows little if anything about it, and when it does know is often unable to speedily and readily act in the matter. Consequently, it is said, government work is usually carried out by corrupt officials and lazy, inefficient employees. Contract labor is cheaper, it is argued, because rival contractors will bid against each other to do a job as cheaply as possible in order to get the job, and will then see for the advantage of their own pockets that their men do work cheaply. To insure this, legislation, and often the special legislation authorizing the undertaking, requires that the work be bidden for in the open market, and the job be given to the contractor agreeing to do it for the lowest figure. Therefore exact specifications of what is wanted are usually advertised by the government, and sealed bids from various contractors are received for doing the work, and at a certain time the bids are opened and the contract awarded to the contractor offering the best terms. This, until recently at least, has been almost universally regarded as the best way of getting work done.

than for the government or individual to do it for himself or itself. This second reason naturally springs in part from the first reason. What we know little about we cannot do cheaply. A contractor whose special business it is to undertake a work can naturally do it more cheaply. This, it is true,

But three main difficulties have resulted from this system. In the first place, it has developed some of the greatest political scandals of modern times. It being, of course, for the interest of the contractor to get all he can from the government for doing the job, it has repeatedly happened that contractors in some way bribe the administration or the officials in charge of the works to award them the job, even when they do not offer the lowest price. So frequently does this happen, that public officials expect, as a matter of course, to be bought in this way, and a job is created simply to afford a chance to the officials to sell the contract. Sometimes contractors seem all but compelled to bribe their way to receiving a contract. Not infrequently officials will form bogus companies of their own, and award a contract to themselves at exorbitant rates, and then secretly sublet the contract to some company or contractor, pocketing themselves the enormous difference. "Jobs" of this kind, especially in municipal governments, have at times in America been almost the rule. (See JOBS.) Secondly, it being the interest of the contractor not only to get a high price for his work, but having gotten a high price, to perform it as cheaply as possible, he often defrauds the public, and sometimes with the connivance of public officials, by furnishing anything but the specified quality of material and the specified quality of work.

**Arguments
against.**

**Arguments
for.**

The rotten jobs that have been thus put upon the people disgrace almost all American cities, and exist wherever the contract system is found. Thirdly, it being the interest of the contractor to pay low wages to his men, the contract system has often become synonymous with the employment of the lowest forms of imported labor, to the exclusion of the more educated workmen of the country. Roads are built, dwellings, etc., put up in America by contractors who employ imported Italian and Hungarian labor, while American workmen go idle for lack of employment. This not unnaturally has greatly incensed trade-unionists, and they continually urge, and occasionally succeed in compelling municipal governments to give the preference to workmen resident in the city; but more and more are they agitating for the abolition of the whole contract system, which has proved itself fruitful of such corruption, and is built often upon the low wages of working men. They argue that it is the first duty of a government to be just to its own citizens, and that it has no right to leave the management of public works to irresponsible contractors. They would have government employ its own workmen at fair prices, for fair hours, and avoid the costs of paying middlemen and contractors. They claim, too, that this will really give the public both better and cheaper work. They do not, of course, claim that all corruption will disappear, but that work conducted by public officials can be more easily investigated and watched than work given out to private contractors. Such are the general arguments on both sides. We close this article by giving a statement of a representative believer in the contract system and a representative believer in the public doing its own work. For the contract system the Hon. Nathan Matthews, Jr., the Mayor of Boston, said in his valedictory address, January 5, 1895:

"One of the chief difficulties in municipal government under democratic institutions is the treatment of the labor problem in its various aspects. The relations between the municipal corporation and its employees engaged in manual labor are everywhere the cause of unceasing agitation and discussion; and this is particularly the case in Boston, where from the earliest times a larger proportion of the public work has been done by day labor than in the other large cities of the country. The collection of garbage, at first let out to contractors, was intrusted to a department of the city government to be handled directly by its employees, as early as 1824; and in the same year a street-cleaning service was inaugurated upon the day-labor plan. The lighting of the public lamps, which prior to 1868 had been done by the gas companies or other contractors, was at various times between that year and 1870 handed over to the lamp department, and has since been attended to by the employees of that department. Work upon the streets was done very largely by day labor as early as 1850; sewers have been built by day labor from an early period; the laying of pipes for our waterworks has almost always been done by the day; since 1865 the construction of the great basins has frequently been attempted by day labor; and a large part of the work of park constructions since 1882 has been done by the day.

"The present practice is to do all the work of maintenance, repairing, jobbing, pipe-laying, and all matters the proper execution of which is a question of opinion, and therefore difficult to secure through written specifications, by day labor employed directly by the city departments, and to let all works of large construction out by contract.

"The day-labor system, even if excluded entirely from works of large construction, costs the city very much more than contract work, as, owing to the higher rate of wages paid, the smaller number of

hours, and the large number of holidays and half-holidays without loss of pay, the city pays about 60 per cent. more than the market rate of wages.* A further loss is experienced through the necessity of furnishing, so far as practicable, permanent employ- **Day Labor.** ment throughout the year, and also by the continued employment of men who have grown old in the service of the city.

"On the other hand, a good deal of the city's work could not be done by contract without constant complaints from the citizens that it was not properly done. This applies to the collection of garbage, the cleaning of streets, the lighting of lamps, and other work of the sort, the proper execution of which is in the nature of things a matter of opinion, and therefore incapable of accurate specification in a written contract. In the next place, work in the nature of jobbing—of which there is a great deal in the street department—probably costs no more under this system than if let out by contract, for the reason that the profits of the middleman in small jobs are necessarily large. Then there is a class of work difficult of inspection, such as the laying of water-pipes, which it is for the interest of the city to have done by day labor, even if it costs more, in order that the city authorities may be certain that it is well done.

"Notwithstanding all that can be said against the execution of public works by day labor, I am satisfied that it is on the whole for the advantage of the city that work of the character mentioned should be done in this way; and as to the high rate of wages, shorter hours of work, and other privileges which swell the cost, it may be said that the wages paid to the city laborers have not been increased since 1882;† that the hours of labor are regulated by statute; and that if the city is to employ day labor at all, it has been found practically necessary that the laborers should receive high wages, permanent employment so far as practicable, and generally a more liberal treatment than in private work. Whether city laborers work as faithfully as those employed by contractors depends on circumstances, principally on the discipline of the department and the energy of its foremen.

"Passing now to the consideration of works of construction, we find wholly different conditions. Here the cost of the day-labor system is very much greater than contract work, and the results are in no respect more satisfactory.

"While there are opportunities for collusion and corruption in the contract system, still these opportunities can be, and so far as my experience goes, are avoided with comparative ease. Contracts for work of this character can be so drawn as to permit of accurate inspection, and with upright and watchful heads of departments there is no reason why public work of this sort cannot be carried on fully as cheaply and quickly as private work.

"I have been at some pains to secure accurate comparisons of the cost of works of large construction done by day labor and by contract, and the following instances are given by way of illustration: At Lake Cochituate, in 1887, about 50,000 cubic feet of shallow flowage work was done by day labor, at a cost of \$28,877.16; while the following year about 57,000 cubic yards of similar work was done by contract for \$16,202.25. Stripping 54,000 cubic yards of loam from the bottom of Basin 6 cost by day labor 71 cents per cubic yard; while the average of five sections let out by contract, involving the removal of about 400,000 cubic yards, cost about 40½ cents a cubic yard. Rubble masonry was built on Basin 6 by day labor at a cost of \$12.50 per cubic yard, and by contract for \$7.50 per cubic yard. The work on Basin No. 5 (that now under construction, estimated to cost \$2,500,000 for land and construction) is being done by contract; while the greater part of the work at Basin No. 6 was done by day labor; and the following table shows a comparison of the results obtained.‡

* The cost in the street department alone of holidays and half-holidays amounts to nearly \$75,000 per annum. A city laborer (unskilled) receives about 24 cents per hour of actual work, while the contractors pay about 15 cents.

† When they were fixed by vote of the city council at not less than \$2 per day.

‡ The city engineer, from whom these figures are obtained, makes the following explanation:

In the item of 496,007 cubic yards of stripping is included one section of 90,870 cubic yards, which was very difficult. Excluding that section, the average cost of stripping 405,197 cubic yards was 35½ cents per

	DAM No. 5.	DAM NO. 6.	
	Contract.	Contract.	City.
Stripping of basin and dam	0.24	0.57
Sodding embankment.....	0.28	0.90
Concrete core-wall.....	4.70	6.61
Plastering Portland cement	0.67	0.99
Delivering gravel on embankment.....	0.206 (est.)	0.206
Spreading and rolling.....	0.119 (est.)	0.226
Stripping 496,207 cubic yards.....	0.405	0.64
Stripping 110,232 cubic yards.....

"The plan now being pressed by certain labor organizations (not composed of city employees) for the construction of public buildings by day labor employed directly by the city is too preposterous for discussion. The city has no opportunity to give constant employment to the skilled labor required in building operations, and would, therefore, be unable to secure the best workmen; it has no plant; the administration of such work would greatly enlarge the scope of political patronage; the cost may be safely set down as two or three times that of the present system; and all the advantages to be gained from competition under our present admirable contract law would be lost.

"Between the demands of the taxpayer for the execution of all public works by contract, and the demands of the labor organizations that all public works should be done by the day, I believe that the safe, reasonable, and prudent course to follow in the public interest is the system now and for some time past in operation. According to this, all work of large construction is done by contract, through competition, except, perhaps, in certain special cases of peculiar difficulty; while jobbing, maintenance, repairs, and other work of the kind, including all that cannot be accurately specified and inspected, is done by day labor employed directly by the city departments upon liberal terms, in respect to wages, hours, holidays, and length of employment."

To this it may be said that even if contract labor be cheaper, it is at least questionable if a city should seek cheapness by importing or encouraging the importation of cheap, ignorant laborers, who are often a danger and a burden to the community, and who prevent its own citizens from earning a fair living; but it is even argued that experience shows that contract labor is not cheaper. Mr. Sydney Webb, in a paper read before the Economic Section of the British Association for the Advancement of Science in 1894, relates the experience of the London Council. He says:

"We come to an altogether different range of criticism when we consider the council's determination to dispense, wherever possible, with the contractor, and execute its works by engaging a staff of workmen under the supervision of its own salaried officers.

cubic yard. The city work necessarily costs more than that done by contract for the reason that the city pays in the country \$2 for nine hours' work, gives one half-day per week during four months, all holidays, and two days for voting. The men work from eight to nine months per year. This makes the price paid for one hour of actual work about 24 cents, while the contractor pays in ordinary years, in the country, 15 cents per hour.

The division of cost of building the dams is about as follows: Labor, 6 per cent.; teaming, 13 per cent.; tools, etc., 20 per cent.; and on this basis the city must pay 1.42 times as much as the contractor for the same effort. For stripping, the division of cost would be for labor, 75 per cent.; teaming, 20 per cent.; tools, etc., 5 per cent.; and the city must pay 1.49 times as much as the contractor.

This has been fiercely attacked as being palpably and obviously opposed to political economy and business experience. It is worth while to place on record the facts. The first case is that of watering and cleaning the bridges over the Thames, a service which the Metropolitan Board of Works let out to a contractor. The new council perversely went into calculations which led the members to believe that the contractor was making a very good thing out of the job, and finally to decide upon engaging labor direct. There have now been over three years' experience of the new system, with the result that, whereas the contractor charged 4s. 7½d. to 4s. 10½d. per square yard, the work is now done at an average cost of 3s. 2d. a square yard, everything included.

"In July, 1892, it was necessary to do the annual cleaning and repairing of the council's offices. The architect's estimate for the work as executed was £740. Instead of giving this work to a contractor, the architect was asked to engage a foreman and artisans, and have it done under his own supervision. The result of the experiment was that the total cost was £686, an apparent saving of £54.

"This, however, was merely a matter of hiring labor, no constructive work being involved. It is interesting to trace the stages by which the council was driven, by force of circumstances, to its present position of builder. The first piece of actual building executed by the council was a schoolhouse at Crossness. The architect's estimate was £1800, and tenders were invited in due course. The lowest tender proved to be £2300. After considerable

Remarkable Results.

hesitation the Main Drainage Committee resolved to try to save this large excess over the estimate, and set to work to do the job under its own officers. Certain items which had been put down at £112 were omitted, reducing the estimate to £1688, and the lowest tender to £2188. The actual cost proved to be £1652 only, a saving of £536. But the case which finally convinced three out of every four members of the council of the desirability of executing their own works was the York Road sewer. The engineer estimated the cost at £7000, and tenders were invited in the usual manner. Only two were sent in, one for £11,588, and the other for £11,668. The council determined to do the work itself, with the result that a net saving of £4,177 was made.

"This remarkable result naturally created a sensation among the contracting world, and attempts were made to impugn the engineer's figures. In his crushing reply he pointed out that the contractors had reckoned out their tenders at absurdly high prices in nearly every detail, charging, for instance, 60s. and 70s. per cubic yard for brickwork and cement, whereas the work was done at 30s. It is clear from the particulars given, and from facts notorious at the time, that an agreement had been come to by the contractors not to compete with one another for this job, in order to induce the council to abandon its fair wages clause. The council preferred to abandon the contractor.

"The outcome was the establishment, in the spring of 1893, of a Works Committee, to execute works required by the other committees in precisely the same manner as a contractor. The Works Committee has an entirely distinct staff, and keeps its own separate accounts. The committee requiring any work prepares its own estimate, as if tenders were going to be invited, and the Works Committee is asked whether it is prepared to undertake the work upon that estimate. Up to the present date 16 separate works, varying in amount from £100 to £4004, have been completed, and the accounts settled and checked by the comptroller. The result shows an aggregate net saving of £2420, or over 8 per cent.

"Now, it is obvious that, incomplete as statistics necessarily are, and difficult as it must always be to decide a question of policy upon mere statistical results, the figures, as far as they go, afford no assistance to those who denounce the council's action, and are distinctly encouraging to its progressive members. No sound induction on such a matter can, however, be made upon mere statements of profit and loss, extending, too, over a very brief period.

"When we thus find even the county councils in rural districts giving up the contractor, it ceases to be surprising that the town council of Manchester, in the city of Cobden and Bright, now manufactures its own basins, or even that the ultra-conservative commissioners of sewers of the city of London actually set the county council an example by manufacturing their own carts. The superiority of direct municipal employment, under salaried supervision, to the system of letting out works to contractors has, in fact, been slow-

ly borne in on the best municipal authorities all over the country by their own administrative experience, quite irrespective of social or political theories."

Comparing the present cooperative system in New Zealand with the former contract system, the Under Secretary for Public Works in that colony says: "The contract system had many disadvantages. It gave rise to a class of middlemen, in the shape of contractors, who often made large profits out of their undertakings. Under this cooperative system works are carried out for their actual value—no more and no less. . . . Work also is better done under the cooperative than under the contract system." See NEW ZEALAND AND SOCIAL REFORM.

CONVICT LABOR.—It is now almost universally conceded that convicts of all kinds should as a rule be made to work at some useful form of labor during their imprisonment (see PENOLOGY); but the important problem arises how convicts may be employed at useful work without diminishing the demand for the labor of honest workmen outside of penal institutions. The manufacture of commodities by the enforced labor of convicts, who are paid nothing, enables prison authorities, if they are allowed to do so, to sell these commodities at prices with which firms employing paid laborers cannot possibly compete, and so tends to lower the wages of honest laborers by taking the market from the employing firms. Naturally this condition of things is bitterly resented by labor organizations, who see their livelihood taken from them. That it is not an unreasonable feeling will be seen by the facts stated in this article. That it is not a small matter can be seen by the number of convicts in the United States. In 1886 there were no less than 45,277 convicts in the United States engaged in productive labor (*Second Annual Report of the Commissioner of Labor*, p. 51). Between 1880 and 1890 our prison population had increased 45 per cent. (Statistics of the Tenth Census and Bulletin 71, 72, and 95 of the Eleventh Census.) Yet the community, in its desire to reduce taxes, by making the convicts support themselves, and also to benefit the convicts themselves by teaching them a trade, has repeatedly allowed convict labor to thus injure honest labor. Even when the produce of convict labor is not sold in competition with the product of honest labor, but simply made to produce the necessities of the prisoners themselves—*i.e.*, making their own clothing, prison buildings, etc., it still makes the convict do work which, if not done by convicts, would have to be given to outside labor, and so increase the demand for their labor, and thus tend to raise their wages. On the other hand, to keep convicts in idleness is physically inhuman to the convicts and not for the good of

the community, since a convict trained to idleness, when he is discharged is almost the worst foe a community can have. The results of training convicts to work, as is done at Elmira (*g.v.*), are so markedly beneficial, that it would seem criminal to prevent such results. Nor is the problem to be solved by teaching the convicts to labor at useless tasks or in producing commodities which are to be destroyed. This is a waste of labor that no wise economy can seriously advocate. The problem, therefore, becomes very intricate, and is the only problem we shall consider under this head. For the different ways in which, for the convict's own good or reformation, it is wise to have them labor, see PENOLOGY; ELMIRA REFORMATORY, etc. We ask here simply how can convicts be made to labor without affecting the interests of honest laborers. It is, of course, to be remembered that this problem only arises under a system of society where men can only get a living by doing all the work they can get. No man cares to work at long hours of hard labor for the sake of working. The modern laborer only looks upon work as a privilege, because it is his only way of living. Under a socialistic system, when all production was for the community, to be divided in some way equitably among the citizens, the more that was produced the more each citizen would get, and the honest laborer, therefore, would be delighted to have the convict work for him. The convict labor problem, therefore, belongs solely to the wage system. Under this system, however, it is a difficult one. Undoubtedly the general solution of it lies in setting the convict to produce that which, if he did not, would not be produced; but how to reach this end is the question. The problem is of such importance and of such difficulty that Congress in 1886 directed the United States Commissioner of Labor to especially investigate and report upon the problem. It is this report that we condense here, considering:

The Problem Stated.

I. The extent to which convict labor competes with honest labor.

II. The best way of employing convicts without injuring the interests of outside labor.

The report (*Second Annual Report of the Commissioner of Labor*, p. 51) gives for three classes of penal institutions—*viz.*, institutions of severe penalties, of moderate penalties, and institutions mainly reformatory—the following summary of convicts engaged in productive work at the close of the year 1886 in the United States:

CLASS.	EMPLOYED IN PRODUCTIVE LABOR.			Engaged in Prison Duties.	Idle and Sick.	Aggregate.
	Male.	Female.	Total.			
I.....	32,625	1,036	33,661	8,146	2,705	44,512
II.....	5,407	452	5,859	3,205	775	9,839
III.....	4,767	990	5,757	3,749	492	9,998
Total.....	42,799	2,478	45,277	15,100	3,972	64,349

The following shows the industries in which convicts were employed and the amount of free labor displaced:

INDUSTRIES.	Convicts.	Free Laborers Required for the Same Work.	Approximate or True Value of Goods Made or Work Done.
Agricultural implements	651	529	\$664,000
Barrels, etc.	607	528	834,093
Boots and shoes	7,609	5,378	10,100,279
Bricks	861	754	286,787
Brooms, brushes, etc.	2,123	1,545	834,955
Carpeting	242	163	95,497
Carriages and wagons	1,376	1,155	1,989,790
Clothing	5,591	3,645	2,199,634
Farming, gardening, etc.	3,569	3,817	762,313
Furniture	3,446	2,435	1,280,006
Harnesses and saddlery	1,455	1,933	1,374,494
Iron goods	1,195	997	1,159,097
Lumber	228	252	63,800
Mining	3,273	3,228	1,666,075
Public ways	3,089	3,088	1,046,779
Public works	611	631	242,547
Stone	4,876	3,160	1,375,202
Stoves, hollow ware, etc.	1,845	1,277	1,254,125
Tobacco	763	564	462,499
Wooden goods	368	205	338,431
Miscellaneous	1,499	1,150	752,631
Total	45,277	35,534	28,753,999

The report says of these tables: "By this summary it is seen that the total value of goods made and work done by productive labor in the penal institutions of the whole country is \$28,753,999.13. It took 45,277 convicts one year to produce this total value. It would have taken 35,534 free laborers to have produced the same quantity of goods in the same time; or, in other words, a free laborer is equal to 1.27 convict, or, to reverse the statement, one convict is equal to .78 of a free laborer.

"The State producing the largest amount of convict-made goods is New York, the value there being \$6,236,320.08. The next State in rank is Illinois, producing \$3,284,267.50 worth of convict-made goods. Indiana comes next, with a product of the value of \$1,579,901.37; while Ohio stands next in line, with a product of the value of \$1,368,122.51; then Missouri, \$1,342,020.07; then Pennsylvania, \$1,317,265.85. Kansas ranks next, with a product worth \$1,279,575.77. Tennessee comes after Kansas, with only \$1,142,000; then Michigan, \$1,087,735.62, and, last of the States producing over \$1,000,000 worth, New Jersey, \$1,019,608.32. Each of the other States and Territories drops below the million-dollar point, Dakota coming at the bottom of the list, with a product of \$11,577.36. It is interesting to examine these values by industries. Boots and shoes lead, the product being \$10,100,279.61, or 35.13 per cent. of the whole product of the penal institutions of the country, \$28,753,999.13; the next largest item being the manufacture of clothing, which is \$2,199,634.25, while carriages and wagons are manufactured to the value of \$1,989,790. In all other industries the product is less than \$2,000,000, the smallest being lumber, to the value of \$63,800. These values are for the year covered by the investigation.

"In regard to the competition with the industries of the whole country, a few figures will suffice: The total manufactured products of the United States, according to the tenth census, amounted to \$5,359,579,191. The total product of all the penal institutions for the year covered by this investigation amounted to \$28,753,999, which is $\frac{1}{187}$ of 1 per cent. of the value of the total products of the industries of the country. To produce the products of the industries of the whole country in 1880, there were paid in wages \$947,953,795, or \$1 in wages to \$5.66 in product. The wages paid by contractors and lessees to States and counties for the labor of convicts, from which resulted a product of the value of \$28,753,999, was \$3,512,970, or \$1 in convict labor wages to \$8.19 of product of convict labor."

In its final summary from these facts the report says (p. 372):

"It is perfectly evident, from information drawn from the tables, that the competition arising from the employment of convicts, so far as the whole country is concerned, would not of itself constitute a question worthy of serious discussion. The product of the prisons is but $\frac{1}{187}$ of 1 per cent. of the total mechanical products of the country. The whole prison population of those institutions in which productive labor is carried on is but 1 in 1000 of the population of the country, and those engaged in convict productive labor but 1 in 300 of those engaged in free mechanical labor. These facts, however, do not invalidate the claim that locally and in certain industries the competition may be serious and of such proportions as to claim the most earnest attention of legislatures. It is firmly established by all the testimony adduced in this report that such is the fact. Working men, individually, everywhere, and collectively through their organizations; manufacturers, individually, and collectively through association; penologists, commissioners, and legislators, both State and Federal, have arrived at this conclusion."

Concerning the different ways in which convicts are employed in production and the way in which they should be employed, so as not to compete with honest labor, it must be remembered that there are in the United States several different systems of convict labor more or less in vogue. There is (1) the *contract system*, under which a contractor engages to employ a certain number of convicts at a certain price per day, the convicts to be employed as a general thing within the prison walls, the State usually furnishing power and machinery. This system was (in 1886) the most prevalent. (2) The *piece-price system*. Under this system the contractor has nothing to do with the convicts; he simply furnishes the prison officers with material, and the officers return the completed work made by the convicts, and the Government receives a fixed price for the work. (3) The *public account system*, according to which the prisoners produce under State management, the produce is sold, and all the profits go to the State for the general good of the community. (4) The *lease system*, whereby the State leases its convicts to a lessee or contractor for a round sum, the lessee taking the convicts, managing them, guarding them, and working them for a profit. The number of convicts employed under these various systems in 1886 and the value of the goods they produced were as follows:

Various Systems.

SYSTEM.	Convicts.	Free Laborers Replaced.	Value.
Public account system.	14,827	10,571	\$4,086,637.87
Contract system	15,670	11,443	18,096,245.74
Piece-price system	5,676	3,986	2,379,180.52
Lease system	9,104	9,534	4,191,935.00
Total	45,277	35,534	\$28,753,999.13

We now come to the definite question how convicts can be best employed with the least minimum of injury to outside labor. On this the report says in substance, first, that in some way the convict must be made to labor. To abolish convict labor would either make the convicts insane, or if they escaped this fate, have them go from the prison more demoralized and vicious than ever, to demoralize and render vicious those with whom they came in contact. (See PENOLOGY.) The report then considers various propositions that have been made for meeting the difficulty.

1. The establishment of a penal colony. This, says the report, "is often advocated as an effective plan for removing criminals from society, and for supporting them in such a way that no competition whatever could arise from their being employed in productive labor. The suggestion is predicated upon a

constitutional amendment, to be adopted, of course, by the States, giving to the Federal Congress power to regulate police matters. This suggestion, therefore, cannot be entertained as a practical plan, for it is not reasonable to suppose that the separate States of the Union will take the course necessary for its adoption, and the States as individuals cannot adopt any such plan,

because of the small proportions of the prison population of each State. The penal colony plan has been abandoned by some nations that had adopted it. (See PENOLOGY, section *England*.) Moreover, it is not reasonable to suppose that the moral sentiment of the nation will ever permit the herding of criminals in any section of the land, whether in Alaska or on any of the islands within the jurisdiction of the United States; for the establishment of a penal colony would entail upon a single community all the evil results now seen to accrue from hereditary taint. Neither the prison reformer nor the producer, whether employer or employed, can afford to increase the opportunities for perpetuating the criminal classes.

"2. *The employment of prisoners upon public works and ways.*—The adoption of this plan would not avoid competition in labor, but it would completely remove any real or supposed competition in prices—that is, it would not affect the products of manufactures.

"This proposition is warmly advocated both by manufacturers and by working men. It is plausible and somewhat seductive. It removes the actual competition

from one realm to another. By industrial labor in the prisons the contractor competes with products of industries in price and sale. The manufacturer has his goods to sell, and his operatives their labor; and both desire to keep prices up. In transferring prison labor

to public works the State would not compete with the price of artisans' or laborers' work, but with the work itself. The brick and stone-masons, the carpenters and painters, the hodcarriers and tenders, would not find the price of their labor affected to any material extent, but would find the market for that labor occupied to the extent of the works in process of construction.

"It has been suggested that the State might engage in some work that would not be performed unless by convicts, such as macadamizing the roads of the whole State. This would necessitate one of two things—either the preparation of stone at the prisons, involving the transportation to the prison from the source of supply and from the prison to the place for use, or the mobilization of the convicts at the points not only of supply, but of consumption, involving a heavy expense for guard duty and confinement."

Such work would be costly work to the State. This is, perhaps, of no particular consequence, as the convicts must be supported in some way, but at best the plan offers a mere palliative, shifting the burden from skilled to unskilled labor, and would result in aggravating many of the evils which grow out of the employment of convicts. It would seem fairer to distribute the work of the convicts among different trades than to concentrate all their work upon public improvements, and thus compete mainly with one form of labor alone.

"3. *The employment of convicts in manufacturing goods for Government.*—If our State governments supported large bodies of troops and the Federal Government had a large standing army the plan might have some force in it, altho in some European countries, where the consumption of goods of the coarser grades, such as shoes and army clothing, camp equipage, harnesses, etc., is very large, the plan has not been made to work very successfully, on account of the objections of army officers to the manufacture in prisons of the goods they require for the equipment of their forces, the objections arising, not only on account of the quality and make of the goods, but on account of the impracticability of massing a force in any way so as to supply goods upon emergencies. The experience of these countries, however, is worth but little in the United States, for the same conditions do not exist. If each State should supply all its wants, so far as the kinds of goods that would be the employment of but a very small fraction of the convicts of the State. In Illinois this amount of employment could have been utilized last year to the extent of less than \$50,000, and this is a fair specimen of the demands of other States. It is urged, however, that the United States Government requires supplies sufficient to warrant the constant, or nearly constant, employment of the convicts

of the different States under contracts which might be made by the heads of departments requiring the goods. An examination of these wants shows that the entire expenditures of all the executive departments of the United States Government for furniture, clothing, mail-bags, harnesses, wagons, infantry, cavalry, and artillery equipments, clothing for the Indian service, etc., and for such other things as are now made in the different prisons of the various States, for the fiscal year ending June 30, 1886, amounted to a sum little less than \$4,000,000, while the total product of the prisons of the country amounted for that year substantially to \$29,000,000. This answers the suggestion completely. If it could be adopted, however, competition in the wages of labor and in the price of goods would be avoided, altho the individual concerns now manufacturing the goods used by the Government would lose that much trade, which would also result in the loss of so much labor."

"4. *The exportation of the products of convict labor* is sometimes suggested as a solution of the whole problem. It is not easy to see how the exportation of the products of the prisons of the country can be made, for there is no demand for such products at all proportioned to the need, and the same objection may be made to the counter proposition to prohibit the sale of convict-made goods outside of the State in which they are manufactured. If this could be done by establishing custom houses on the borders of each State (an impossible and undesirable step), there would be no such demand for prison-made goods as would prevent their coming into direct competition with outside labor. It would thus utterly fail of solving the problem how to avoid competing with outside labor.

"5. *Convict-made goods to be stamped.* 'Prison-made' is a suggestion very frequently offered, either as a partial or as a full remedy in the case. In the majority of instances this would defeat the very objects for which the suggestion is proffered, for, as a rule, prison-made goods do not sustain the character for quality and faithfulness of manufacture belonging to the products of free labor, and if all convict-made goods were stamped in accordance with the suggestion, the competition in prices and sales would simply be intensified. The carrying out of the plan would, however, make a general boycott of prison-made goods very easy of accomplishment. The laws of some States already compel such marking, and with curious results. In one State, where some of the convicts are employed in making cigars, the boxes are stamped 'Prison-made,' or whatever the law demands; but over this stamp the internal-revenue stamp of the United States is placed; so, while the law of the State is complied with, the sale of the goods meets with no interference by the law. In another locality a certain prison has a reputation of making most excellent goods in a certain line, and these goods stand so high in the market that outside manufacturers have been known to stamp the products of their free shops 'Prison-made.' This plan would only result in a palliation of some forms of the difficulties and an aggravation of others.

"6. *The payment of wages to convicts.*—Some sincere friends of labor suggest that State governments pay to prisoners for their labor wages equivalent to those paid outside labor for the same quantity of work performed or amount of goods produced, and then sell the products in the open market, charging the prisoners for their maintenance, and leaving any surplus which might accrue over such charge in the hands of the prisoners. On the face of it this suggestion is exceedingly attractive in some ways. If it were practicable, it would lead the prisoners to an ambitious discharge of their duties, and would invest the product with a cost for labor and material equal to goods produced outside prison walls. An examination of the facts relating to income and expenses, however, dissipates the attractive elements of such a plan, and reduces it to the impracticable, for, under the most favorable circumstances of prison labor, as exhibited in the contract system, the average income from such labor pays but 65 per cent. of the running expenses of the prisons of the country. Of course, if the prisoners were paid wages equivalent to those paid outside, the income from labor would be greater, provided the goods could be sold. The result financially, however, would probably be that the State would pay the convicts for their labor and have to take back all such wages for maintenance, and draw on the treasury through appropriations for deficiencies. This becomes significantly true by an examination of the table on income and

Payment of Wages.

expenses, so far as overtime work is concerned. Of course, overtime work is allowed in but few institutions, but in those wherein it is allowed the amount is not sufficient to create much hope that the convicts could earn enough with safety to the State for each man to pay his share of the running expenses of the institution in which he lived. The suggestion is worthy, however, of most serious consideration and study. It is apparently new, and it would be interesting to have some institution make the experiment."

7. *The reduction of hours of labor in prisons* is a suggestion often made as one calculated to reduce the output of prisons, and thereby the amount of competition from the sale of products; but while this might be wise, it would be a very partial remedy of the difficulties complained of, since outside industries are moving toward the eight-hour day.

8. *Diversified industries.*—This is a plan prominently presented, and would meet the problem by scattering the competition over as many trades as possible, and therefore reducing the evil in any one trade to a minimum. One difficulty, however, is that great diversity of labor in prison is not practicable, except by the possession of such diversified plant as is almost impossible in ordinary prisons. States have often limited by

law the number of prisoners to be employed in any one industry; but even a small number in any industry may lower the wages in that industry. Moreover, however scattered, the total number of persons displaced by prison labor may be the same, altho not so noticeable as when concentrated in one trade.

9. *The utilization of convicts upon farms.*—This plan would cover, if adopted, but a limited field. In some of the great farming States, and in the South, it might be practicable, temporarily. The advantages of such a plan have been well stated by Governor Gordon, of Georgia, his reasons for recommending it being as follows:

"It would at once eliminate from our penitentiary system the serious objections to the old plan of close confinement, and the equally grave objections to the present plan of leasing.

"It would confine the convicts thus employed to such labor as would least compete with the honest labor of the State.

"It would place the State in direct and full control of its prisoners.

"It would restore to the State the full power to enforce the exact punishment imposed by the courts.

"It would place upon the State the just responsibility for guarding the health of the convicts, and would confine them to the most healthful employments.

"It would enable the State to separate them at all times according to classes, conditions, sexes, and fitness for different kinds of labor, and to institute methods for reformation with greater promise of success.

"It would make such portion of the penitentiary at least self-sustaining, I think, and, with proper management, might cause it to yield a larger net revenue, per capita, than that now derived from leasing.

"The adoption of this plan would in a very few years arouse the farming population of the country, and the opposition to convict farm labor would be greater than any which now exists against the employment of convicts in mechanical pursuits; but as a temporary matter, and in some favorable localities, it offers great advantages. Certainly, it would be well in all States to carry on small farms with prisons, the work to be done by convicts, and the products to be used for the prison itself, but not to enter the market.

10. *Hand-labor under the public-account system.*—This plan offers many advantages over any other that has been suggested to the Bureau. It involves the carrying on of the industries of a prison for the benefit of the State, but without the

Hand-Labor. use of power machinery, tools and hand-machines only being allowed, the goods to be made to consist of such articles as

boots and shoes, the coarse woolen and cotton cloths needed for the institution or for sale to other institutions, harnesses and saddlery, and many other goods now made by machinery or not now made at all in prisons. With such a plan in vogue throughout the United States, or in the majority of the States, there could be no complaint as to the effect of convict labor upon the rates of wages or upon the sale of goods, either in price or in quantity. The convicts could be employed under the direction and supervision entirely of the prison officers. None of the objections or disadvantages arising under the contract system, or the piece-price modification thereof, or under the public-account system with power machinery, can be raised

against this plan. The adoption of it would leave the State free to undertake the very best and most humane efforts for the reformation of prisoners."

It would be an expensive plan, but would reform the convict and reduce competition to a minimum. Says the report:

"The objection as to expense is not one of sufficient importance to merit very serious consideration. An objection, however, is raised, which comes closer to the prisoner himself, and that is that if this plan should be adopted, he goes out of the prison unfitted to take part in the industries as they are now carried on—that is, with power machinery. Is this objection valid? In the first place, it is seldom that a discharged convict enters the trade or the calling which he practised while in a prison, as they are at present conducted. If he works at boots and shoes in the prison, he runs a pegging machine, or a stitching machine, or a skiving machine, or a heeling machine, and if the objection is valid, when he goes he is limited to running that particular machine, except in this, that any man, skilled in the running of any machine, can easily run any other machine to a certain extent; but suppose he learns in the prison the whole trade of shoemaking, from cutting the stock to polishing the edges, is he at a disadvantage when he leaves? His chances of earning a living as a cobbler, where he works on his own responsibility and by himself, are greater than if he depended on getting into a great shoe factory. If he learns to run a hand-loom in weaving flannel or cotton cloth, is he thereby deprived of any advantage when he leaves the prison walls? He is better fitted to enter a cotton factory or woolen mill than if he had not had that experience, and far better fitted than the thousands who have been imported to engage in such work. If he is employed in making harnesses, which is almost entirely hand-work, he has a profitable trade when he leaves the prison. And so in almost any other direction. The convict who has spent his term of sentence on hand-made goods is, to say the least, as well qualified to earn his living when released as if he had been employed with the aid of power machinery. So this objection has no real vital elements in it, or any elements of sufficient vitality to prevent the adoption of the plan.

"Does not this plan offer the best possible opportunities for the technical education of convicts in all the various uses of tools, both in wood and metal working?"

"Suppose such a system, then, could be adopted, and the evidence shows that the system, on the whole, offers the best features of any that has been suggested to the Bureau, how can it be made to prevail in this country, where there are

48 distinct State or territorial governments? The system has this peculiar quality in it, that each State could adopt it without concerted action, altho the advantages to be gained by individual adoption would be small compared with those to be gained by its general adoption; but whatever plan is adopted must be adopted by the States individually. No plan for general adoption can be suggested except one to be enforced, by the United States Congress under the rights to be granted it through a constitutional amendment. If one State, however, adopts a plan, and that plan proves fairly successful, the other States will wheel into line.

"The plans which have been treated comprehend the majority of those which have been suggested to the Bureau, or which have, as already stated, been observed as coming from those who have investigated the subject of convict labor. It is clear to the mind of the writer that the facts sustain the complaints against the contract system to a sufficient degree to make it an objectionable system, but they also show—

"That such system, however, is the most profitable; that most of the plans offered simply shift the burden from one class in the community to another, but that with one exception they do not provide for the support of prisons by the whole people; and

"That the only plan offered which does accomplish, or approximately accomplish this, is that involving the employment of convicts under the public-account system without the use of power machinery.

"There are other considerations, however, in regard to this whole question, which are quite as important as the method of employment, but which affect the results of employment. It is of far more consequence to the working man of this country to reduce crime, and consequently the number of criminals, than it is to adopt this or that system of labor; but if there can be adopted a satisfactory system of labor and a contemporaneous reduction of the number of criminals,

Conclusion.

the highest possible results will have been reached. Labor is more thoroughly interested in securing the absence of crime and of the criminal than in the question as to how the criminal shall be employed.

"The true interests of the working men demand as much the study, by themselves and their leaders, of rigid and practical moral questions as the study of economic matters. As already intimated, convict labor is of no great account compared with the presence of crime itself, and to avoid the presence of crime its commission must be prevented. It is not enough to shut up criminals, and the tendency to lessen terms of imprisonment has not been salutary.

"So, the convict-labor question involves not only the system of work under which the convict shall be employed, but the higher consideration of a more statesmanlike treatment of the question of crime itself than has yet prevailed." (See PENOLOGY; CRIMINOLOGY.)

So far the report. It may be added that the objection to the various proposals for meeting the convict-labor problem always turns upon and implies the difficulty of outside labor in securing well-paid work. Provided that outside labor were treated better, there would be no objection on the part of working men to treating the convict in any way that might seem best for his or the community's advantage. What working

The Socialist View.

men object to is letting convicts earn their support or reformation at the expense of outside labor. They object to having convicts better treated than free laborers. Even the plan favored in the above report of the employing of convicts under the public-account system at hand work would, the report says, graduate the convicts in a condition much better fitted to earn their own living than many honest laborers. Even today many laborers commit crime in order to be imprisoned. It is exceedingly questionable, then, whether the problem is not to improve the condition and opportunities of outside labor, and then to approach the convict-labor problem. Socialists would have the State provide all with well-paid work, and maintain that crime would, in the first place, largely disappear, and, secondly, could then be wisely handled. Whether this be so or not must be discussed in the articles SOCIALISM and UNEMPLOYMENT; but this side of the case must not be forgotten in treating the convict-labor question.

COOKING SCHOOLS.—Schools for the teaching of cooking have been established in England many years. As early as 1863 Mrs. Mitchell opened a school of cookery at 111 Great Portland Street, London. By 1876 there was a Northern union of schools of cookery in England, which included many training schools, and has supplied teachers for all the world. The schools of Glasgow, Liverpool, and South Kensington have taken the lead. Cooking is now being introduced into the English board schools as well as others. France and Belgium have also followed suit, usually teaching laundry work in connection with cookery.

In the United States instruction in cookery was first given to public school children under the auspices of the Young Women's Christian Association in 1880, but private schools were established before this. In 1872 Juliet Corson was made secretary of the Free Training School for Women, and devoted herself to the study of healthy and economical dietetics. In 1876 she established the New York School of Cookery. In 1877 Maria Parloa lectured on cooking in Boston, and opened a school. She also gave classes and lectures at various seminaries and in evening schools. In 1882 she opened her own school in New York. In 1883 the North Bennet Street Industrial School, in Boston, established teaching in cooking for classes from the public schools. In 1885 Mrs. Hemenway established a vacation cookery school, and in the fall

it was accepted by the school committee as Boston School Kitchen No. 1. In 1888 the city assumed charge of it, and soon established other similar schools. Mrs. Hemenway also established a normal school in cooking. The examinations require a grammar school education and special acquirements in domestic and household economy, in the principles and processes of cooking in chemistry and physiology as applied to cookery. Under the name of the New England Kitchen, Mrs. Ellen H. Richards, of the Massachusetts Institute of Technology, with the assistance of Mrs. Mary H. Abel, has worked careful and valuable experiments, and other experiment stations have been started in the United States, following somewhat the theories of nutrition and of food values expounded in recent years by Vait and the physiologists of the Munich school. Most women's colleges, many Western agricultural colleges, the Drexel Institute, in Philadelphia, and the Pratt Institute, in Brooklyn, give courses in domestic science.

COOPER, PETER, was born in New York City, February 12, 1791. The son of a hatter, he received a meager education, and entered the trade of carriage-making. He gradually, however, took up one enterprise after another, with continuous success. In 1830 he established the Canton Iron Works, at Canton, Md., where he constructed from his own designs the first locomotives ever made in the United States. Soon after he established a rolling and wire-mill in New York. In 1845 he moved it to Trenton, and made it the largest rolling-mill of the day in the United States. He built three blast furnaces in Phillipsburg, and conducted other similar enterprises. He was one of the chief supporters of the laying of the Atlantic cable and other important enterprises. Deeply interested in the free education of the industrial classes, he gave the money for and laid the corner-stone of the Cooper Union in 1854, and saw its completion in 1859, to be "forever devoted to the instruction and improvement of the inhabitants of the United States in practical science and art." He gave \$200,000 as an endowment during his life, and \$100,000 by his will. The original cost when he conveyed it to the trustees was \$630,000. In 1876 Mr. Cooper was candidate for the Presidency of the Greenback (*g. v.*) or National Independent Party, and received some 100,000 votes. He died in New York City, April 4, 1883. He published *Ideas for a Science of Good Government, in Addresses, Letters, and Articles on a Strictly National Currency, Tariff, and Civil Service* (New York, 1883).

COOPER, THOMAS, born in Leicester, England, March, 1805; died in Lincoln, July 15, 1892. The son of a poor widow, he learned the shoemaker's trade. At the age of 23 he opened a school in Lincoln, and a year later became a Wesleyan Methodist local preacher. In 1839 he went to London to engage in journalism, but finding little success, he later returned to Leicester and joined the Chartists. He published a newspaper in their interests, and was nominated

for Parliament. He addressed many meetings, and aroused great excitement. A riot occurred at Hanley after he left; at Manchester military guards were placed in the street. He was arrested and taken back to Staffordshire on a charge of arson in connection with the Hanley riot, but he proved that he was not there when the offense was committed. He was then arraigned for conspiracy and sedition and tried before Sir Thomas Erskine, March, 1843. He defended himself eloquently, but was condemned to two years' imprisonment in Stafford jail, during which time he wrote the greater part of an epic, the *Purgatory of Suicides*, dealing with the social and religious questions of the age. After his release he wrote several other books of poetry and prose. He joined Mazzini's International League, but took no part in the Chartist agitation of 1848 on account of differences with O'Connor. He lectured on political and historical subjects. Having been a sceptic for 10 years and a follower of Strauss in 1855, he changed his views and lectured against atheism. In 1859 he became a Baptist preacher. Later his health broke down, and W. E. Forster and Samuel Morley obtained for him a small annuity. In 1882 he published his autobiography.

COOPERATION.—We consider this subject in this article under five heads: I. Definition; II. Varieties of Cooperation; III. History and Statistics of Cooperation in England and her Colonies, France, Germany, Belgium, Holland, Switzerland, Italy, Austria, and the United States; IV. Methods of Cooperation; V. Arguments for and Objections to Cooperation.

We commence with

I. DEFINITION.

Cooperation (from Latin *co* and *operare*, to work together) is used specifically in social science for the voluntary union of persons, in joint production, distribution, purchase, or consumption, apart from government, on equitable principles and for their mutual benefit. Such is, perhaps, a rightly exclusive and inclusive definition. Yet it must be admitted that the word is used by good authority both in a larger and a narrower sense.

George J. Holyoake, for example, defines it as "the concert of many for compassing advantages impossible to be reached by one, in order that the gain may be fairly shared by all concerned in its attainment" (*History of Cooperation*, vol. 1., p. 68). But this definition is obviously too broad. This definition would include the State, socialism, communism, every trades-union, almost every church, society, trust, monopoly, or combination of any kind. To use words so loosely is to misuse them, even tho it be admitted at the same time that the essence of the cooperative idea does often lie deep in all concerted life, especially in the true State, the true church, the true trades-union. Yet cooperation is not socialism, communism, trades-unionism, or aught else but cooperation, and should not be confused with them. On the other hand, the word has been too narrowly used. It has been said to mean simply "the voluntary union of consumers or producers for the purchase or production of commodities and the division of profits on the basis of the amount purchased or produced by the cooperators." But this is too narrow. It identifies one form of cooperation with cooperation itself. There are other forms. Each form of cooperation, indeed, is claimed by some to be the true form, but this claim cannot be allowed. The definition given above is believed to be inclusive of all forms of cooperation and

exclusive of all else. We may therefore proceed to distinguish cooperation from various propositions which have been confused with it, and first from ordinary joint-stock enterprises.

Says Mr. E. V. Neale, the veteran cooperator: "It is not unimportant that cooperators should make clear to themselves in what the essential difference between simple joint-stock enterprises and enterprises truly cooperative consists. The clear apprehension of this difference would, I believe, go far to remove the half-heartedness which checks the progress of cooperation from the indifference shown by too many cooperators to their own professed principles.

Not Joint-stockism.

"In a certain sense and to a certain extent all joint-stock companies are cooperative. The capitalists who form them club their resources for some common purpose; they choose the managers of the concern by common acts; they share together the profits; they bear together the losses of their venture. Why, then, are they not truly entitled to be called cooperators? Because all these acts, according to the common constitution of joint-stock companies, are done simply from the desire of the parties who do them to promote their own immediate advantage.

"No doubt joint-stock companies, *i.e.*, companies registered under the Joint-Stock Companies Acts, might be formed for a purpose of a far higher character. I deal with these companies only in the character which they commonly assume; in which they continually enter into an injurious competition with cooperative enterprises. And I say this is the essential distinction between the two. Joint-stock companies are trading corporations, established to carry on business for the benefit of those who set them up, by means of any contracts which the recognized rules of justice, enforced by courts of law, permit. Cooperative societies are trading corporations, formed to carry on business in accordance with principles of justice more perfect than those now enforced by courts of law; principles voluntarily adopted by their founders, who resolve to seek their own advantage only through and in subordination to these principles, and would regard the proposal to depart from them, in order to gain some greater advantage for themselves, as a bribe to wrong-doing. In this higher aim the true strength of cooperation, its inner strength, consists."

Again, cooperation must be distinguished from socialism, communism, and all similar theories. Socialism and communism attempt cooperative life in *all* its industrial aspects. Cooperation admits of persons uniting only for *certain* industrial ends. Communism contemplates communal colonies or separate communes; socialism aims at the development of cooperative life by the

Not Socialism.

whole community, the town, the city, the State, the nation. Cooperation differs from both in allowing a few individuals in a community, without leaving their homes or social environments, to unite for special cooperative purposes. Cooperation springs from individuals, socialism from the natural or geographical unity of a community. Socialism gives prominence to political methods. Cooperation *per se* makes little or no use of political life. The distinction thus between cooperation, on the one hand, and socialism and communism, on the other, is marked. And yet it must be pointed out that the two ideas are by no means inconsistent. The distinction lies more in the methods than in the aims, and even the methods may be united, altho not blended. The Belgian socialists, for example, have developed a strong cooperative movement. It were doubtless well, whenever possible, if all socialists and cooperators should work together. There is no reason in their aims why they should not. As a matter of fact, most socialists do theoretically believe in cooperation, only considering it unpractical on a small scale, while most cooperators believe their movement to be an education toward and preparation for the true socialism, in a cooperative state, a cooperative commonwealth, a cooperative civilization.

Still more carefully must cooperation and profit-sharing be distinguished, for tho in some aspects similar, they are in reality in economic and ethical principles radically distinct. Cooperation is a union of consumers or producers for their common benefit.

Not Profit-sharing.

Profit-sharing (see PROFIT-SHARING) is simply the employee sharing beyond his wages to some greater or less extent in the profits of his employer. Cooperation starts with the worker. Profit-sharing starts with the employer.

Cooperation gives the worker a voice in the management. Profit-sharing is the employer giving his employee no voice in the management, but simply a slight interest in the profits. Cooperation is fraternal. Profit-sharing is paternal. Cooperation tends to develop the individual worker by giving him a share in the responsibility. Profit-sharing gives him a little interest in the business, but with no general responsibility. Cooperation thus immediately aims higher, and is more difficult to put in successful operation. It comes into competition with gigantic private combinations and corporations. Profit-sharing, tho temporarily not aiming so high, claims to be more practical in preparing the way for eventual cooperation, and in not antagonizing great corporations, but rather in carrying into these very corporations the principles of equity and fraternity and generosity. Which, then, is to be preferred will depend largely on the temper and character of the parties concerned in the given case; we are here concerned simply with pointing out the difference.

II. VARIETIES OF COOPERATION.

Cooperation may be divided into at least three distinct kinds, and these, it must be remembered, are capable of subdivision into an almost infinite number of methods and combination of methods in carrying on cooperation. We may, however, indicate three general classes, leaving the history and argument to suggest the subdivisions. The three classes are:

1. Societies of distribution or consumption, where consumers unite to bring together or to maintain together stores of goods where members can buy at a cheaper rate, or with some advantage to themselves. Such are cooperative stores, wholesale, retail, etc.

2. Societies of production, where producers combine to gain the advantage of combination in production, and to sell the collective or individual work. Such cooperators are their own capitalists. They may cooperate in manufacturing, or in agriculture, or in any department of production.

3. Societies of credit or banking, where accounts of credit are opened with the members, and loans advanced to the members at favorable terms on fair securities. Such societies, in numerous modifications, as cooperative banks, friendly societies, burial societies, building societies, etc., exist in most cities. Owing, however, to these societies being in many ways different from the other kinds of cooperation, we shall consider them in articles by themselves under their separate heads. (See BUILDING SOCIETIES; COOPERATIVE BANKS, etc.)

Between these various classes of cooperation it is necessary carefully to distinguish, for one class is often perfectly practical when the other is not. Distributive cooperation has been largely successful, but was not the first attempted, and is by many severely criticised. Productive cooperation was first attempted, and is unquestionably the highest kind, but not unnaturally has met the least success. Credit cooperation has been the most successful, but as being nearest to ordinary business methods and least developing the principle of cooperation is by many not considered true cooperation.

The respective merits of these various kinds of cooperation will be best considered after studying

III. THE HISTORY OF COOPERATION.

We notice first the beginnings of cooperation, and then consider it in the principal leading

countries where it has been developed. For its beginnings we quote from George J. Holyoake, the eminent author of the *History of Cooperation in England*:

Writing in the *Fortnightly Review* (August, 1887), he tells us that cooperation dates from the latter portion of the last century.

"Ambelakia," he says, "was almost a cooperative town, as may be read in David Urquhart's *Turkey and its Resources*. So vast a municipal partnership on industry has never existed since. The fishers on the Cornish coast carried out cooperation on the sea, and the miners of Cumberland dug ore on the principle of sharing the profits. The plan has been productive of contentment and advantage. Gruyère is a cooperative cheese, being formerly made in the Jura Mountains, where the profits were equally divided among the makers. In 1777, as Dr. Langford relates in his *Centenary of Birmingham Life*, the tailors of that enterprising town set up a cooperative workshop, which is the earliest in English record.

Shute Barrington, Bishop of Durham, who established at Mongewell, in Oxfordshire, the first known cooperative store; while Count Rumford and Sir Thomas Bernard published in 1795, and for many years after, plans of cooperative and social life, far exceeding in variety and thoroughness any in the minds of persons now living."

"The only apostle of the social state in England," continues Mr. Holyoake, "at the beginning of this century, was Robert Owen, and to him we owe the cooperation of to-day. With him it took the shape of a despotism of philanthropy. Lord Sidmouth and the Duke of Kent gave him their personal influence to advance his views. Mr. Owen carried into practical use his ideas in his New Lanark Mills for educating his work-people, and with a success that has had no imitators except Godin, of Guise, whose Palace of Industry is known throughout civilization. Jeremy Bentham, who held shares in New Lanark, said it was the only investment he had made that paid him. It was here that Mr. Owen set up a cooperative store on the primitive plan of buying goods and provisions at wholesale and selling them to the working men's families at cost price.

"The benefit which the Lanark weavers enjoyed was soon noised abroad, and clever workmen elsewhere began to form stores to supply their families in the same way. The earliest instance of this is the Economical Society of Sheerness, commenced in 1816, and which is still doing business in the same premises and also in adjacent ones lately erected. Its rules stated that its object was 'to supply the members with wheaten bread and flour and butchers' meat.' The great war had long deprived them of both, and this society was commenced by intelligent dockyard-workmen, who, altho better paid than ordinary workmen, were yet subject to privations.

"Cooperation was also put to use on the Sussex coast, where Lady Noel Byron aided it, in order that the savings of the store might assist poor men in the way of self-employment, by keeping market gardens, and setting up tailors', shoemakers', and carpenters' shops. The desire of workmen to become their own masters, and the double prospect of independence and profit, spread the idea over the country as a new religion of industry. The cooperative stores now changed their plan. They sold retail at shop charges, and saved the difference between retail and cost price as a fund with which to commence cooperative workshops. By 1830 from 300 to 400 cooperative stores had been set up in England. There are records of 250 societies, distributive and productive, existing at that period, cited in the *History of Cooperation*."

Such is Mr. Holyoake's review of the early history of cooperation. Yet the real history of cooperation does not commence until 1844 in

ENGLAND.

England is the classic home as the birthplace of cooperation as a practical movement. Its beginnings here we have seen. But the early movement died away.

It should not be forgotten that cooperation received its first practical solution at the hands of the few poor weavers of Rochdale, in North England, who saved up a few shillings, afterward investing them in a bag of flour, which they distributed among themselves at cost price. It was this humble enterprise which marked

the beginning of the great Rochdale system, that now counts its establishments by thousands, its investments and profits by millions of pounds sterling, and takes its name from those poor weavers, the Rochdale Pioneers. April 25, 1844, the day when this society commenced work, is a red-letter day in the history of cooperation.

Rochdale Pioneers. When their society began it only had 28 members—£28 of funds—and the first year made no profit. In its second year it had 74 members, £181 in funds, £710 of business, and made £22 profit, 2½ per cent. of which was used as a fund for education. In 1876 its members were 8892, its funds were £254,000, its year's business exceeded £305,000, its profits were more than £50,500. Its profits have since been greater, tho, from causes it would be a digression to explain, they are now less. (For details, see ROCHDALE PIONEERS.)

The methods of the Rochdale and other early stores were very simple, as the following early account will show. "The societies have a public store, where goods are sold even to those who are not members. The condition of membership is the payment of a few pence. At certain intervals, further payments of a few pence are required from the new member (in most cases 2½ pence a week, or 10 pence a month), until their aggregate, together with the interest and dividends placed to his credit, amount to the prescribed minimum share in the undertaking. The sum in Rochdale was at first £4 (\$19.36), afterward £5 (\$24.30); in Manchester, however, only £1 (\$4.84). Each member has the privilege of letting his share increase to £100 (\$484); altho, in case of an excess of capital, the society can diminish the amount. Each member can, after previous notice, demand that his share, over and above the minimum share, be paid back to him, after an interval varying according to the amount; the minimum share itself, however, is not paid back to the member when he resigns, but may, with the approval of the society, be carried over to the credit of another, who thus becomes himself a member.

"A distribution of the net profits is made quarterly. After an interest at the rate of 5 per cent. per annum has been deducted from the shares of the members, and 2½ per cent. of the profits have been applied to the educational fund, the balance is placed to the credit of the members, in proportion to the purchases that each has made at the store during the preceding three months. The members are liable for no losses beyond the value of their respective shares. This right of allotment is governed by a special statute of August 7, 1862, which secures to the companies the same legal rights possessed by an individual.

"Every month there is a general meeting, in which every member has a vote. By this meeting, an Executive Committee of 12 is elected to manage the business of the society for one year, which holds a weekly session. This is the gist of the rules of the English societies, which differ only in minor particulars."

In 1849 commenced the Christian Socialist movement of the Rev. F. D. Maurice—the "Master," Charles Kingsley, Vansittart Neale, Thomas Hughes, and, above all, J. M. Ludlow, the real founder of the movement. (For their general principles and the history of their movement, see CHRISTIAN SOCIALISM.) It is sufficient here to state that their efforts were important, not for the immediate

Christian Socialists. results, since these were meager, but for the impetus they gave to the cooperative ideal, and to its ethical and enduring character. They started a society for aiding cooperative production, and as the result some cooperative tailor shops were begun. These, however, either did not live or were merged in the larger Rochdale movement. A more enduring result was the gaining by the Christian Socialist leaders successive improvements in laws which gave cooperative stores legal protection, and enabled cooperators to become bankers, to hold land, and to increase their savings to £200; which last provision led to some stores becoming rich, through the prospect it opened to members to acquire houses. This legislation with the ethical principles they so brilliantly advocated was the real contribution of the Christian Socialists to cooperation.

It is, however, the Rochdale movement that we must study to follow the real development of English cooperation. By 1856 the Pioneers had a capital of £12,000, and sold not only articles of grocery, but bread, meat, and clothing. In 1855 they commenced cooperative production, first hiring a small room, in which they placed a few looms, the beginning of their cooperative cotton mills. It was a success. Says Professor Fawcett (*Manual of Political Economy*, p. 266):

"Encouraged by this first success, the promoters of the undertaking determined to extend their operations, and part of a mill was accordingly rented. Their capital at that time was about £5000, and the system of conducting the business was as simple as it was excellent. A dividend of 5 per cent. on capital was the first charge on profits. After this dividend had been secured, the remaining profits were divided into two equal shares. One of these shares was given as an extra dividend on capital, and the other was distributed as a bonus among the laborers employed. Each laborer's share of this bonus was proportioned to the aggregate amount of wages he had earned. The most therefore was given to those who worked with the greatest regularity and the greatest skill; and as, in addition to this bonus, the wages current in the trade were paid, it was natural that the best efforts of those employed were stimulated, and the most prudent operatives in the locality were powerfully attracted to an undertaking where their labor received an extra remuneration, and where they obtained a lucrative investment for their savings. The undertaking developed so rapidly that soon a larger mill was required than any that could be rented. It was therefore resolved to build one: it was commenced in 1856, and completed in 1860, at a cost of £45,000. The mill was fitted with the best machinery and was complete in every respect. So confident were the workmen of the success of the scheme that the outlay involved in the erection of this mill did not exhaust the capital they were willing to invest, and accordingly a second mill was soon commenced. These mills had scarcely time to get into full working when the breaking out of the civil war in America brought the cotton trade of Lancashire into a state of unprecedented depression. Long after many of the surrounding manufactories had been closed the cooperative mills courageously struggled on."

Better times were awaiting them. Meanwhile, the success of their movement had created efforts at cooperation all over England, particularly at Manchester, Halifax, Huddersfield, Leeds, Newcastle, and Oldham. The last named became a cooperative town. Says Mr. E. B. Osborn, in Palgrave's *Dictionary of Political Economy*: "The 'Oldham Building and Manufacturing Society,' the first of its kind registered under the Joint-Stock Companies Act, was founded in 1853: capital, £1000 in £5 shares. The promoters were members of the Oldham Industrial Cooperative Society. Calls on shares were to be *qd.* weekly, and the directors were paid *6d.* a week for their services. Several months elapsed before all the shares were taken up, and a longer delay occurred before the society's business, weaving, could begin. At the end of the first quarter's working, a dividend of 7½ per cent. was paid, but afterward the looms were run at a loss. The difficulty of disposing of the manufactured goods, disputes among the directors, and between the shareholders and non-shareholders employed by the company, and, above all, the unsuitability of the climate for weaving, led to this result. It became necessary to make a radical change in the scheme, and accordingly the promoters decided to increase the capital to £14,870, and build premises for cotton-carding and spinning. The engines were 'christened' in 1863, and under the new name of the 'Sun Mill Company' business was carried on through the period of the Cotton Famine (see COTTON FAMINE) eventually with considerable profit."

The success of these somewhat numerous stores led to united effort. In 1863 the present Cooperative Wholesale Society, Limited, was founded as the North of England Cooperative Wholesale Society, Limited. It confined itself at first to purchasing articles at wholesale price and selling them to cooperative societies and companies, whether members or not, at a small profit, which was divided half yearly among all customer societies in proportion to their purchases, mere customers receiving only half dividends, customer members whole. Its sales in 1865 (the first complete year of its working) were £120,754. In 1872 these had reached £1,153,132. In 1872, however, the society began production, purchasing some biscuit works, and working in Leicester a boot factory in 1873, then soap works in 1874, other boot works at Heckmondwike in 1880. Leather-curring was entered on in 1886, a woolen mill taken over in 1887. Cocoa works were opened in 1887, a ready-made clothing department in 1888 (clothing having been already made up in two branches as an adjunct to the woolen cloth and drapery departments); a corn mill was opened in 1891, jam-making entered on in 1892, and a

Growth of Cooperation.

The Wholesale Society.

printing department undertaken, besides building departments in the society's three English branches—Manchester, London, and Newcastle (there is also a branch at New York). In addition to these there is a shipping department, the society having quite a little fleet of its own. During the quarter ending June 30, 1894, the society purchased a factory at Leeds for the manufacture of ready-made clothing.

Says Mr. J. M. Ludlow (*Atlantic Monthly*, January, 1895), to whom we are indebted for these statistics: "The success of the society as a whole has been prodigious. Its business in the distributive departments during the last quarter (ended June 30) was £2,272,946, or at the rate of upward of £9,000,000 a year, making it one of the largest commercial establishments in the world."

This society soon led to another. Says Mr. Ludlow: "The Scottish Cooperative Wholesale Society was established in 1868. It entered upon production in 1880 with a shirt factory, followed in the same year by a tailoring department (the two were united in 1888), by a cabinet factory in 1884, boot works in 1885, currying works in 1888, a sloop factory in 1890, and a mantle factory in 1891. A printing office had been opened in 1887, to which business ruling and bookbinding were afterward added. Preserve-making and tobacco-cutting have also been entered on. Many of the productive departments have been grouped together on 12 acres of land at Shieldhall on the Clyde, about three miles from Glasgow. The requisite buildings have been put up by the building department of the society, as well as several of its warehouses; and latterly a large flour mill at Chancellor, near Leith—I believe the latest productive venture of the society—has been built by it.

"The Scottish Wholesale Society has paid bonus to labor since November, 1870. The principle on which such bonus has been granted has varied, but by an alteration of rules made in 1892 bonus is credited to all employed at the same rate on wages as on purchases, half the bonus remaining on loan at 4 per cent."

In 1869 the first annual cooperative congress was held, and congresses have been held annually since. The present reports of these congresses cover over 200 large, closely printed, two-column pages, and give the latest information of the movement. Before these con-

gresses England's bishops and foremost preachers are invited to preach, and her ablest statesmen and leaders in social reform are eager to appear. The various cooperative societies, boards, and organizations in England are now limitless. There is a cooperative union, which represents the federated cooperative industrial and provident societies.

What it has done in the way of gaining legal advantages for cooperative societies may be summed up under two main heads.

1. The incorporation of the societies, by which they have acquired the right of holding in their own name lands or buildings and property generally, and of suing and being sued in their own names, instead of being driven to employ trustees.

2. The Industrial and Provident Societies Act, 1876, which consolidated into one act the laws relating to these societies, and, among many smaller advantages too numerous to be mentioned in detail, gave them the right of carrying on banking business whenever they offer to the depositors the security of transferable share capital.

The literature furnished by the union is varied and extensive. It publishes some hundreds of leaflets, pamphlets, and books for propaganda purposes. Lists and specimens may be had from the secretary. Among the writers are Messrs. Holyoake, Hughes, Kaufmann, Tom Mann, E. V. Neale, and Beatrice and Sidney Webb. One of its most useful publications is a *Manual for Cooperators*, edited by T. Hughes and E. V. Neale. Its 280 pages contain an introductory historical sketch of cooperation, and treat of the relations between cooperation and different philanthropic, political, and social movements.

September 2, 1871, was published the first number of the *Cooperative News*, the recognized organ of English cooperators. It is a penny weekly published in Manchester by a federation of cooperative societies, and had in 1894 a circulation of 41,500. For 13 years the cooperative wholesale societies have issued an *Annual* giving full statistical tables and diagrams of the growth of cooperation.

The following table, taken from the report of the Twenty-sixth Annual Congress (1894), shows the details of this growth:

Says Mr. N. O. Nelson (*The Outlook*, April 27, 1895), summarizing the history of English cooperation:

"Cooperation has already passed beyond the experimental stage. In Great Britain alone it now handles a business of over \$250,000,000 a year, from which a profit of over \$25,000,000 is returned on purchases, besides paying 5 per cent. interest on capital and accumulating a surplus.

Summary.

There are nearly 2000 retail associations, of which many have several branches. Some of the societies have as high as 30,000 members. The annual sales of the Leeds Society exceed \$4,500,000.

"Twenty-five years ago the retail stores formed a federation and established a wholesale society. Fifty millions a year is the business now done by the wholesale society. It has its own buyers in the important supply centers of the world, buying from first hands. It owns six steamships, which carry its cargoes from the continent and from Ireland. It does the banking and the insurance for the cooperative societies and individuals.

"The membership of those societies which are regularly incorporated and report to the Government is now 1,450,000, which represents a population of about 7,000,000, or one fifth of the United Kingdom. The societies predominate in the great manufacturing midland counties; in Lancashire and Yorkshire probably one half the people are cooperators.

"This whole system has grown from a little club of 28 very poor workmen who joined together just 50 years ago to buy their tea and flour at wholesale, for cash, and deal it out to themselves at the ordinary retail prices, for cash. That pioneer society now has 12,000 members and nearly \$2,000,000 capital. Two principles were adopted and rigidly adhered to—cash payments and full market prices. These seem small matters, but they are in fact far-reaching. For cash they can buy at the lowest value, and for cash they can sell without loss of bad debts and with less account-keeping. They cannot become insolvent, and they know all the time just how business is going. By charging the full market price, and incurring only the necessary expenses for distributing the goods, they accumulate a profit fund. This profit is made up in large part of what in private business goes out in advertising, expensive premises, bad debts, and disproportion between fixed expenses and business done. Those who know something of business will recognize that these items amount to a large percentage on sales and form a constant danger to capital itself. The customers and the proprietors being the same persons, the customer reverses the usual order and seeks the store. Dividends being upon purchases and not upon capital, the member has the strongest possible incentive to do all his trading at the store.

"Customarily he may become a member by subscribing for one share of, say, \$50, and paying thereon 75 cents or \$1. The remainder may be paid by applying the dividend on his purchases. He thus becomes a small capitalist by the mere process of trading at the store. Simple interest is allowed on capital, and a surplus is built up, but the divisible profits fall to the consumers in proportion to their respective purchases.

Each member has one vote, regardless of the number of his shares. A percentage of the profits is set aside to provide libraries, lectures, and propagandist literature. The original Rochdale Society has a most complete library, chemical laboratory, astronomical instruments, and branch libraries and reading-rooms at the branch stores.

"In connection with the stores, especially the wholesale, factories have been started on the capital accumulated in the surplus funds. They have many shoe factories, one of which is the largest in the world. They have extensive flour-mills, cloth-mills, bakeries, soap factories, and farms, and are gradually covering the whole field of their consumption. Having abundant capital, experienced managers and men, and consumers within their own organized ranks, the chief difficulties of manufacturing are eliminated. They are thus bringing face to face the actual producer and consumer, without the interposition of any middleman or private profit. The association and members being on a cash footing, they are not nearly so dependent on depression in trade. Consumption is not cut off, and the factories are not obliged to respond to the first breath of financial stringency. Thus it is that work in cooperative factories is much steadier than in private hands."

For further information as to English cooperation, see COOPERATIVE BANKS; COOPERATIVE FARMS; COOPERATIVE PRODUCTION.

THE COLONIES.

The Royal Commission on Labor report that in 1889 "little evidence was found of cooperation in industry or trade, and none at all of participation in profits by working men." They recommend that a labor bureau shall be established, and that, if established, it shall publish from time to time such information respecting cooperation and profit-sharing as may be obtainable. Distributive stores exist in Toronto and London, Ontario.

Canada and Newfoundland.

One of the London stores sells goods considerably cheaper than other establishments in the town, and another sells goods to stockholders at wholesale prices. Members must pay cash, and their orders are then executed at a wholesale house. They receive 3 per cent. discount, but this is reserved for the support of a reading-room and for other expenses. There is a cooperative store at the Sydney Mines, Nova Scotia, which has been in operation more than 20 years. The stock is owned by the miners, and they are only allowed credit up to the amount which they have invested; outsiders must pay cash. A similar store is reported to exist at the International Mines, Nova Scotia. No other instances of even comparatively successful cooperation are recorded, with the exception of two cooperative building societies, one at Hamilton, Ontario, and the other at Halifax. One hundred and twenty-eight houses had in 1888 been built with the help of loans from this association, and all but five of these were owned by mechanics. The Halifax Association is a cooperative savings and loan association, which lends money to stockholders only

on real estate security. Borrowers receive \$234 for each share, the face value of which is \$240, and pay \$4.20 monthly in instalments and interest.

Cooperation has little hold in Australasia. According to evidence given before the Royal Commission on Strikes, New South Wales, the establishment of purely cooperative business undertakings is hindered in Australia by the difficulty of raising sufficient money on such security as workmen can give. However this may be, practical experiments in Australasia have been few and far between. The Mosgiel Woolen Factory at Ashburton, New Zealand, which is conducted upon

cooperative principles, has proved a financial success; in 1891 it paid a dividend of 8 per cent. upon the share capital. But perhaps the greatest success in cooperation that has as yet been achieved in Australasia is that recorded by the Victorian butter factories and creameries, which were established with Government assistance in 1888, and which in 1891-92 exported 5,207,044 lbs. of butter to England. The Government fitted up a traveling dairy and sent lecturers throughout the colony to give practical instruction; they also grant a bonus on every pound of exported butter, graduated on the price which the butter fetches in the London market. The farmers, thus encouraged, send their milk to a creamery or a butter factory in which they hold shares, and receive every fortnight the proportion due to them according to the price of butter. There are 366 such factories now in existence in Victoria.

FRANCE.

The following review of cooperation in France and the other countries of Europe is mainly based upon and, in part, abridged from the reports on the various countries of the (English) Royal Commission on Labor, 1893-94. France, while the classic home of profit-sharing (*q.v.*), has had little development of cooperation. In the early half of the century, while there was much discussion of the principles of cooperation, it usually took the form of plans for cooperative communities or communism, and little resulted. What did result will be best studied under COMMUNISM; FOURIERISM; ST. SIMON; BUCHEZ; GUISE, etc. Cooperation proper in France dates from the Revolution of 1848, when the National Assembly opened a credit of \$600,000 to be loaned to cooperative societies. July 15 of that year a council was established to control the loans. In six months there were 430 requests for loans, amounting to \$5,400,000. Only 29 could be complied with, and that partially. Few of these prospered, and on the establishment of the empire a decree of March 25, 1852, abolished all workmen's societies. The law of 1867 gave an opportunity for cooperation, but little was done. In 1881 M. Flouquet endeavored to favor cooperative societies in Paris, and in 1888 certain privileges and exemptions from taxation were given to all cooperative societies in France. In spite of this little has developed. The socialists of France have usually repudiated cooperation and profit-sharing as reactionary, and the attention of capitalists and of the well-to-do has been mainly called to profit-sharing (*q.v.*). Nevertheless gradually some cooperative societies have developed. *The Almanach de la Cooperation Française* for 1892 (p. 93) publishes a list of 81 productive societies, besides cooperative dairies and fruit farms, 3 building societies, 18 cooperative banks. For the building societies and banks, see COOPERATIVE BANKS. Besides these there were 942 cooperative supply associations. One of the most flourishing of these, the Society of the XVIII. Arrondissement of Paris, was established in 1886, and owns premises costing \$68,000. In the first half of 1892 its sales were \$81,317. Another society, La Moissonneuse, was founded by 18 men in 1874. It has today 17 departments, with 13,574 members, employs 150 workpeople, and does an annual business of \$1,400,000. There are similar societies among the railway employees and the miners. A society at Nîmes, L'Abeille Nimoise, founded in 1883, works very closely after the Rochdale system. In 1886 a Comité Central de l'Union Coopérative was established. See also PROFIT-SHARING; GUISE; LECLAIRE; BOUCICAUT, etc.

GERMANY.

Cooperation in Germany has developed more recently, but with considerable strength. Says the English Labor Commission's report on Germany:

"The cooperative movement as a whole began much later in Germany than in England or France, and in its first beginning it took a different form. England

had made a start with distributive cooperation from the point of view of cheapening the necessaries of life, and France had begun with productive cooperation among laborers and small artisans, but the first attempts at cooperation in Germany arose from the desire on the part of the artisan class to relieve the distress due to factory competition, by obtaining the credit and the raw material necessary for their work at a more reasonable cost. In 1848 certain loan associations, or people's banks (*Darlehenskassenvereine*), were established, but as they lent money without interest, and were subsidized by philanthropic outsiders, they soon came to be regarded by the artisans as mere charitable associations, and were held in small esteem. In 1849 Herr Schulze-Delitzsch, who for years was the life and soul of the cooperative movement in Germany, founded the first cooperative society for the purchase of raw material among 13 cabinet-makers in Delitzsch, his native town. A shoemakers' cooperative society soon followed, and the results of these two first attempts were so favorable that during the next few years a considerable number of such societies were formed in the neighboring towns. In 1850 Herr Schulze founded the first of his loan associations (*Vorschussvereine*), which differed from the earlier banks in that the persons to whom loans could be granted must themselves be members of the association paying regular monthly contributions. They thus themselves indirectly furnished the security for the credit afforded them. After a time both the societies for procuring raw material and the loan associations were federated, and the security thus afforded by the unlimited liability of all the members of all the associations for the obligations of any one association rendered it easy to procure the necessary capital. Tho the societies for procuring raw material form the necessary basis for productive cooperation, the highest development of the cooperative idea, their expansion was less rapid than that of the loan associations which had been founded later. Productive cooperation itself scarcely appears at all, and indeed, as has been already stated, it has at no time been able to show a very successful record in Germany. Herr Schulze himself was averse to premature effort in this direction, and held that success must be preceded by a long preliminary education in other forms of cooperation. Between 1860 and 1870 a movement was set on foot for the establishment of retail distributive societies (*Konsumvereine*), and the attention of the working classes was attracted to these stores by the quarrel which resulted between Schulze and Lassalle. The history of cooperation in Germany has since been a continuous progress. It has not yet been possible to establish a wholesale society, but the rapidly increasing number of distributive societies are strongly in favor of such a measure, and Dr. Crüger speaks of its early adoption as probable. The movement has spread from industry to agriculture. The necessity of economy in procuring the requisite stock and implements, if agriculture is to be pursued at a profit, is now generally recognized, and cooperative societies for the purchase of agricultural necessities, cooperative dairies, cooperative workshops, and agricultural banks or loan associations are exceedingly numerous. Cooperative societies for the settlement of estates in the Eastern Provinces are the latest development, and cooperation as applied to the actual working of the land is regarded by many authorities in Germany as likely to be productive of most important results. Much of the success of cooperation in Germany may be ascribed, according to Dr. Crüger, to the fact that at a very early period the individual societies were organized into larger associations, and thus enabled to profit by each other's experience and to afford each other necessary support. In 1859 a congress of members of loan associations was summoned by Herr Schulze to Weimar; here a central committee was appointed, with Herr Schulze at the head, which in 1864 developed into the General Association of German Cooperative Societies (*Allgemeiner Verband Deutscher Erwerbs und Wirtschaftsgenossenschaften*), including all forms of cooperation within its limits. The secretary of the association publishes a yearly report of the financial position of the societies, with a critical account of the progress of the various forms of cooperation. The association is subdivided into 33 minor associations, some for certain provinces or districts, others for particular trades. The directors of the smaller associations constitute the committee of the general association, whose duty is to advise the secretary in all important matters. The secretary is himself elected at the annual meeting of the association.

Schulze-Delitzsch.

The agricultural cooperative societies possess a similar organization, founded with Herr Schulze's assistance in 1833, and known as the German Agricultural Cooperative Union (*Vereinigung der landwirtschaftlichen Genossenschaften des Deutschen Reichs*). In 1886 it included 1730 credit associations, 975 associations for procuring raw material, 931 cooperative dairies, and 101 other cooperative societies. The peasants' land banks, founded by Dr. Raiffeisen, have an association of their own, and there are other smaller federations of cooperative societies." (See COOPERATIVE BANKS.)

Such is a general view of German cooperation in actual effort, but its real beginning is to be found even before the efforts of Schulze-Delitzsch in the work of Hüber (*q.v.*), who as early as 1838 was invited by Friedrich Wilhelm IV. to establish in Berlin a paper called the *Janus*, advocating cooperation.

On May 31, 1893, according to statistics furnished to the English Cooperative Congress by Dr. F. Schneider, and printed in its report for 1894 (p. 141), cooperative institutions are of the following classes:

Statistics. 4791 people's banks against 4401 on May 31, 1892; 2770 societies carrying on various trades against 2840 on May 31, 1892; 1283 distributive societies against 1222 on May 31, 1892; 77 building societies against 55 on May 31, 1892; 8921 on May 31, 1893, against 8418 on May 31, 1892. Dr. Schneider adds:

"Trading societies, as we record at the commencement, show a decrease in numbers. Especially is this falling off noticeable in the societies of handicraftsmen, altho year by year the example of few societies which have been in existence over 30 years for the purpose of supplying the necessary unworked material to tailors and shoemakers, proves that such material can be obtained from these societies considerably cheaper than from the merchant. Unfortunately, however, the present feeling among handicraftsmen is not favorable to cooperation. The cooperative warehouses and productive societies also show a decline in numbers.

"Some of the various classes of agricultural societies have likewise experienced a decline. In some places they appear to have proceeded with the establishment of societies for the supply of raw agricultural produce, where the essential conditions for the existence of such societies have not been present, and consequently many of the concerns have ceased to exist. On the other hand, the number of agricultural productive societies, mostly dairies, has gone up in 1892 and 1893 from 1087 to 1196. The Agricultural Union at the end of 1893 numbered 1868 societies with 150,000 members (including 551 country banks). The General Union of German Industrial and Agricultural Cooperative Societies was composed at the end of 1893 of 1480 societies, with a membership of not under 500,000.

"Of the distributive societies 344 (against 302 in 1891) have published their balance sheets for 1892. We tabulate therefrom the most important figures, comparing them with the corresponding figures for 1891.

	1892.	1891.
Total number of members.....	243,529	229,126
Sales for year.....	£3,360,028	£3,164,644
Working capital—		
In members' share claims ...	240,231	223,066
In reserve funds.....	123,700	118,036
In loans.....	276,019	239,406
Amount owing to societies for goods.....	45,385	49,406

"These outstandings for goods issued arise owing to several of the societies not strictly adhering to the principle of cash sales. At the end of 1892, 920 societies (against 75 ending 1891) had £11,856 (against £10,492 in 1891) outstanding for goods sold on credit. Where true economic principles are observed it may sometimes be excusable (with such goods as coals, potatoes) to sell on credit, but unfortunately many large outstanding accounts cannot be explained away in this manner. Of the membership of distributive societies dependent work-people of the various trades form 56.7 per cent.; tradesmen, 13.0 per cent.; doctors, chemists, public officials, etc., 8.7 per cent. All classes are represented on the membership roll of distributive societies as they are in the People's Banks, altho naturally in a different ratio. Eight building societies have reported progress. Ten societies had 1600 members, with £16,494 share capital, £3501 reserve fund, £106,720 in loans repayable

after the lapse of at least two years and in mortgages, £5458 in loans repayable under two years. On the other hand the property, completed and in course of erection, was estimated at £90,403, the land not yet built upon, £17,750. Of the 99 houses built from time to time by one society, 33 had passed into the hands of individual members."

According to the English Labor Commission report, the 2840 trade societies of May, 1892, were divided as follows:

(1) *Raw Material Societies*, the members of which combine for the purchase, at wholesale prices, of the raw materials necessary for their trades, the great majority (1020 out of 1130) being agricultural.

(2) *Work Associations*, the special object of which is the purchase, with capital subscribed by the members, of tools, machinery, etc., which is then hired by members at a fixed rate, the moneys so received being divided among the members in proportion to their shares; a certain sum having first been put aside for a reserve fund. The great majority of these associations (299 out of 312) are agricultural.

(3) *Depot Associations*, which provide a general store or shop in which members may sell the produce of their trade. The loan societies very often carry on business with these by advancing money to members on the security of their goods. They also, under certain circumstances, have something of the nature of raw material and productive societies. There are said to have been 71 of these associations in operation on May 31 last (64 industrial and 7 agricultural).

(4) *Productive Associations*, of which the report mentions altogether 1238—1014 being dairy societies, while 73 exist for other purposes, including cattle-rearing, forestry, and fishing, and 151 are industrial.

BELGIUM.

The beginning of the cooperative movement in Belgium was simultaneous with the formation in Paris, after the revolution of 1848, of a large number of productive cooperative societies. A considerable number of tailors', shoemakers', and printers' cooperative societies were established in Brussels and Ghent, but were with one exception, shortly afterward dissolved. The first distributive societies were the cooperative bakeries established in 1854 at Ghent and Antwerp, but these also enjoyed only a brief existence. A certain number of societies for the purchase of stores for the winter were established a little later, chiefly among the members of friendly societies; in 1865, 12 of these societies were in existence. Between 1864, when the first "people's bank" was instituted at Liège, and 1873, a large number of societies were established, mainly through the influence of the *Internationale*, but the lack of recognition and protection by the law, as well as of proper organization among the working classes, and in some cases the bad management and dishonesty on the part of the managers, brought about the dissolution, by 1873, of almost all the societies, with the exception of the various distributive societies established in 1869 at the Mariemont and Bascoup collieries. In 1867, M. Anspach, the burgomaster of Brussels, established cheap dining-rooms for working men, one of which still remains in Brussels. In 1871 M. Bara brought forward a bill for the recognition of cooperative societies, which became law in 1873, and, with certain slight modifications introduced in 1886, still remains in force. In January, 1878, however, there existed only 13 cooperative societies established in accordance with this law, and of these 10 were people's banks.

The real development of cooperation in Belgium has been in connection with the Belgian socialist movement. (See BELGIUM AND SOCIAL REFORM.) In 1879, largely under the lead of the socialist Anserle, a cooperative bakery was begun in Ghent. This movement has given cooperation in Belgium a firm hold. Between 1885 and the end of 1892, 303 societies were established, whereas only 45 were instituted between 1873 and 1884. Agricultural cooperative societies were commenced in 1885. There are also cooperative dairies, drug stores, insurance societies, banks, and distributive societies of many kinds.

At present, no general federation of cooperative societies has been formed in Belgium. In 1869 a federation of people's banks was established, which holds an annual congress, and in 1887 the question of federation was debated at a congress of delegates from cooperative distributive societies, convoked by the "*Vooruit*," and a provisional committee was appointed. At the annual congress of the Labor Party in 1890 the question was again in-

Cooperation and Socialism.

General Condition.

roduced, and a few days later a federal council was established at Ghent. About the same time, the cooperative societies of Government employees instituted a federation, to which 13 societies of employees are now (1893) affiliated. A local federation of cooperative societies was established at Liège about 1891.

The really most general cooperative organization in Belgium is the Labor Party, which is so strong and so thoroughly organized that by declaring a general strike, it forced the Legislature, against its will, to grant, the recently very much enlarged suffrage. (For further details see BELGIUM AND SOCIAL REFORM.)

A cooperative bakery and club called Vooruit were formed at Ghent, followed soon by a similar society in Brussels called the *Maison du Peuple*. Soon the movement spread through all the Belgian towns. The most important societies are those at Brussels, Antwerp, Ghent, Liège, Louvain, Charleroi, Namur, Verviers, La Louvière, and "*Le Progrès*" at Jolimont. In industrial centers such as Charleroi, Borinage, and the Center of Hainault, the cooperative society began by selling flour and butter, but it was soon found that a cooperative bakery could produce bread far more cheaply than it could be produced by each family for their own consumption. With the exception of the cooperative society at Jolimont, where bread is sold at the lowest possible price, these societies have almost all adopted the system of the Pioneers of Rochdale, selling at the current trade prices, and dividing the profits realized at the end of a certain period, generally a year or six months.

The movement, however, is wholly in the hands of the (socialist) *Parti ouvrier*, and no small portion of the profits are spent for socialist education, literature, and propaganda. The club houses are centers of socialism, and usually one must belong to the party to have the benefits of the society.

The great society "*La Maison du Peuple*" at Brussels, begun 1882, is representative. It was legally established in 1888, and in 1893 it numbered 10,000 members, and manufactured more than

La Maison du Peuple.

100,000 loaves a week. It possesses real property, having a tool-store, a library, and other premises, worth in all several hundred thousand francs. The objects of the society are to establish and work bakeries, and, as the funds allow, to establish butchers' shops, restaurants, cooperative workshops, general provision shops, libraries, reading-rooms, and other institutions. Its duration is fixed at 30 years from July 1st, 1888. The minimum capital of the society is 10,000 francs, and its liability is limited to the amount of the assets. Each share is worth 10 francs, payable in four half yearly installments. Persons who wish to join the society must purchase a share and adhere to the program of the Labor Party (*Parti ouvrier*), to which it is affiliated. Members who deal for one month elsewhere than at the society's establishments, or otherwise infringe the rules, may be excluded by the council of management and a majority of two thirds at the general meeting. A member who has resigned or been excluded receives his share, and the dividends to which he is entitled, in bread or other goods sold by the society, except in special cases, when he may be paid in cash. General meetings are convoked quarterly by the council of management, which meets at least twice a month, and consists of members of all the sections. An executive committee, to carry out the decisions of the council and the sections, is composed of one member from each section. The sections consist of six members, five elected by the general meeting and one by the men employed (*personnel*) in that branch; the bakery section is composed of nine members, two of whom represent the men employed. Deductions from the half yearly dividends are made of 2½ per cent. for the staff, and of 25 per cent. for a reserve fund, at least half of which is employed for socialist propaganda, and the remainder is added to the funds. Each member pays five centimes a week to the provident fund, from which he is allowed, in case of sickness, seven loaves weekly for two years. In 1890 a medical aid society (*Service médico-pharmaceutique*) was established, which, for a weekly payment of five centimes for each person, provides members of the cooperative society and of the Brussels federation of the Labor Party with medical attendance and medicine gratis.

HOLLAND.

Dutch cooperative associations are subject to a special law passed in 1876, which determines their scope and constitution. Several cooperative associations existed before this law was passed, but their number has since been considerably increased.

The cooperative form of association has been applied to building societies and credit banks, as well as to the more usual forms of distribution and production. The principal productive societies are two printing establishments situated respectively at the Hague and at Leeuwarden, the cooperative bakery "*Volharding*" at the Hague, and another at Amsterdam.

The Leeuwarden printing establishment has been in existence for 17 years, during which time it has paid an annual dividend of from 7 to 10 per cent. over and above the 5 per cent. interest on share capital. Some 10 workmen out of a staff of 38 are shareholders.

The *Volharding* bakery at the Hague is managed chiefly by socialists, tho the socialist party as such has nothing to do with it. The workmen's wages at this bakery are higher than elsewhere, and the hours are much shorter; there is no Sunday work and the hours per day are only eight. In 1890 the bakery paid a dividend of 11 per cent., in 1891 of 10 per cent., and in 1892 the price of bread was reduced 1 cent per kilogram.

Cooperation has succeeded better where it has confined its efforts to retail distribution. In 1886 the number of these associations was stated as 33, and cooperative shops are now to be found at Amsterdam, Rotterdam, the Hague, Haarlem, Leiden, and many other towns and villages.

The most important among distributive societies, that, namely, known as the *Eigen Hulp*, was founded at the Hague in 1887 with the object of supplying the working classes with the necessities of life at very moderate prices. It has, however, lately developed into what is practically a joint-stock supply association, with branches in all the large towns, and drawing its customers chiefly from the upper classes. The "*Social Interest Society*" was formed to counteract the aristocratic tendencies of the *Eigen Hulp*. The rise of cooperation in Haarlem is attributed to the discussions which took place among working men during the congress of the *Internationale* at the Hague in 1872. The employees of the Holland Railway Co. at Haarlem thought that the projects of the socialists were somewhat visionary, and as a step toward more practical results they formed an association for the purchase of coal, potatoes, rice, etc., on cooperative principles. The numerous building societies which now exist in Haarlem are the result of this beginning.

The *Verbruiks-Vereeniging* of Rotterdam was founded in 1874. Every member must hold a share of the value of 25 florins. The accounts are made up quarterly, and the net profits divided among the members in proportion to the value of their purchases.

All these societies are strictly local, and no central organization exists.

SWITZERLAND.

Cooperative distributive societies formed on the English pattern were founded in Switzerland at an earlier date than in any other continental country. The institution soon took firm root, and now 63 societies, exclusive of local branches, are reported in various parts of the country. The most usual form of the distributive society is an association for the wholesale purchase of food and household commodities. The articles bought at wholesale prices are sold to customers at prices varying from 5 to 7 per cent. below those of ordinary retail dealers. Some societies have also undertaken the management of restaurants, where a meal of soup, meat, and vegetables can be had for about 40 c. (8 cents).

The capital is formed either by weekly subscriptions or by the issue of small interest-bearing notes for sums as low as three frs. The net profits go to form a reserve fund or to extend the operations of the society. Most of these societies enjoy a high degree of prosperity. In 1880 the *Société Suisse* of Geneva sold 272,000 francs' worth of commodities in a single week, on which it realized a net profit of 30,000 frs. The average quarterly dividend of this society is 12 per cent., its reserve fund amounts to 10,000 frs., and its capital consists of 10,000 frs. in shares of 10 frs. each. One of the oldest and most important associations is the *Consumverein* of Zurich. This society was founded in October, 1853, by eight members of the *Grütliverein*, with a joint capital of 75 frs., which they employed in the purchase and sale of cigars. At the end of a month the membership had increased to 10, and by the end of January, 1854, 128 new members had been enrolled. The joint capital was employed in making and selling bread. Our figures are taken from the (English) Labor Report.

The cooperative principle has been applied with great success to banking operations in Switzerland,

where 242 out of the total number of savings banks are owned by cooperative societies. Some 600 cooperative societies of various kinds are now in existence; these include 305 cooperative dairies, besides a large number of societies for the insurance of cattle, fire insurance, etc.

ITALY.

Cooperation in Italy, as we shall in a moment see, connects itself with the past, yet has only recently been thoroughly organized. In 1886 and 1887 the first and second congresses of Italian cooperators met at Milan, and the Federation of Italian Cooperative Societies was constituted. A central committee was appointed, reports on the progress of cooperation in Italy were read, and accounts of the sums expended by the federation were rendered. A journal, *La Cooperazione Italiana*, was established, statutes for the federation were drawn up, and an international federation of cooperative societies was projected.

The most marked and peculiar success of cooperation in Italy has been of cooperative societies of day laborers. The origin of day laborers' associations has been traced back to the companies of Lombard masons, who, in the Middle

Day Laborers' Unions.

Ages, wandered through Europe building cathedrals and palaces. The movement has developed in an extraordinary manner since 1838, especially in Romagna, where it first began, and where the metayer system, which has now almost disappeared, was once widely diffused.

In October, 1887, the deputies Marin, Badaloni, Tedeschi, and Villanova made an appeal to the peasants of Rovigo (*Polesine*), urging them to form a cooperative society. Their appeal was published in *La Cooperazione Italiana* as an appendix to the Report of the Second Congress of Italian Cooperators, but it met with no response. In October, 1888, Signor Marin opened a "cooperative campaign," which lasted for a whole year. The first conference was held at Contarina on November 24, and soon afterward a day laborers' cooperative society was formed. Other conferences followed, and fresh associations were constituted at Isola di Ariano, Papozze, Laura, Gavello, and many other places. In all 15 day laborers' societies were established, besides four associations of day laborers and builders. These 19 unions had almost 8000 members, drawn from the ranks of the poorest peasants in Italy. In 1890 Signor Marin was using his utmost efforts to unite them all in a federation (*consorzio*), in order to enable them to undertake important public works.

The organization of these societies and the system of payment to members which is observed are very simple. The society makes a contract for a given piece of work at a given price, and then sublets the work by the piece to gangs (*squadre*) of its members. It provides the necessary tools if the workmen do not possess them, and gives a price equal to that which it has received, minus the expenses of administration. While the work goes on the members receive instalments of pay for their immediate maintenance. When the work is finished the quantity done by each man is estimated, and he is paid a proportionate share of the profits.

The most important associations are those of Ravenna and Budrio.

Cooperative dairies also occupy a prominent place in Italy. (See COOPERATIVE FARMING.)

The first distributive societies in Italy were founded early in the second half of this century. A cooperative store was started in 1853 by the General Society of the

Working Men of Turin, followed by another at Alessandria, which was opened in 1854. The capital of many of these original societies was obtained by means of subscriptions from wealthy persons, and in some places they were even organized by the municipal authorities. To this form of distribution others opposed the more purely cooperative English type, based upon the scheme of the Rochdale Pioneers. They believed that the consumers would benefit more by receiving the profits of the society in the form of dividends than by a constant diminution of retail prices. The Italian Industrial Association was formed at Milan, to promote the development of industry in Italy, by the foundation of people's banks, benefit societies, and strictly cooperative societies of consumption and production. Other associations with the same objects were instituted in several Italian towns, and a newspaper, called *Cooperation and Industry*, was started. In 1864, distributive societies on the English system were founded at Como, San Pier

d'Arena, and Milan, and between 1867 and 1870 many others arose at Bologna, Belluno, Cremona, Chiaravalle, Città di Castello, Faenza, Ferrara, Imola, Lodi, Lugo, Piacenza, Siena, Treviso, Udine, Verona, Vicenza, Venice, and elsewhere. In 1865 there appear to have been about 52 such societies in Italy, and by the end of 1873 this number had risen to 85, including 16 associations on the English system. Unfortunately the hopes raised by this brilliant beginning were destined to disappointment. The Italian distributive societies were a foreign importation and the result of many isolated forces; they lacked unity in direction, in form, and in aims. The severe English type, with its complicated system of reckoning, could not be maintained, for the consumers, urged by necessity, preferred a great immediate fall of prices to the slow accumulation of profits. The original stores have succeeded better, especially the one at Milan.

In 1864 a woman's cooperative store was started in Turin. In 1888 the men's stores distributed goods to the value of 1,051,840 lire, and the women's stores had effected sales to the value of 600,966 lire. Both societies sold below the market prices, yet in 1888 their respective realized profits amounted to 20,128 lire and 7,318 lire.

Another form of Italian cooperation are associations among railway officials. They are of recent origin, but are becoming widely diffused throughout Italy. They are formed by means of small shares, varying from 20 lire to 100 lire. Their object is to provide the members and their families with the necessities of life, of good quality, and at a moderate price. With this purpose they open cooperative stores for the sale of necessities to the members, and some even directly produce salted meat (*salsini*), bread, and other commodities. They all appear to sell their goods below the market price. Some even pay no interest to the shareholders, and sell at cost price, with a slight addition for the expenses of the society and for the reserve fund. Others sell at a higher price, dividing the profits among the shareholders, or using them to increase the number of shares. These societies have a great advantage in the ease and cheapness with which, owing to their connection with the railway, they can convey goods from one place to another. The first cooperative society among railway officials in Italy was founded at Turin in 1873.

"The question of improving the dietary of the peasantry is one of great and increasing importance in Italy." In Northern Italy the staple food of the agricultural population is Indian corn, which often induces *pellagra* from being used in a damaged condition. Since

Bakehouses.

1860 the question of establishing cooperative and other bakehouses in the rural districts has been before the public.

Don Rinaldo Anelli started a small cooperative bakehouse at Bernate, which proved a great success. In 1884 the Government offered to pay half the expense of starting new establishments, and by 1885 the total number of cooperative bakehouses in Italy had risen to 38. Some of these, however, appear to have been subsequently closed with loss, and Signor Volpi, a landed proprietor of the province of Milan, is of opinion that the peasantry are not yet ripe for cooperation, but that it is the personal duty of the landlord to see that his tenants are well and properly fed. The various communes and the Milan Savings Bank, as well as the Ministry of Agriculture, have voted subsidies for the same purpose.

A beginning has been made toward the formation of cooperative farming associations in Italy, but the movement is not as yet of much importance.

The statistics of cooperation in Italy in 1891 were:

Dairies.....	208
Day Laborers' Societies.....	49
Masons'.....	43
Industrial.....	109
Manufacturers.....	52
Raw Material.....	9
Building.....	69
Distributive.....	681
Various.....	22
Total.....	1,242

AUSTRIA.

The first and still to-day the most numerous cooperative societies in Austria are the loan societies, modeled after the German. They began to come into existence between 1850 and 1860. Distributive societies are the next in importance. Building societies were commenced about 1870. Productive societies number only

about 200, and of these more than one half in Vienna. There are besides cooperative dairies, societies for buying raw material, etc. There is a general cooperative union, which in 1892 had a membership of 217 societies. *The Austrian State Handbook for 1893*, p. 236, reports 2301 cooperative societies of all kinds in Austria, 1882 being loan societies and 324 distributive.

THE UNITED STATES.

Cooperation in the United States has had a very much longer and fuller history than is usually realized. It has reached very large proportions. In cooperative credit associations it is scarcely equalled; in attempts in cooperative communities it has led the world, and seems to-day as fertile in new attempts as ever in its history. It, however, is, except in the cooperative bank movement, utterly unorganized as a national movement, and most of its early attempts have proved of short duration. Dr. R. Heber Newton, in his *Social Studies* (1887), gives the following interesting table of the main events in the history of American cooperation:

- 1730 (*about*).—Share system introduced into New England fisheries.
- 1752.—Fire assurance introduced in Philadelphia. "The Philadelphia Contributionship for the Insurance of Houses from Loss by Fire." Benjamin Franklin first director. Corporation still prospering.
- 1767.—Life insurance introduced in Philadelphia. "The Corporation for the Relief of Widows and Children of Clergymen in the Communion of the Church of England in America." Composed of clergymen. Still flourishing.
- 1819.—Mutual assurance bodied in a national order—the Odd Fellows.
- 1820-30.—Owen's movement; socialistic.
- 1830-40.—Loan and building societies formed in Philadelphia. New England Association of Farmers and Mechanics agitate the formation of stores. Labor organizations in New England open some stores.
- 1840-50.—Brook Farm, Hopedale, etc. Fourierite phalanxes. New England Protective Union builds up a system of stores; which at their height did a business of about \$2,000,000 per annum; some of which still survive. The earliest essay in cooperative production—Tailors' Association in Boston (1849).
- 1850-60.—Loan associations arise in Massachusetts. Associate dairies started in New York. Anaheim.
- 1860-70.—Stores started in several States. Productive societies also. Revival of building and loan associations in Pennsylvania. Mutual assurance assumes business forms. Renewed attempts at cooperative production. Ship-yard in Baltimore (1865), in Boston (1866); machine shop in Philadelphia (1866); foundries in various cities; shoe manufactory in Lynn and in North Adams (about 1868); cigar manufactory in Westfield, Mass. (1869).
- 1870-80.—Knights of St. Crispin agitate cooperation. Founding and growth and decline of the Patrons of Husbandry; which order claimed to save in one year (1874) \$12,000,000 to its members, through its cooperative agencies. Founding and growth of the Knights of Honor—a great mutual assurance association. Still flourishing.
- Founding, growth, and dissolution of the Sovereigns of Industry; which order did a cooperative business in one year (1877) of \$3,000,000; representing a saving to its members of \$420,000; all of its stores being on the Rochdale plan; some of which are still prosperous. Scattered stores in many States; Massachusetts reporting 15 independent stores organized since 1870. Philadelphia Industrial Cooperative Society organized (1875). Independent productive societies in many States. Rapid growth of associate dairies, of which there are now 5000 in the United States. Rapid growth of mutual assurance companies; the

Patrons of Husbandry having at one time in one State alone 38 fire insurance companies; three companies in one county carrying over \$1,000,000 of risks; New York State claiming 300,000 members of various mutual assurance societies at end of decade.

Rapid growth of building and loan societies in Pennsylvania, which now number over 600 in Philadelphia, with a membership of 75,000 and a capital of \$80,000,000; which number in Pennsylvania from 1500 to 1800; which have led to investment of \$100,000,000 in real estate in Philadelphia alone.

Revival of loan associations in Massachusetts; where are now over 22 societies incorporated, having a total membership of over 6000.

Institution of loan associations in New Jersey, Ohio, California, etc.; New Jersey reporting 106 associations in 1880; Ohio reporting the incorporation of 307 associations during the seven years preceding the report (1880); total estimated societies (1880), 3000 in United States, with membership of 450,000; and aggregate capital of \$75,000,000.

Experiments in colonization.

1880, *et seq.*—Formation of the New England Cooperative Association.

Revival of the Patrons of Husbandry.

Greatly quickened growth of cooperation in all lines.

Development of the Knights of Labor.

Organization of the Central Labor Union.

Formation of the American Cooperative Union.

Reports from all directions of new enterprises.

Thus far Dr. Newton, writing in 1886. If, however, he had written later, he would have had to add a less favorable outlook. The cooperative ventures of the Knights of Labor (*q.v.*) and those of the Patrons of Husbandry have almost wholly disappeared to-day. What endures to-day are only a few strong cooperative stores, and numerous, tho, as a rule, poorly managed and weak and small attempts at cooperative colonies and communities of many kinds. Coming now to details of the history, we pass over the system in the New England Fisheries as *Profit-sharing* (*q.v.*) rather than cooperation. The early attempts at insurance in Philadelphia will be considered under INSURANCE. The cooperative efforts of Owen, the Fourierites, and other communities will be best studied under COMMUNISM. The subject of cooperative credit is considered under BUILDING ASSOCIATIONS and COOPERATIVE BANKS. We therefore come, as the beginning of American cooperation proper, to the formation of the New England Protective Union. We shall consider first distributive cooperation and then productive cooperation.

Mr. John G. Kaulback, a wholesale grocer of Boston, took the initiatory step. A member of the New England Association of Mechanics and Working Men, he proposed to the members that they contribute a certain sum individually, purchase certain necessaries of daily consumption, and meet weekly to divide them. A so-called dividing store was opened. From this small beginning, step by step, the work went on until the year 1845, when the first protective union store was organized and began business. Some dozen or more persons with "faith in God and the right" thus began in an upper room over the Boylston Market, their first purchase a box of soap and one half box of tea. Out of this Working Men's Protective Union grew the New England Protective Union, which was organized January, 1847. The 12 local divisions thus organized, of which 10 were in Massachusetts, grew so rapidly that in 1850 there were 106 divisions. The membership in 82 of them was 5100, and the capital in 84 of them was \$71,800.36. By October, 1851, the number of divisions had grown to 403, of which 167 reported a capital of \$241,712, and 165 reported sales for the year of \$1,606,825. The success of the union was largely due to Mr. Albert Wright, the energetic secretary, down to 1850.

New England Protective Union.

Discord finally split the organization. The new branch took the name of The American Protective Union. The old organization showed, in 1855, 72 divisions reporting, with 4,527 members, an aggregate business of \$1,130,719.29. The decline set in during the next year. The new branch did a business, between 1853 and 1858, ranging from \$1,000,000 to \$1,536,000 per annum. In 1859, the board of government believed that there were 600 stores in operation. By this time the decline had begun in this branch also. The aggregate business for 1859 was only \$930,376.36. Both branches were soon practically defunct. The great majority of the local stores were gradually wound up, or passed into ordinary joint-stock concerns, or into private hands. The civil war put an end to most of the few that lingered on that far. A handful endured even that strain, and some live still, under new names generally, *e. g.*, the stores in Worcester, New Bedford, Natick, etc. During the war no general society for cooperation was in existence, but not a few local stores were opened, some very successfully.

From 1873 to 1875, the Patrons of Husbandry (*g. v.*), founded in Washington in 1867, developed cooperation.

In six months of 1873, more than 10,000 granges were formed. The membership doubled in 1874. At the meeting of the National Grange, in November, 1875, the secretary reported 24,290 granges, with a membership of 763,263. The minutes of the National Grange show, from the start, a discussion of various schemes of cooperation, with references to experiments actually made. The favorite method was an imperfect form of cooperation, in which each local grange resolved itself into a purchasing club, and the various granges of a State united to support a general agent, who, combining the orders of the scattered clubs, bought in large quantities at a considerable discount, and shipped by carload to the several granges at reduced rates. The business of these agencies became immense. Pennsylvania had an agency store in Philadelphia, which was filled from top to bottom with samples. The Ohio agency, in one year (1875), ran a business of a few thousand dollars up to "not far from one million," with a saving to the granges of \$240,725.40.

These business methods, however, led to losses, and the Rochdale system was widely developed. The rapid growth of the movement, however, brought on a reaction, and another order arose to develop the next wave of cooperation. This was the Sovereigns of Industry, a secret order with ritual founded in 1874, to do for the artisan classes what the Patrons of Husbandry were doing for the farmers. Its first president was William H. Earle, of Worcester, Mass., and its national organizer John Orvis. It, too, grew very rapidly. The second annual council reported 166 councils, with 20,000 members. In 1877, the National Council had reports from councils in 17 States and Territories. At first, the members of a local council used to club together in buying at a certain store, saving thus from 10 to 20 per cent. They would buy flour by the carload, saving from two to three dollars a barrel. A general distributing agency was established in Chicago, through which all local councils could procure goods direct, at cost. The General Council urged upon the order the establishment of cooperative stores on the Rochdale system, and clearly and accurately enunciated the principles and methods of that system in a plan which was printed for free distribution. This plan was somewhat adopted, but not generally, until many of the councils had suffered by loose and unorganized methods and dissatisfaction had set in. The movement had reached large proportions, 94 councils alone in 1877 doing a business of \$1,089,372. In Worcester a Sovereigns of Industry was erected at a cost of \$35,000. By 1880, however, the order had collapsed, though not a few stores in various parts of the Union still remain as a result of the movement.

The next great order to take up cooperation was the Knights of Labor (*g. v.*), organized in Philadelphia in 1869, but which became general only early in the eighties, and then grew with mushroom growth. The fourth plant in its principles declared for the "establishment of cooperative institutions, productive and distributive." Cooperation, mainly productive, was therefore early agitated by the Knights, and led to many attempts in all parts of the Union, but few, if any of them, with enduring success. The mushroom growth of the order

has been, after 1886, followed by a steady and rapid decline, and of their cooperative efforts scarcely anything endures. What exists to-day out of all these waves of cooperation are a few local and disconnected stores and productive companies. Some of these, however, are very strong and successful, and instances of them we shall name in a moment.

We pause now to consider the history of productive cooperation in America. The movements thus far noticed, with the exception of that of the Knights of Labor, were mainly distributive. The first productive association of which we have any record was that of the Boston Tailors' Associative Union, which was formed in 1849, but did not endure long. Dr. Newton in his article (see above) mentions similar attempts at shipyards in Baltimore (1865); in Boston (1866); a machine-shop in Philadelphia (1866); foundries in various cities—Troy, Albany, Cleveland, Cincinnati, St. Louis (1865-68); shoe manufactories in Lynn and North Adams, Mass. (*cit.*, 1868); a cigar manufactory in Westfield, Mass. (1866); a machine-shop in Greenfield, Mass. (1870). Says Dr. Newton:

"The most promising of these early experiments was the stove foundry of the Iron Molders' International Union. This was started in 1867, in Allegheny County, Pa., the 10,000 members of the union having been expected to become stockholders. The paid-up capital, however, proved insufficient in a critical moment—the oft-repeated experience—and the enterprise failed.

"The decade 1870-80 experienced a marked increase in the number of productive societies. In the mid-year of this decade, Massachusetts had 16 productive societies reporting to the State, and nine not reporting, tho' duly chartered. All but one of these had been organized since 1870. The 16 societies reporting gave an aggregate paid-in capital of \$114,210. The nine not reporting were incorporated for \$47,110. Other societies were known to exist. These societies were located in Lowell, Truro, Weymouth, Westborough, Chelmsford, East Templeton, Holyoke, Somerset, North Adams, Newburyport, Orange, Marlborough (2), Boston (2), Stoneham (2), Fall River (4), Lynn (4), Westfield (8). Their work may be classified as follows: furniture-making (1), chair-making (1), foundry work (1), manufacture of gas (1), dairy-work (1), cotton manufacturing (1), printing (2), the building of houses (4), cigar-making (5), boot and shoe manufacture (6). An illustration of their work may be taken at random in the Cooperative Furniture Company of Orange, which in 1879 sold chamber sets to the value of \$15,743.52. A very promising association was the Rochdale Cotton Manufacturing Association, of Fall River, organized in 1874, with a share subscription of \$125,000. This was the work of a philanthropic mill-owner, whose family took the largest amount of the stock. It had a short career. Ohio had a number of associations for manufacturing, but the cooperative feature did not long survive in the few societies that were successful. One of these associations had a capital, in 1877, of \$100,000, but lapsed into a joint-stock concern, votes counting not by persons, but by shares. . . .

"A number of these societies were the results of strikes. The strike at North Adams, *e. g.*, on the introduction of Chinese labor, led to the establishment of a cooperative shoe factory. A report says: 'The men speak with pride of their new feelings of self-reliance and freedom, as well as of the quality of their work.' . . . The Patrons of Husbandry were reported in the *Economist* of November 8, 1876, as having 730 manufacturing associations, whose capital ranges from \$200,000 to \$500,000; . . . 16 grist-mills, one of which produces 100 barrels of flour per day; . . . 3 tanneries and 6 smitheries.'

"The Sovereigns of Industry contemplated entering upon this field, and made some essays in it, *e. g.*, the Kingston Cooperative Foundry Company, in Kingston, Mass. Its members consisted chiefly of picked men from other foundries. It organized with a capital of \$8000. Details of the experience of this and other societies have vanished with the order."

This brings us down to the attempts of the Knights of Labor and the present time. The attempts of the Knights were most various and most widespread, including boot and shoe companies in Massachusetts, painters' and decorators' associations in Minneapolis, clothing companies, tobacco factories, plumbers' associations, printing companies, mining associations, etc. All these, however, as Knights of Labor organizations have come to grief, and only a few of them remain in any form. Nevertheless, not a few strong productive cooperative enterprises have secured enduring form.

Productive Cooperation.

Patrons of Husbandry.

Sovereigns of Industry.

Knights of Labor.

Says the Report on the United States of the (English) Royal Commission on Labor :

"The most successful cooperative enterprises of a productive character are those existing among the coopers of Minneapolis. Between 1874 and 1886 no fewer than nine associations have been formed there which conduct business on cooperative principles. As early as 1868 the experiment of renting a small shop and selling the product direct to the mills was tried by a few journeymen coopers; they allowed themselves the ordinary rate of wages, calculated on the piece system, and then divided the profits in proportion to the work done. A suspension of trade in the flour mills caused the discontinuance of the enterprise, and on its resumption in 1870, it proved a financial success, but a failure from the cooperative point of view, owing to the determination of the treasurer, who had secured a large contract for himself instead of for the firm, to set up as a master cooper. The rapid increase of the milling industry and the consequent influx of coopers to supply the demand for barrels caused the labor market in Minneapolis to become overstocked; the wages of coopers fell so low that the former co-operators decided in 1874 to renew their experiment. Having obtained the promise of a contract, the Cooperative Barrel Company was formally incorporated under the laws of Minnesota, and entered upon a prosperous career. There were 16 members at the outset, who were to be equal shareholders, and to receive a share of the profits in proportion to the work done by each. The membership increased rapidly, and by the spring of 1885 it had reached 120, besides 20 employees working for wages, while the paid-up capital amounted to \$50,000. The introduction of machinery in that year caused some members to retire, as there was no longer sufficient work for all, and the numbers have since stood at 90. The assets of the company are \$58,000 and the liabilities \$73,000, so that the net value of its property amounts to \$45,000, or \$500 for each member. About three fourths of the members are married, and nine tenths of the married members own their own houses, so that, according to the statement of the President of the Association, nearly all the members have property worth from \$300 to \$10,000. About 25 of them are of American birth, 35 are Scandinavians, and 20 Irish; the rest being of various nationalities. The other establishments have had a similar history; all have been more or less successful, tho in one case, that of the Twin City Barrel Company, the treasurer absconded with about \$75, and his defalcation resulted in a great loss of mutual confidence among the members."

Minneapolis Coopers.

Cooperative dairies have also had considerable development in the United States. In 1886 the combined business of the Massachusetts creameries amounted to \$500,000. Ohio possesses a number of these creameries and cheese factories; in the latter case the factories are generally rented to reliable tenants, who contract to manufacture the milk delivered daily into cheese at 75 cents for each cwt. Sometimes the dairy farmers allow the manufacturer so much for each hundred cheeses, and then divide the remaining proceeds. There are similar establishments in Iowa, and, indeed, in most agricultural districts.

Such are the great classes of cooperative enterprises in the United States down to the present time, except those which are cases of profit-sharing and building and credit associations, both of which are considered under their respective heads. The latter associations form, however, it must be remembered, by far the most successful form of cooperation in this country.

The present condition of cooperation in the United States is very difficult to state, owing to the utter lack of any national cooperative union or the collection of any reliable data on a large scale. Efforts at the establishment of a national union or bureau have recently been made, but with little efficiency. Many successful local cooperative undertakings are known to exist. Says Mr. N. O. Nelson, himself the founder and manager of perhaps the best cooperative enterprise in the United States, at Leclaire, Ill., a full account of which will be found under the head Leclaire, Ill. (writing in *The Outlook*, April 27, 1895):

Present Condition.

"In the United States cooperation is far behind England and France. Spasmodic movements have been inaugurated, but they have stranded on the rocks of credit or politics or low prices. The discoveries in business principles, which the Rochdale working men co-operators may be credited with making—namely, cash dealings, market prices, dividends on purchases,

and an ever-accumulating surplus—have been overlooked or ignored by the American wage-earner, who feels no need of small economies when wages are high and work abundant, and who has nothing to spare for a business venture when bad times leave him stranded. The Rochdale plan looks puny and prosy to open-handed Americans who do not understand its principles and its possibilities.

"But the start has been made. Genuine Rochdale stores are to be found in every part of the Union. Most of them are young and small, but there are some with a membership numbering from 1 to 2000, and sales as high as \$250,000 a year. Lawrence, New Bedford, and Springfield, Mass., Brattleboro', Vt., Trenton, N. J., Lyons, Ia., Olathe, Kan., Galveston, Tex.—all have prosperous and growing societies."

A letter from Mr. Nelson gives the following information in regard to some representative existing associations:

"The Lyons Cooperative Association at Lyons, Ia., grew out of the Knights of Labor, and was started in 1886; the initial subscribed capital being \$6,57. This store had in 1891 10 employees, 5 horses, 2 delivery wagons, and an annual retail trade of from \$60,000 to \$75,000 a year. They pursued the conservative policy of depreciating fixed plant, and paying 8 per cent. per annum on capital. Its capital was in 1890, \$20,720, the net profits, \$197; it owns its own store, and buys entirely for cash.

"At Trenton, N. J., a cooperative store grew out of labor disturbances in 1885, and started with 90 members. They paid up \$150 in cash, agreeing to pay 50 cents a week toward a full share. The store had in 1890, \$11,745 capital; \$90,440 sales; net profits, \$14,808; total sales for six years amounting to \$441,247; and in that period paid back to the customers \$60,000 in dividends and interest.

"The Cooperative Store of Allegan, Mich., was started in 1875. Its sales in 1890 were \$103,827. Sales are on the cost plan; the expenses and interest on capital amount to less than 5 per cent. on the business done.

"The Johnson County Cooperative Association, of Olathe, Kan., started business in 1876, with a capital of \$800. It had in 1891 a capital of \$105,000; sales of \$208,000, and net profits of \$15,722.

"The Texas Cooperative Association, of Galveston, Tex., started business in 1879, with a capital of \$250. It had in 1890 a capital of \$80,945; 709 shareholders, and divided \$14,798."

The latest statistics in regard to some of the representative cooperative stores in this country are as follows—Arlington Cooperative Association, of Lawrence, Mass. (central stores and two branches, with grocery, fuel, and dry goods departments):

CASH STATEMENT FOR FORTY-SECOND QUARTER ENDING MARCH 31, 1895.

RECEIPTS.	
January 1, cash on hand.....	\$5,161.88
Sales.....	72,336.58

Farmers' and Mechanics' Exchange, of Brattleboro, Vt. (commenced business April, 1877):

Business in 1894, \$83,400; shareholders, 507, at \$5 a share.

Recently the various farmers' organizations have made various attempts at cooperative purchasing, etc., with varying success, and too recently to show permanent results. As an example, the secretary of the Farmers' Supply Company reports in January, 1894:

“We point with pride to our first 11 months' trial under the most trying financial conditions possible. We handle nothing at present but coal and groceries. In 11 months we sold \$4327.35 worth of groceries and \$3864.92 worth of coal, at a cost to us of \$745.50. Our gross profit was 17 per cent., and cost of handling 9 per cent., leaving a net profit of 8 per cent. to shareholders on every dollar sold, which gave us 95 per cent. net profit on our average paid-up stock for the 11 months. In round numbers we sold to shareholders \$3000 and to outsiders \$5000 worth of goods. In making dividends, we pay 10 per cent. on paid-up stock and 16 per cent. on each dollar's worth of goods purchased by a member, besides making a donation of \$70 to one of our members, and carrying \$50 over to next year. We paid cash for all we bought, and sold in the same way. We started with 31 members, and we now have 79.”

The present popular but not usually effectively organized cooperative efforts are at cooperative communities. A few of these, notably the one at Tennessee City, Tenn., are strong. Most of them are very weak and ephemeral. They are, however, best studied under communism.

IV. METHODS OF COOPERATION.

No one can study the history of cooperation, particularly in England, without discovering two almost contradictory methods and ideals at work.

Says Beatrice Potter (Mrs. Sidney Webb), the author of *The Cooperative Movement in Great Britain*, in a tract on *The Relation between Cooperation and Trades-unionism*:

“On the one hand, we have associations of consumers, such as the corn mills, the stores, and the wholesale societies, who together transact over 95 per cent. of the cooperative trade of the country. On the other hand, we have a few associations, not of consumers, but of producers, such as the Eagle Brand Boot Works, at Leicester, or the Slipper Makers' Society at Newcastle. The idea of the associations of consumers is that of the cooperative or socialist state—the management of industry by salaried officials for the profit of the whole community. The ideal of the rival form of industrial cooperation consists of groups of self-governing workers owning alike the instrument and

the product of their labor, and competing for profit in the markets of the world. These ideals appear to me antagonistic to each other, and mutually exclusive. But, however that may be, they most assuredly present separate problems, and are as different in their limitations and their advantages as they are in their aims.”

These two forms of cooperative industry have each had earnest supporters, tho the ideal of the Association of Consumers has had much the larger following. The Association of Producers was, however, the earlier ideal, and has been strenuously advocated to the last by such men as E. V. Neale and Thomas Hughes. Said Mr. Neale at the Congress of 1886:

“The original pioneers looked forward to self-employment, and the many advantages that might thus be brought within their reach, as the goal to be attained through the accumulation of the profits on their own purchases. Their successors, to whom the idea of self-employment has melted into the haze of a distant future, have too commonly got to look on the profits on their purchases as so much addition to their ordinary income; and have even been disposed to measure the benefits of the store by the amount of this addition—the actual dividend on their purchases—without caring to inquire closely how much of it is legitimately earned in the ways as specified above, and how much has come out of their own pockets by arbitrary additions to the prices of the goods sold. These departures from the original idea have produced a reactionary movement, a tendency to place the benefits of the store not where they really lie in the collective action which they make possible, and the educational and recreative resources that the members may obtain by their union beyond what they could secure individually, but simply in the power of getting what they want at a cheaper rate, by selling to themselves as nearly as may be at cost price.”

On the other hand, Mr. Thomas Tweddell said in his inaugural address at the Congress of 1894:

“To my mind the most melancholy episode in the whole history of cooperation was that in which Messrs. Neale and Hughes, a year or two ago, took their farewell of the movement, pointing out how they had striven to direct it, how they had held this ideal of the self-governing profit-sharing workshop aloft, and how cooperators had resolutely refused to follow. I respect these leaders, one of whom has since taken a permanent farewell of us, and crossed that 'bourne from which no traveler returns.' I respect them from their consistency, their courage, their devotion. But while conceding to the fullest extent that respect which is their due, we may be permitted to doubt whether, after all, the theory of the few has been consistently right, and the practice of the many has been persistently wrong. I incline rather to the belief that the imagination of the movement has been captivated by a beautiful ideal presented with all the charm that eloquence and earnestness could lend to it, but which, if experience is any guide, is delusive and impracticable, and which, like the fabled treasure said to be buried beneath the rainbow, ever recedes as you pursue it.

“Originating in the Utopian dreams of French socialists like Duchez, Fourier, and Louis Blanc, this idea was introduced to England by the Christian Socialists about the year 1849, and was made the subject of much earnest and self-sacrificing propaganda. The theory which they endeavored to enforce, as described by one of their number, was 'the conception of workers as brethren—of work as coming from a brotherhood of men associated for their common benefit, who therefore rejected any notion of competition with each other as inconsistent with the true form of society, and without formally preaching communism sought to form industrial establishments communistic in feeling, of which it should be the aim, while paying ordinary wages and interest, to apply the profits of the business in ways conducive to the common advantage of the body whose work produced them.' This beautiful and captivating ideal, which lends itself so freely to platform declamation, and is so admirably adapted to win acquiescence from a sympathetic audience, has been sedulously preached from the year 1849 until now, and with what result?

“From a work published recently by Miss Potter (a name that will live in our movement, although the lady

herself has recently abandoned it)—from Miss Potter's volume, which ought to be read by every cooperador, I quote the following:

"Of some hundreds of associations of producers known to have existed before 1870 only three remain. And passing over the dead bodies of some hundred societies registered from 1870 to the present day, let us rapidly survey the actual existing societies which have been, or claim to have been, organized in the interests of the producer. We take as a basis of our investigations the list of cooperative societies published in the Report of the Central Board for 1890. First we must eliminate from this list the productive departments of the wholesale

societies, and the corn mills and baking societies avowedly organized in the interests not of the producer, but of the consumer. Secondly, we must cast out as unworthy societies such as Mitchell Hey, registered under the Industrial and Provident Societies Act, but which have practically become joint-stock associations, participating neither profit nor government with the workers. Thus, from a list of 106 separate societies, with a turnover of £2,308,028, we are reduced to 74 manufacturing and 5 agricultural associations, with an aggregate turnover of £455,477. Of the 74 manufacturing societies 20 are not in working order. . . . We have therefore a remainder of 54 manufacturing associations and 5 agricultural associations. . . . Now this cursory examination of all the present forms of cooperation that represent even in the vaguest and most remote degree the aspirations of the Christian Socialists, reveals one all-important fact. The ideal advanced by the Christian Socialists, and constantly forced by the individualist school of cooperators on the attention of the stores and the wholesale societies—this fair vision of a brotherhood of workers, of a self-governing cooperative workshop, in which the manager and committee are to be elected by the members from among their own body—vanishes into an indescribable industrial phantom, which, unlike the texture of real existence, becomes more and more imperceptible with the application of the magnifying glass. For when we look carefully into these 54 societies, we discover that over one third of the trade is transacted by establishments which are simply capitalist associations adopting some scheme of profit-sharing. It is true that a small proportion of them compel or encourage workers to become shareholders. But in all cases, without a single exception, outside shareholders hold the balance of power. If we turn our magnifying glass from off the bulk of the trade on to the majority of the societies, we lay bare a positive evil instead of a harmless self-delusion. So-called associations of workers are constantly resolving themselves into associations of small masters, into an industrial organization which is perilously near if not actually included within the sweating system, or we discover associations of workers so indifferent and skeptical of the advantages they offer as employers that they prefer the security of private trade and leave the cooperative workshop open to hirings. Or, again, we watch associations beginning with fervor and success, but surrendering in the course of a year or two at discretion to a dictator; or we see farsighted-promoters carefully securing their own position as irremovable managers. Thus these 54 associations, with a trade of £449,228, disperse in various directions, and we are left with our microscope pointed at eight minute specks on our industrial system, as the net result of 45 years' agitation in favor of the self-governing profit-sharing workshop."

"In this hasty retrospect, I think I have shown that that form of cooperation bequeathed to us by the Pioneers is the only one which has stood the test of practical experience, the organization—not of capitalists, not of workers, not of sellers, but of consumers, and the reasons why it has succeeded when other forms have failed are because

IT RESTS UPON THE WIDEST SOCIAL AND ECONOMIC BASIS.

"In our discussions on this subject we are too apt, I think, to commit the mistake of assuming that the worker and the consumer are two distinct and conflicting agents, or, in other words, that the community is divided into two great classes, production being the function of the one and consumption that of the other. Such a classification is absurd and untrue. We may divide the human race on the basis of sex, or of nationality, or of color, because such divisions are absolute; but we cannot divide it into producers and consumers, because one class embraces and includes the other. As

well divide the race into human beings and females. Take away the human beings, and where will the females be? And so take away the consumers, and where will the producers be? In making consumption, therefore, the basis of their organization, the Pioneers selected the widest possible foundation upon which it could rest."

The same result is the opinion of Mr. N. O. Nelson, in this country. He says, in his *Outlook* article:

"The most feasible method of getting into cooperative manufacturing is through the cooperative store. Store-keeping takes less money to start with, is simpler in its operations, and when once under good headway easily accumulates capital for factory plants. . . . Working men who really want to better the condition of their class should get together, familiarize themselves with the working details, and make a beginning in a small way. The difficulties to be encountered are not so much the business itself as the people's indifference. Where as many as 50 can be gotten together and imbued with the proper spirit a safe start can be made. Some members can pay their shares in full, and others 50 cents or \$1 a week. Some vacant room can be rented cheaply or obtained for nothing; the work can be done evenings by volunteers or by some one out of work for small pay. The beginning should be confined to staple articles of food, and books should be kept under advice of a friendly bookkeeper. Care should be taken to keep the expenses so proportioned to the business that a fair net profit will be made from the start. Purchases and sales should be rigidly cash, and prices should be the same as at the neighboring retail stores. Every one of the 50 should be a missionary to explain the plan to his friends and get them to join. Members should loyally do all their trading at the store, even at some inconvenience. Undertaken in this way, a cooperative store can be started anywhere and be assured of success."

There is, however, another view. The *Labor Copartnership*, the publication of the Federated Productive Societies, reports 120 in the Federation, a large part of which are well established, strong and healthy. They are doing very active propagandist work; about 30 of the largest ones have formed a guarantee company to receive loans at 4 per cent., to be lent under careful conditions to productive societies. The Federation has frequent meetings, similar to the Cooperative Union, district meetings and congresses. They do an enormous amount of lecturing and stimulating and advising, especially through H. H. Vivian, Thomas Blandford, and N. Williams, who are devoting themselves entirely to this program. George Jacob Holyoake is President of the Federation, and E. O. Greening, of the Agricultural Association, and J. Greenwood, of the Hebden Bridge Fustian Manufacturing Company, are active promoters. Independent production is more difficult to start and make successful in the competitive field than the stores. But in a good cooperative field, as there now is in England, many are unable to see any constitutional difficulty in the way of such associations, big and little, spreading on an extensive scale. They believe the conditions of success to be now all present in England, and that the rapid growth which has occurred in the last two years will henceforth be continually accelerated.

Perhaps one of the most needed things in making cooperation a success is not to claim it as a substitute for other social reforms, but to claim for it a place in social reform. In England and Belgium they are rapidly learning this lesson. Said Beatrice Potter (Mrs. Sidney-Webb), in a paper read at a conference of trade-

How to Commence.

union officials and cooperators at Tynemouth, August 15, 1892 :

"I contend, therefore, that the cooperative and trade-union movements are the necessary complement of each other. In the cooperative society or the municipality the citizen consumer unites with his fellows to control and manage for their common benefit as much as possible of the industry which supplies their needs. Their aim must necessarily be to obtain good articles at a low expense of production. But as they themselves are also producers, it is easy for

them to realize the truth of Owen's great principle, that the community is in the long run injured, not profited, by any beating down of the standard of life of its members. These same citizen-consumers combine, therefore, among themselves in a second organization, according to industries, in order that in no case may the heedlessness of the consuming majority depress the condition of the minority in which any one set of producers is bound to find itself. Without cooperation, voluntary or municipal, there is no guarantee that any industry will be carried on for the public benefit; without trade-unionism there is no security that this public benefit will not be made a source of injury to the minority of producers. Combinations of workers may, therefore, be regarded as a permanent element in the democratic State, whether the control over industry be in the hands of voluntary associations of consumers or in those of the State or municipality itself.

"My conclusion, therefore, is that trade-unionists and cooperators are in duty bound to swell and maintain each other's organizations in every possible way. The artisan cooperator who is not also a member of his trade society is a traitor to all the essential principles of the cooperative faith. The trade-unionist who is not a cooperator is hugging his chains as a wage-slave without taking his part in the struggle toward the democratic control of industry. And both trade-unionist and cooperator, let me add, are forgetful of their rightful duties and responsibilities unless they are also active citizen politicians, eager to secure their full share of control over those branches of cooperation in which the proper unit of administration is not the store or the trade society, but the municipality or the State."

V. ARGUMENTS FOR AND OBJECTIONS TO COOPERATION.

The argument against cooperation is never against cooperation as an ideal, but simply against it as a practical method of social reform. On this line the opposition to cooperation has been varied and often strong; the argument, however, being different against different forms of cooperation.

1. Against distributive cooperation it has been claimed (tho in part, as we shall see, unjustly) that while it enables the cooperative consumer to obtain lower prices and save some of the profits that would otherwise go to middlemen, it does not tend to raise wages, and may even tend to lower wages through the interest the purchasing cooperators have in purchasing as cheaply as possible.

As a matter of fact, cooperation has not been proved to pay the lowest wages. The cooperative Wholesale Society in England is an agent for 1,000,000 cooperators, and pays union wages; so, with the rarest exceptions, do all cooperators. The argument, therefore, that cooperation lowers wages must be given up.

Consumer and Producer. Says Mr. N. O. Nelson, of St. Louis, upon this point: "As the consumer and producer is the same person, he is benefited as well by economy in his purchases as by profit on his work. When buying in a competitive market, there is no other practical method than to buy the cheapest for given quality. Such buying does not imply expedients or sharp practices. There is no apparent reason for cooperative buying depressing prices. So far as consumers are producers, if the purchase price be lowered, so is the selling price. The function of the middleman, to get a profit for himself, is eliminated, because the profit goes to reduce

the cost to the consumer. With rare exceptions if any the cooperative factories pay union wages, and the operative can in every instance make himself a cooperative consumer. The English Unionists do not now claim that cooperation lowers wages. They did so formerly only in furtherance of the union cause, as the only means of improving the working man's condition. Tom Mann is now lecturing for cooperation, and the union congresses of the last few years have unqualifiedly indorsed cooperative stores and factories. The sweating charge against the Wholesale is entirely unfounded."

2. On the other hand, it is claimed that productive cooperation tends either to develop little companies or groups of producers competing against each other, or, if these little companies combine into one whole, to develop a monopoly which is Competition, either against the community, or, if large enough, to include the whole community, is socialism and not cooperation. Says Beatrice Potter (Mrs. Sidney Webb), in her tract *Cooperation and Trade-Unions* :

"Let us suppose, for instance, that the cooperative corn mills in the north of England were owned and managed, not by associations of consumers, but by the workmen now employed in each of them. It is clear that there would, in that case, be no room for the present Millers' Trade-Union, and strikes against employers would be unknown. But should we by this social revolution have achieved industrial peace? Our self-governing corn mills would be forced inevitably to adopt one of two courses. The workers in each mill might, in the first place, preserve their entire independence of the other mills, and they would all compete with each other for the custom of the community. This course is, in fact, the one pursued by such associations of producers as already exist. But, unfortunately, this unrestrained competition inevitably leads, in bad times, to the lengthening of the hours of labor of the associated producers, and the reduction of their remuneration. Profit disappears, at any rate for a time, and it becomes a question of working longer and for less than before, in order to avoid running behind-hand and seeing their whole capital disappear.

"But, on the other hand, the self-governing workshops, if they ever came to be the typical form of cooperative industry, might be wise enough to avoid this disastrous competition by learning a lesson from the American capitalist. We might, in fact, have a 'ring' of flour producers against the consumer. A few years ago there was actually an attempt to form a flour syndicate in the north of England, which broke down through the determined opposition of the mills owned by associations of consumers. If these mills had been owned and governed by the workers in them, they might, in order to avoid the horrors of unrestrained competition, have fallen in with this arrangement. Instead of the spectacle of the sweating system, we should then have before us a gigantic 'ring' or 'combine' of capitalist workers, associated to keep up prices against their customers. We should, indeed, have done away with the Millers' Trade-Union, with its modest and legitimate desire to maintain the standard of life of its members. But we should have created in its place a body of monopolists, exploiting the public for their own private gain. Industrial conflict would have been replaced by industrial oppression."

But this, again, is argument not against cooperation, but against its misuse, and any social reform may be misused. Mrs. Webb in her tract argues not against cooperation, but for the necessity of combining trade-unionism with cooperation—a combination which is, fortunately, rapidly on the increase in England. In the great miners' strike in England last year the miners were very greatly helped by the large funds they had to draw from in their shares and deposits in the cooperative stores. The tendency of cooperation to develop little competing groups of cooperative producers is a very real one, but is an evil only incident to the beginnings of cooperation, and its cure is not less cooperation, but more cooperation.

3. A stronger argument against cooperation is that it so fixes the mind of investors and co-operators on saving or earning a few cents that he forgets questions of much larger economic importance. Says Beatrice Potter in the tract quoted above :

"It would be a fatal error if the million members of cooperative societies allowed their comparatively small interests as dividend receivers for one moment to divert their attention from their much vaster interests as wage-earners and citizens. The dividends of a cooperator amount on an average to about £3 a year, or just about a farthing per hour on his wages. A 'good' cooperator, dealing pretty constantly at the store, will make perhaps double this amount, or a halfpenny per hour of his working time. Now I need not remind you how very easy it is to lose a halfpenny per hour in wages for the want of a strong trade-union. Take, for instance, the Amalgamated Society of Carpenters, with its 500 branches all over the kingdom. Their standard rates of wages vary from 5d. per hour in some towns up to 9½d. per hour in others—a difference equal to no less than 18 times as much as the average cooperator makes out of his store. In a score of towns last year the carpenters gained a rise or suffered a fall of a halfpenny an hour on their wages—more than they stood to gain in cash if they could have suddenly sprung at one bound into as successful cooperators as the men of Durham themselves. . . . Cooperators must not, in their zeal for their own movement, lose sight of the vital importance of maintaining, all along the line, the dyke of the standard rate of wages. If the cooperative artisans in any town lag behind their fellows elsewhere, even to the extent of an advance of a farthing an hour which might have been gained by strong trade-unionism, they will probably have lost as much in actual cash by the end of the year as they will have gained by all their devotion to the cooperative store. The engineers at Keighley, for instance, a strongly cooperative town, are earning at least 10s. a week less than the engineers at Manchester; a fact which can, I think, only be accounted for by the superior capacity for trade combination exhibited by Lancashire mechanics. It will hardly be maintained that the £5 a year dividend of the Keighley 'good cooperator' is equivalent to the £26 a year additional wages earned by the Manchester 'good trade-unionist.'"

Yet this, again, is no argument against cooperation, but simply for (as Mrs. Webb uses it) a combination of cooperation *with* trade-unionism. Cooperation may not accomplish all things, but a penny saved is a penny earned, and trade-unionists in England have learned that they cannot afford to sneer at the millions of pounds in the English cooperative movement, gained by saving pennies.

4. Perhaps a still stronger argument against cooperation is that it not only is in danger of making men forget larger economic interests, but tends to positively develop a competitive mercantilism, instead of a truly socialistic spirit. There is some truth in this; nevertheless, it is also true that cooperation tends to develop mercantilism less than does the ordinary life of commerce, and hence is a step in advance. Cooperation does not claim to introduce the ideal at once, but only to be a long first step toward that ideal.

5. The main argument against cooperation, as applied to the United States at least, is that it is almost an impossibility to introduce it successfully to-day except through the form of profit-sharing, against which form there are especial arguments. (See **Difficulties. PROFIT-SHARING.**) Cooperation, unless introduced by some large and established firm, some schools of thought claim, can scarcely expect to succeed in the United States. The reason is that in the

United States, as, perhaps, nowhere in the world, have we developed large, powerful corporations and monopolies. Nowhere is competition so organized as in the United States. With mills, stores, and all forms of business carried on by these gigantic corporations and monopolies, it is almost impossible for the small cooperative store to successfully compete. Against corporations able to run a year or more at a loss, in order to run out the small venture, small cooperation is helpless. Too often, too, these corporations do not need to run out the small venture. Small cooperative ventures too often run themselves out. They can rarely be well managed, because good managers can get larger salaries than the small venture can afford to pay, and even when well managed, the small venture cannot buy, or manufacture, or sell on a small scale so cheaply as the corporation on a large scale. Small cooperation is, thus, often hopeless, swallowing up the hard-earned money invested in it, and sometimes, in spite of the best intentions, becoming a veritable sweating den, simply because of the inability of the small venture to compete with large stores and yet pay living wages.

This, we say, is usually the case, but not always. Where a small cooperative venture is fortunate enough to secure a good manager, where it can secure some capital, where there is a community or a body of working men willing to support it, where there is willingness and determination to carry it through, then in trades and under circumstances where the competition is not too intense, the cooperation may succeed. Such cases are by no means wanting in the United States, tho exceptional.

One must not be misled by the success of the English movement. In the first place, the foundations of that success were laid before business was so monopolized as it is to-day by large corporations, while even to-day in England monopoly is not so developed as in the United States. Secondly, it must be remembered that 95 per cent. of English cooperation is consumptive, not productive—in other words, the least beneficial form of cooperation to the producer. Thirdly, some so-called cooperative successes are not cooperative at all, but profit-sharing, which is a very different thing. Even in England, Sidney Webb says (in his tract on *English Progress toward Social Democracy*) :

"Less than one four hundredth part of the industry of the country is yet carried on by cooperation. The whole range of industrial development in the larger industries seems against it; and no ground for hope in cooperation as a complete answer to the social problem can be gained from economic science. It fails to deal even with the real elements of the case. It may claim to obviate competition; but, as Mill himself quotes, 'the deepest root of the evils and iniquities which fill the industrial world is *not* competition, but the subjection of labor to capital, and the enormous share which the possessors of the instruments of production are able to take from the produce.' Cooperation can make no real defense against the continuance of the exaction of this 'enormous share'—rent and interest—the continued individual enjoyment of which it, indeed, actually presupposes. It affords a valuable moral training, a profitable savings bank for investments, and a temporary means of interest resting the worker in the industrial affairs of his country. But ordinary joint-stock investment is now rapidly outgrowing it, and is already 160 times as great as cooperation. Now even the most enthusiastic believer in the virtues of association will hardly expect salvation merely from a *régime* of joint-stock companies; and this, and not co-

operation, is clearly the line in which our industrial development is rapidly traveling, so far as all large enterprises are concerned. The final goal of many industries is, moreover, obviously not the cooperative society, but the municipality. Nearly twice as much capital is already invested by town councils in a single industry (gas supply) as the whole 12,000,000 of the accumulations of the 1500 cooperative societies. A larger extension of 'municipal industry' is made every year than the progress, great as it is, of the cooperative industry. Already, where there is most cooperation, there is also most municipalization."

But this statement in part answers itself. It shows that cooperation and municipalization and socialism can develop together. In Belgium, as we have seen, cooperation practically supports the socialist movement and gives it an organized strength, perhaps greater than that of any other country. In England, trade-unionism, socialism, and the cooperative movement are coming to see that they are natural allies, and can be of the greatest benefit to each other. Mr. N. O. Nelson writes:

"There is, probably, nothing that has been so great an aid to the growth of the socialistic and radical reforms now being actively and successfully prosecuted in England, as the education which a million and a quarter of cooperators have received in the value of workers' mutual operations, and the feasibility of self-help. There is one pre-eminent value in cooperation as compared with reforms, which must be inaugurated by political methods. The former can produce some available and influential results at once, and continuously; the latter must do an enormous amount of political work before a majority can be persuaded and stirred up to final action, and of course many reforms fail altogether for lack of persistence.

"As to the 95 per cent. of cooperators who are merely consumers, there is no difference whatever between a 10 per cent. dividend on purchases and a 10 per cent. dividend or increase in wages. There is really more opportunity for education in connection with a cooperative store than a factory. In the factory, it must be in the main a one-man power, each man working in the same automatic way that he does for a private employer. In a cooperative store there is greater freedom; there are elections; there is service on committees; there are meetings; and also, as there may be in any cooperative association, libraries, reading-rooms, lecture courses and the like.

"While cooperation is greatly preferable to profit-sharing in the technical sense, it is nevertheless true that profit-sharing is cooperative to a large extent. Its chief objection is, that it does not introduce democratic responsibility in the selection of managers and the conduct of the business, and is dependent solely on the initiative and friendly disposition of a single proprietor or corporation stockholders.

"The recent business history of this country goes to show that enormous combinations are palpable failures; witness the Cordage, National Lead, Cotton-Seed Oil, and numerous other great aggregations. All of these have actually lost money. The reason for this, which was not at first apparent, is, that the attempt to run at many different points and for many different markets, under one head, does not get sufficiently careful attention to the details of operations. It will probably be found that a single factory of fairly good dimensions and self-contained is the most likely to succeed; and a decided advantage would be gained for it if, besides having the careful personal supervision of its chief owner, it also had the concurrent interest of all of its workers. The enormous retail stores are not necessarily, nor probably, disposed to sell any lower than they need to; and it is a fact that they make very handsome profits. A cooperative store, while it would have a much harder time getting started in a city

Small Stores large enough to have these large and well-established retail stores, would nevertheless be perfectly able to compete with them, when once established.

Practical. For apparent reasons, it is much harder to start a dry-goods or drapery store than in the smaller goods, such as groceries, meats, shoes, furniture, and the like. In all considerable cities there

are large stores; yet there are a multitude of small stores and shops of every conceivable sort. It would probably be found, too, that the big retail stores of any large city do not supply the inhabitants of that city and vicinity with anything like the hundredth part of the goods of all kinds consumed by the inhabitants. There is plenty of room for cooperative stores or factories, if, as a matter of fact, they have any economic advantages. If Mr. Brassey believes that £5000 a year insures a more competent manager than £300, I venture my opinion, as a business man of 25 years' experience, that he is mistaken. It is more frequently the case, that the larger the price the less the service that is actually rendered. There is a great deal of pure fiction and sentiment about a large part of the few high-priced salaries paid in the commercial world.

"Profit-sharing, introduced by wealthy manufacturers, is, by no means, the only way in which cooperative factories can be started. It is, in fact, practicable to start them just as nearly all other factories have been started, by beginning in a small way. The advantages of a large and well-equipped factory over a small one are not so great as may be supposed. The large manufacturer has many purely extravagant ways, which the small manufacturer does not indulge in. The best paying planing mill in this city [St. Louis], year after year, is the Mechanics, which, while not cooperative in the true sense, was started entirely by striking workmen on capital which they had scraped together of their own, and the stock is still mainly held by the men who work in the factory. Other planing mill masters here admit that they have the advantage, and make more money than any other mill in the city. A cooperator, who is at one and the same time a member of a cooperative store at which he buys his goods, and a member of a cooperative factory, gets (not quite, but) nearly all he produces. What he pays in taxes which should, by right, be secured from land value tax, is about the only thing that he loses; and he gains besides a very great advantage over the mere members of a trade-union."

Barnard (1881); *Manual of Distributive Cooperation*, by Carroll D. Wright, in Massachusetts Labor Report, 1885.

Revised by N. O. NELSON.

COOPERATIVE AGRICULTURE. See COOPERATIVE FARMING.

COOPERATIVE BANKS may be defined as cooperative organizations for mutual financial aid. They are organizations mainly of people possessed of little or no capital, and with limited incomes from wages or any other source, whereby they can put their small savings together and create a fund from which the members can borrow at low rates of interest.

In the United States such banks are usually spoken of as Building Associations, and are considered under that head, but it must not be forgotten that these associations are truly and not seldom are called cooperative banks, and that their special and marked development in this country make the United States one of the pioneer countries and chief homes of this form of cooperation. Apart from the building and

loan associations of the United States, however, Germany is the classic home of cooperative banking. Schulze-Delitsch and Raiffeisen are the two great founders of the movement, tho there existed some germs of the idea before their time.

In this, as in so many other things, China claims to be the originator, and Mr. Wolff, in his *People's Banks: a Record of Social and Economic Success*, finds other germs in the early banks of Italy, in some of the early communities among the German artisans who were taken to Russia to develop the trades there. As early as 1830 the German Gail (*q.v.*) proposed to fight capital by putting together the pennies of the poor.

But the ones to really develop cooperative banking were Schulze-Delitsch and Raiffeisen. Of these two men, each commencing his work without the knowledge of the other, Raiffeisen seems to have begun **Beginnings.** slightly the earlier, and to have developed the more strictly cooperative system; yet Schulze was the first to gain for the movement popularity and general following.

Schulze-Delitsch (*q.v.*), a prominent German Liberal and a man of some wealth and position, was deeply moved by the sufferings of the poor, in the days of the Revolution of 1848, and devised his system of cooperative banking for their relief. In conjunction with his friend, Dr. Bernhardt, of Eilenburg, he commenced his work among the joiners of Delitsch and the shoemakers of Eilenburg. He first formed simply a sort of provident fund, but established his first credit association in 1850. His ideas and example took root and found a large following. In 1863 he was opposed by the Socialist Lassalle (*q.v.*), and in several debates before working men's organizations Lassalle carried the audience with him against Schulze-Delitsch, whom he considered a reactionary Liberal. Yet Delitsch adhered to his work, and when he died, in 1883, he saw a network of his banks all over Germany and in adjoining countries. Of the exact nature of his system and of its status we shall speak later; meanwhile, we turn to the system of Raiffeisen.

F. W. R. Raiffeisen (*q.v.*), in Westerwald, began his work by establishing a cooperative bakery, and then a cooperative bank in 1849. It had only a capital of £300. Contesting against great odds, his system was little known till 1874, but before his death, in 1888, "Father Raiffeisen," as he was called, saw his system a distinguished success.

The following gives the essential points of difference in the two systems:

The Schulze-Delitsch credit associations put the *lender's* interest foremost; Raiffeisen, on the contrary, places the *borrower's* interest as the keystone of his system. He aims at social benefit, not at business profits. Every member joining one of the Schulze associations is expected to take one share valued at from \$40 to \$125 (each association determining the value of its shares). This share may be paid for in small instalments. The shares draw dividends ranging from 1 to 30 per cent. Some associations have declared dividends of nearly 60 per cent. This is gained by charging a somewhat high rate of interest. Loans are only made to members and are for short periods, never more than 90 days. As security, mortgages, pledges, bills, and surties are taken. These associations are managed by a well-paid committee whose salaries are increased by commissions based on the amount of business done. In order to increase their commissions, a committee often takes bad securities. In 1892 the as-

sociations borrowed about one fourth of this amount, mostly from private individuals.

The Raiffeisen loan banks were established to assist borrowers, and at the same time to free the small agriculturists from the merciless grasp of usurers.

Raiffeisen offered to supply the peasantry with money if they would subscribe to his rules. As his aim was to benefit the poorest classes he exacted nothing from those joining, and as most members were agriculturists, he made long credits the rule. Each bank membership is confined to a small district. Within this district members are elected with great care and discrimination. No difference is recognized between the poor and rich except that the latter are allowed to take the brunt in the administration. There is an executive committee consisting of five members and a council of supervision consisting of six or nine members, according to the size of the banking society. None of these officers receive a cent of remuneration. Only one man connected with a bank is paid, viz., the cashier, and he has no say whatever in the employment and the distribution of the money. All banking in the ordinary sense is strictly forbidden. The banks are *loan* banks and their sole instrument is credit. No dividends are paid. All profits go into a reserve fund, which is used to meet deficiencies or losses or it is voted to some public work or charity. Money is loaned only to members, and no request for a loan is granted until after a careful examination is made into the object of the loan, whether it is economically justified, and if found to be so the applicant for a loan is never refused. When the money is granted it must be used for the specific object for which it was requested. The rate of interest usually charged is 5 per cent. The banks obtain their money from various sources, paying from $\frac{1}{2}$ to per cent. They have more money than they can use as their reputation is excellent. In the 30 years of their existence neither member nor creditor has ever lost a penny. The lending is on character, no pledges or mortgages are taken as security, but simply a note of hand backed by one or two other members. It is thought by many that one of the strong points of these *loan* banks is that they are based on the *unlimited liability* of members.

In both the main object is to found an association which grants credit to persons who would otherwise scarcely be able to procure it, except at an exorbitant rate on the security of funds composed of small regular contributions made by all the members. Before the passing of the law of 1889, loans were sometimes made to non-members, but the law forbade this extension of the business of the associations on the ground that it destroyed their cooperative character. Since 1889 also the liability of the members has been no longer universally unlimited; but according to Dr. Crüger experience has shown that associations with limited liability have not always proved able to procure the necessary capital. On the whole, he regards it as probable that, in the future loan associations which do not possess any very large capital will be organized on the basis of unlimited liability, unless local circumstances determine them to adopt the contrary principle. The agreeing in their main object, the Schulze-Delitsch and Raiffeisen banks differ considerably in other details. The former admit members of every class, and think this safer, since it is improbable that a demand on the bank will occur in every industry at once; the latter limit their advantages to agriculturists. The former charge high interest (8 to 12 per cent.), and pay high dividends, with salaried officers. The latter charge low rates and have no salaried officers, and claim to be more ethical, while the former they consider merely commercial.

A connection between the associations, however, is maintained by means of the Central Agricultural Bank for Germany. The General Secretary's Union, presided over by Dr. Raiffeisen until his death, and since then by his son, aims to extend the system. The firm of Raiffeisen & Co. has been founded to supplement the funds of the association, and render them independent of subsidies hitherto granted by the Prussian Ministry of Agriculture. The firm publishes a journal, *The Cooperative News (Genossenschaftsblatt)*.

The Schulze-Delitsch and Raiffeisen systems are not, however, the only ones in Germany. Mr. Wolff mentions, besides the Buernverein or cooperative associations of the Roman Catholic Church, which do not a little at supplying credit, the Haas, Westphalian, Franconian, Posen, and Broich banks.

In 1889 a general German agricultural cooperative union was established, and gave a great impetus to agricultural cooperation.

The Two Systems.

The total number of cooperative credit associations in Germany, exclusive of the Bauernverein, is some 4800, with 500,000 members, and a capital of from 100 to 125 million dollars. Financial statements are published for 1076 out of the 4401 societies, showing that in 1891 the sums advanced, including extensions of loans previously granted, amounted to 1,561,610,000 marks (£78,080,000) as compared with 1,641,574,191 marks (£82,079,000) in 1890, representing an average of 3035 marks (£152) per member in 1891, as compared with 3111 marks (£156) in 1890.

On May 1, 1891, 3746, or about 95.8 per cent. of the whole number of credit and loan associations were based on the principle of unlimited liability; in 148 the liability was limited; while in 18, founded by Herr von Broich, there was an unlimited liability to be called upon to make subsidiary payments. The number of bankruptcies among loan associations between 1876 and 1886 was only 36.

With regard to the Raiffeisen banks, Dr. Crüger reports that in 1890 364 of these associations, with 33,166 members, had assets worth 17,184,362 marks, and liabilities amounting to 17,011,439 marks. The net profits were 172,590 marks, and the reserve fund about 822,000 marks. In 1891 the 735 banks belonging to the Neuwied association, with 70,000 members, did business to the extent of 30,000,000 marks. In 1892-93 the assets of 635 banks amounted to 27,182,348 marks, and their liabilities to 27,122,036 marks.

Cooperative banking has spread from Germany into other countries, especially into Italy. The report on Italy of the (English) Royal Commission on Labor tells us that the question of providing credit for the working classes was raised as early as 1858, in the Congress of Working Men's Associations held at Vercelli. The discussion was renewed at the next annual meeting held at Novi, and again at Milan in 1860, when certain proposals, put forward by Signor V. Boldrini, were carried.

Meanwhile, Signor Luzzatti, in a series of lectures delivered at Milan, in the course of 1863 and 1864, refuted the opinions advanced by Signor Boldrini, recommending instead the promotion of popular credit by means of co-operation and reciprocity, and advocating the establishment of people's banks similar to those founded in Germany on the Schulze-Delitsch system, and his advice prevailed.

The movement quickly spread through Lombardy, Tuscany, Emilia, Romagna, and Venetia, and finally penetrated into the southern provinces. In 1866 there were 8 people's banks in Italy, with a total capital of 1,940,000 lire; by 1871 the number had risen to 64, with a paid-up capital (*capitale versato*) of 23,968,984 lire, and a subscribed capital (*capitale sottoscritto*) of 26,640,440 lire; by 1881 it had reached 171, with a paid-up capital of 41,538,042 lire, and a subscribed capital of 43,449,670 lire. Notwithstanding financial crises, cooperative banks have continued to increase both in number and importance during the last 10 years, and it may be noted that in 1887, a year of acute crisis, 101 new banks were started, chiefly in the south. By the end of 1890 the total number of Italian cooperative credit societies was 738, with a paid-up capital of 92,000,000 lire, and a nominal capital (*capitale nominale*) of about 100,000,000 lire. This rapid progress is probably due partly to the action of cooperative congresses and the support of other cooperative societies, and of the Neapolitan and Sicilian banks, and other banks of issue.

In 1887 there was, on an average, one people's bank for every 46,809 inhabitants in the kingdom, and these banks were most numerous, relatively to the population, in Apulia and Basilicata, a fact which is the more striking when it is considered that the means of obtaining credit were formerly in a most primitive state in these southern districts, where the peasantry were completely in the power of the local usurers.

The people's banks have been to some extent transformed, or rather they have been supplemented by the institution of other popular credit societies, based generally on the same principle, and organized on similar lines, but differing in their character and in their aims from the original associations. Some of these societies are called "workmen's banks" (*banche Operaie, casse operaie*), "workmen's credit banks" (*banche di credito per gli Operaie*), "popular banks" (*casse popolari*), names which show the predominance of working men in the new associations. In one such bank at Modigliana, at the end of 1882, out of 350 shareholders (*soci*) 122 were working men, while the Cooperative Working Men's Bank of Cortado had a total of 337 shareholders, and numbered no less than 202 operatives and 63 agricultural day laborers.

A new form of credit cooperation has been introduced into Italy during the last few years by the institution of rural loan banks on the Raiffeisen system. These banks were first started in 1883 by Signor Leone Wollemborg, to protect the rural laborers and small landed proprietors of Venetia and Friuli against the exorbitant demands of money-lenders, by making it possible for them to borrow capital at a moderate rate of interest.

La Cooperazione Rurale, the organ of the Federation of Italian Rural Banks, mentions in the leaflet issued on January 15, 1893, that at the end of December, 1892, there were 50 rural banks in Italy which had received a total of about 103,697.08 lire in deposits, had granted about 554,761.76 lire in loans, and retained about 20,862.73 lire in reserve.

In other countries the development has not been so great. Austria in 1890 had 1489 credit out of a total of 1898 cooperative societies. Hungary had, in 1889, 576 cooperative credit societies. In Russia there were, in 1883, 1000 cooperative credit societies with 207,259 mem-

Other Countries.

bers, but the number of societies has since dwindled to some 800. Switzerland, in 1891, reported 20 cooperative banks with a capital of £88,987,032, and many other cooperative societies partly doing the work of banks. The Scandinavian countries have done little in this direction, and Holland has but few. In Belgium there has been more activity. In 1865 Leon d'Andrimont started the first Banque Populaire at Liège, and to-day there are some 15 such banks with a constituency of 11,000. Besides these, there are some Unions de Crédit. France has a few Banques Populaires, but they are little different from joint-stock societies. The function of cooperative banks, too, is partly fulfilled by the Syndicats Agricoles, and by Catholic societies founded by Father Ludovic de Besse. The government policy of aiding the savings-banks has, perhaps, prevented the extension of cooperative banking. In England, the home of cooperation of other kinds, cooperative credit has had little development, but is now making a beginning. In December, 1893, an agricultural banks association was formed to aid in establishing such banks, and its committee decided that the Raiffeisen system had been found the most uniformly successful. For the very great extension of cooperative credit in the United States, see BUILDING ASSOCIATIONS; for the principles involved, see COOPERATION.

References: H. W. Wolff's *People's Banks* (1893). See also COOPERATION.

COOPERATIVE COLONIES.—The principle of cooperation has been applied in recent times to the formation of innumerable colonies, or attempt at colonies. The more successful of these we consider under their respective names, but there are many more which we can only mention. They are cooperative colonies distinctly; communistic colonies we consider under the head of COMMUNISM. The exact principles governing the cooperative colonies are almost as numerous as the colonies, but they all turn more or less around the central idea of a number of colonists taking shares in the purchase of land, each share representing a certain amount of land, assessing themselves to meet improvements for the common good, and so developing the value of each share. Each shareholder here owns his own land, and there is no communal ownership as under communism. Colonies of this general description have been made by Swedes at New Sweden, Me.; by Swiss, near Chattanooga, Tenn.; by Russians, in Middlesex County, Va.; by Italians, in Bowie County, Tex.; by Germans, at Anaheim, Cal. There is a German Catholic colony at Marionfeld, Martin County, Tex.; a cooperative colony at Pasadena, Tex.; numerous colonies of Russian Jews in New Jersey (see COMMUNITIES), Illinois, Iowa, and Texas; a colony of Russian Menonites (*q.v.*) in Kansas, Scandinavians in Dakota and Minnesota. The establishment of New Rugby, in Tennessee, by Thomas Hughes, in 1880, led to quite a number of English colonies in Cranford, Woodbury, Plymouth, and Sioux counties in Iowa. *The Cincinnati* of May 16, 1895, gives the names of still other cooperative colonies: Fairhope Colony, Battles, Ala.; Gibbonsville Cooperative Colony, Grand Blanc, Mich.; Manistique Colony, Manistique, Mich.; Grander Age Colony, Handsborough, Miss.; Cooperative Colony, Greenwood, Ark. It must not, however, be supposed that all these colonies are established institutions. Many of them will probably be non-existent before this book reaches its readers, while new efforts will be taking their places, but such lists as these show how general and deep-seated is the ideal of a cooperative life. It must not be forgotten, too, that this does not include the communistic colonies, which are almost as many more, and which, as a rule, have been more successful (see AMANA; ECONOMY; ICARIA; KAWEAH; NEW HARMONY; ONEIDA; RUSKIN COLONY; SHAKERS; TOBOLOBAMPO; ZOAR, etc.); and these are colonies in the United States alone. For cooperative colonies and attempts more or less on this line in other countries, see COOPERATION; COOPERATIVE FARMING; GODIN; LECLAIRE; see also COMMUNITIES and COMMUNISM.

COOPERATIVE COMMONWEALTH, THE.—A designation often applied to the ideal socialistic state (see SOCIALISM). It indicates that socialism is not to be regarded as a despotism or paternalism governing the people, but rather as a fraternal brotherhood, where industry is to be conducted through the cooperation of all the members of the community. In its term *commonwealth*, it distinguishes socialism from mere cooperation, which may be the cooperation simply of a few individuals in a com-

munity. Socialism, or the cooperative commonwealth, is the cooperation of the whole community, and not of a few individuals only. The name "cooperative commonwealth" is also the title of a work descriptive of socialism by Laurence Gronlund (*q.v.*), the first and one of the ablest presentations of socialism which has appeared in the United States.

COOPERATIVE DAIRIES have had a very large success. Recent statistics put them at 1014 in Germany, 305 in Switzerland, 208 in Italy, while they are to be found in successful operation in England, France, Belgium, Austria, the United States, Australia, and elsewhere. (See COOPERATIVE FARMING.)

COOPERATIVE DISTRIBUTION.—For the history and statistics of cooperative distribution in different countries, see COOPERATION, Section III. For the contrast and opposition between cooperative distribution and cooperative production, see COOPERATIVE PRODUCTION.

COOPERATIVE FARMING. (See also COOPERATION.)—The application of cooperation to agriculture has been from the first the constant dream of all interested in cooperation in any way. It formed an important part of the plans of Robert Owen (*q.v.*), and has led to the formation of innumerable communities. These attempts, however, are best considered under the head of COMMUNITIES. In this article we notice the attempts at cooperative agriculture not by communities, but by cooperators free from community life.

ENGLAND.

The earliest English experiment of that kind, and one of the best known, is the one made by Mr. John Gurdon, at Assington, Suffolk, commencing in 1829.

In that year Mr. Gurdon let an off-hand farm to 20 laborers of his parish at the ordinary rates of farm rent, but agreeing to lend them capital without interest, provided they would each advance £2 as guarantee. A manager, accountant and stock-keeper were to be selected; any man convicted of fraud or crime was to forfeit his share; the capital was to be paid back as profits arose. The society was called the *Assington Agricultural Cooperative Society*. It was successful, and Mr. Gurdon, in 1854, lent another smaller farm in the same way to 34 more laborers. In 1864 Mr. Gurdon reported to the Social Science Congress that there were on the two farms 59 men who, out of their profits, had paid back all the capital he had advanced, and owned stock and crops on the farms valued at £50 a share. In 1892 the larger association was still existent, with 21 members, and each share worth £40, but only one member of the society worked on the farm. In 1883 the younger society was broken up by a long series of disastrous years, tho each shareholder received £16 10s. for every £3 paid in. However, a new association was formed, and struggled on. It took increased land, but had to pay a heavy rent, and in 1892 voted that unless the landlord would reduce his rent 25 per cent. it must disband.

Early Experiments.

In 1837 Mr. T. G. Craig, a disciple of Robert Owen, was invited by an Irish landlord, Mr. J. S. Vandaleur, to form a cooperative society at Rathlakin (or Ralakin). A society was formed with 28 men, 12 women and 52 children. It was successful for two years, when it was suddenly broken up by the flight of Mr. Vandaleur, who had ruined himself by gambling.

About the same time Lord Wallascourt commenced another Irish experiment, and reported it in 1846 a success. After these early efforts, we find record of no experiments of this kind in England till Mr. William

Lawson's attempt at Blennerhasset, Cumberland, commencing in 1861. Mr. Lawson became an enthusiast on cooperation, and devoted a farm of 420 acres to it. He found his people, however, apathetic. At first only one voted for his plan. Two years later only eight would vote at all, and three voted against it. They were afraid of his experiments, and doubted his ability. However, a start was made. There was a weekly "Open Council;" there were free reading-rooms, library and schools, baths, concerts, festivals, etc. Mr. Lawson introduced a steam plow. To help make profits, Mr. Lawson mortgaged his farm and invested in American securities. In 1872, however, the farm did not pay, and was sold at a total loss of £18,622. The failure, however, was laid to Mr. Lawson's methods, not to cooperation.

February 1, 1873, Mr. Waller Morrison made a cooperative attempt in the parish of Brampton Bryan. The shares were £5, and no one could become a member without Mr. Morrison's approval. He rented the society a farm of 143 acres at £140, and later £130. The experiment endured till 1879, when a small deficiency was reported.

The North Seaton Cooperative Farming Society, founded in 1873, has been more successful. It began in a small way by some colliers cooperating to establish a cooperative dairy, and has made a small dividend each year. In 1891 it had a capital of £330 and 104 members.

In 1883 Mr. Bolton King commenced an experiment at Radbourne Manor Farm, under very generous rules, but it was not successful.

Such are some of the earlier typical experiments in England. Lately much general attention has been given to the subject, and there has been much successful result. In connection with the failure of many efforts, it must not be forgotten how depressed has been the condition of all British agriculture. Indeed, it has been this very depressed condition that has been the main cause of so much attention being given to cooperative attempts in the hope of their meeting the need. Said Mr. G. Thorpe at a conference at Manchester, December 16, 1893, in regard to agricultural cooperation:

British Agriculture. "The grave condition of British agriculture is exciting no small amount of interest in nearly every class and condition of society. One can scarcely take up a daily paper without finding some reference to it. Quite recently it had been debated in the House of Commons by leading agriculturists, who take as a rule a gloomy view of the situation, and especially if they be large landholders as well. No great reform meeting is held in any part of the country without the land question or agriculture being discussed; indeed, the Government have already appointed a royal commission to make the fullest inquiry into the causes which have led to its present depressed state. It has forced the formation of an Agricultural Union composed of laborers, farmers, and landowners. The union has held two great national meetings in London for the express purpose of calling the nation's attention to agricultural grievances, and to enlist its support and sympathy for their removal by legislative enactments. . . . The average price of wool from 1871 to 1881 was 31s. 3d. per stone, and for the 10 years ending 1891, 11s. 3d. In other words, there is a loss of £19 13s. on every 100 sheep, and since there are over 33,000,000 of them in the United Kingdom, it follows that from this source alone the loss to the farming population annually must

be very great. . . . In 1872 the average price of wheat was 57s. per quarter; for the 10 years ending 1881, 50s.; for the 10 years ending 1891, 34s. 11d., and for the last month in December, 1893, 25s. 7d. It has been estimated that through a fall in prices the loss on wheat, barley, and oats, during the last 15 years, to the agricultural interest is equal to £193,000,000. . . . The decrease in acres of wheat last year (1893), compared with 1892, is 322,350, or 14.5 per cent., and with the previous year 409,798, or 17.8 per cent.; and since there are not more than 2,000,000 acres at present devoted to wheat in the United Kingdom, it follows that if the same ratio of reduction goes on, we as a nation will cease to grow wheat in less than five years from now. The average yield per acre for 1893 is put down at 26 bushels, which means 6,500,000 quarters, and since our annual consumption amounts to about 28,958,000, we shall be dependent upon the foreigner for nearly 22½ million quarters during the year 1894. The number of cattle has decreased also during the same period by 244,107, and sheep by 1,454,370. Therefore, we have this serious fact, contemplate it as we will, that while the daily addition to our population is between 700 and 800, our home-food products have decreased during the past year from 3.5 per cent. to 14.5 per cent., with every tendency to a still further decrease in the items here named in 1894. . . . I have given you these facts and figures to prove (if proof is required), first the depressed state of our farming industry, and in the second place to show that there is a market at our very door for all the produce we as cooperators can obtain from the land. Mr. George Gale, in a letter to the *Leeds Mercury*, December 22, 1892, stated that 'during the last 10 years nearly 300,000 small holdings have been destroyed, in many cases in order to satisfy the greed of men who desire to hold more land than they can effectively use.' He further stated that there is not a county in England to-day in which small farms are not at a premium at double the rent, or nearly so, compared with the 6000 large farms which are unlet, ranging from 5s. to £1 per acre. Indeed, our allotment system has given such overwhelming evidence in favor of small farms that we may safely anticipate in the near future a gradual breaking up of large farms into lesser, for the simple reason that lesser ones require in proportion a larger number of men to look after them than large ones in proportion to their yield. That something is being done to reduce the size of large farms is shown by the returns in regard to the progress of allotments. In 1885 the number of allotments in England was 348,872, but in 1890 they had increased to 441,024, or 26 per cent."

The result of such a depressed condition of affairs has been to make the English cooperators at once very anxious to apply cooperation to agriculture, and very cautious in the attempt. At the Congress held in Edinburgh in 1883, the president, the Rt. Hon. W. E. Baxter, M.P., laid especial stress upon the subject, and as the result a Scottish Farming Association was founded. It has met with a marked success, altho with great difficulties. More recently several successful English distributive societies have taken up a farm to operate cooperatively in connection with their stores, and not a few successful farms, dairies, and creameries have thus been commenced.

According to the report of the Central Cooperative Board for 1894, the following are the statistics of cooperative farming in Great Britain:

Recent Attempts.

SECTION.	Societies.	Acreage.	Capital.	Rent.	Profit.	Loss.
Midland	6	180½	£3,695	£346	£277	...
Northern	14	1,451½	25,563	1,622	518	£342
Northwestern	14	636¼	17,897	1,117	266	110
Scottish	3	800	11,175	1,640	206	1,167
Southern	5	392	16,613	340	403	288
Western	2	190	1,300	400	...	185
Total.....	44	3,650	£76,243	£5,525	£1,670	£2,092

The report for 1891 gives details of several farms at that time :

NAME OF SOCIETY.	County.	Acreage.	Capital.	Rent.	Profit in 1890.	Loss in 1890.
Derby	Derby	26	£78
Lincoln	Lincoln	11½	£700	..	£34	..
Lye	Worcester	14	38	6	..
Ripley	Derby	50	1,000	100	..	£5
Aspatria	Cumberland	64	850	154	..	71
Bedlington	Northumberland	74	927	116	92	..
Cleator Moor	Cumberland	52½	250	150
Consett	Durham	100	981	129	35	..
Middlesborough	Yorkshire	28	75	95	..	39
Newbottle	Durham	50	180	116	45	..
Newcastle-on-Tyne	Northumberland	122	7,331
West Stanley	Durham	188	2,200	88	33	..
Willington	"	10	15	27
Bingley	Yorkshire	25	90
Halifax	"	48	318	175	21	..
Lancaster	Lancashire	100	1,500	190
Manchester and Salford	"	370	4,000	600	..	646
Mirfield	Yorkshire	15	80	45
Pendleton	Lancashire	36	250	73	..	18
Plymouth	Devon	103	1,200	280	..	25
North Seaton	Northumberland	30	302	..	48	..
Scottish Farming	Renfrew	282	3,362	..	480	..
Assington	Suffolk	223	3,127	211	..	351

The three last on the list are farms worked by separate farming societies; all the others are farms attached to stores.

The above tables do not include attempts at profit-sharing (*g.v.*) in agriculture.

OTHER EUROPEAN COUNTRIES.

Cooperative agriculture in France has developed mainly along the lines of cooperative dairies, and of so-called *syndicats agricoles*, for cooperative societies for purchasing at favorable rates.

France.

"Of the success of these syndicates," says Mr. H. W. Wolf in the *Economic Journal*, "there can be no doubt. Begun most modestly scarcely 10 years ago by a handful of agriculturists brought into union by Professor Tanviray, of Blois, they have in little time overspread France, multiplying in all to the number of 1300, with about 600,000 members, and doing an annual business at present of 100,000,000 francs, which promises to grow rapidly to higher figures. They are to be met with in almost every part of France.

"The syndicates help the vine-grower and the sugar-beet grower, the horse-breeder and the market-gardener; they lend a hand in the destruction of obnoxious insects, the embankment of watercourses, fumigation for keeping off the frost; they have even provided French agriculture with boards of conciliation and arbitration, and insurance of laborers against accidents; and, above all things, they have, in M. Gatalier's apt words, wholly 'democratized' the use of artificial manures, insecticides, feeding stuffs, etc., placing what was formerly a luxury reserved for the rich within the easy reach of the poor, improving the quality, reducing the market price by from 20 to 30 per cent., and yet increasing the annual consumption from the paltry figure of 52,000,000 francs—barely more than 2,000,000 for all France—to 120,000,000 francs."

The constitution of these associations, which were avowedly promoted in order to "suppress socialism," varies considerably: "Most of the *syndicats* have two classes of members—the rich, who take up heavy shares, must not borrow, and are bound to remain members for a definite time—five years or so; these are the *membres fondateurs*; and the poor, who take up smaller shares, are free to leave, and who may borrow, these are the *membres effectifs*."

Agricultural cooperative societies in Belgium date from 1885, when the first was established at Landen. Others exist at Perck, Tinglemont, Ghent, Marche, Genappe, Hasselt, Liège, Tongres, Namur, Grivegnée, Virginal, Jodoigne-Perwez, Cerexhe-Mélin, and Brée, the last of these was instituted in 1890.

Belgium.

All these societies were founded by large landowners and farmers. With the exception of the two last mentioned, their object is to purchase and retail to members, fodder, corn, and other articles. The cooperative dairy at Cerexhe-Mélin, established in 1889, is the earliest instance of an agricultural productive society in Bel-

gium. At the end of the same year another cooperative dairy was instituted at Peuthy, with a minimum capital of 2000 francs, divided into 80 shares of 25 francs. Twenty shares have been purchased by purveyors of milk, the remainder by other persons admitted to membership. Each member is paid according to the quality of the milk supplied by him, after a slight deduction has been made for the expenses of the dairy. The dairy at Brée, established in 1890, has now (1893) 11 members, all farmers, and works satisfactorily.

Cooperative agriculture in Germany has had a very large development, perhaps because Germany is the classic home of the cooperative land banks. (See CO-OPERATIVE BANKS.) In 1883 a German agricultural cooperative union was formed, which in 1889 included credit societies or land banks, associations for buying raw material, dairies, and other societies. In May, 1892, there were 1020 agricultural societies for buying raw material, 299 for buying tools, etc., 1014 dairies, and some 80 stores, and societies for cattle rearing, forestry, etc. (See COOPERATION; CO-OPERATIVE PRODUCTION, etc.)

Germany.

Switzerland has 305 cooperative dairies and various cooperative land bank societies for insuring cattle, etc.

In Italy cooperative dairies occupy a prominent position. In some districts the cooperative dairies have existed from time immemorial, in others they are of more recent origin. They have different names, and are not all organized after the same pattern. The simplest and most primitive form is that of "milk-lending" (*prestito del latte*). A number of cattle-breeders agree to lend each other their milk day by day in turns. The member whose turn it is to receive the milk makes it into cheese and butter in his own cottage, for his own profit. In some places each man possesses all the necessary utensils for cheese-making, in others they are common property, and are carried from house to house. This custom, which in many districts has been observed for centuries, still exists, according to Professor Ugo Rabbeno, in certain Alpine valleys and in southern Italy. The report of the Director General of Statistics for 1890, however, states that the usage of "milk-lending" does not appear to be practised anywhere at the present day.

Italy.

"Milk-lending" has been almost if not entirely superseded by the "alternating system" (*sistema turnario*), which is also very ancient. All the producers of milk in a village unite to employ a cheese-maker to look after a cottage and a set of cheese-making utensils, which they hold in common, and to help in working up the common supply of milk. Each small cultivator, when he has produced as much milk as can be worked up in a day, has a right to the whole produce of one day's cheese and butter-making. On the day appointed him he goes up to the cottage, laden with fire-wood, rennet, and salt, superintends and helps in the cheese and butter-making, and pays all expenses incurred. The butter he at once sells, or carries away with him. The cheese is marked with

his name, and is kept for salting in the common stock until the time for selling it arrives. This system of cooperative dairy farming is found in the Alpine districts in Piedmont, Friuli, Carniola, Emilia, and parts of Lombardy.

The dairies in 1891 were 208. A beginning has also been made at cooperative bakeries and farming itself, for the benefit of the peasants, but as yet with little result. (See COOPERATION, section "Italy.")

THE UNITED STATES.

The following account is taken from the Report on the United States of the English Royal Commission on Labor (1893). There exist to-day no accurate statistics. Several of the stores mentioned in this account have since failed, but newer ones have been started. There is much talk to-day and many attempts—mainly weak ones—at cooperative agricultural communities. (See COMMUNITIES.) The account in the report is, in part, as follows:

"In the 10 years which succeeded the war, farmers suffered greatly from the low prices at which they were obliged to sell their produce and the ruinously high prices demanded by the retail traders for agricultural implements and machinery and for the necessities of life. To remedy this evil the Grangers inaugurated a cooperative system whereby farmers might combine to obtain goods in large quantities direct from the manufacturers, or to contract with local merchants to supply them at reasonable prices. The so-called Grange stores arose in this way. The purchasing and distributing agencies found it convenient to have central warehouses and stores in which to conduct their growing business. Want of business knowledge and incompetent agents led to the collapse of many of these stores; but a considerable number were successful, and still continue to flourish. Many successful branches exist in Maine, New Hampshire, Connecticut, and the more agricultural parts of New England, though here the need for them is, perhaps, less

The Grangers.

keenly felt than farther West. The Patrons' Cooperative Corporation of Portland, Me., has a capital of \$40,000, and does an annual trade of \$175,000. Most of these stores sell goods at low prices to members of the Grange, and divide the profits between the shareholders.

"In the Northwestern States the Grange movement has had considerable influence, and there are a number of stores. The most successful is the Farmers' Exchange at Grinnell, Ia., founded in 1874. The membership is not now restricted to patrons of husbandry, and the profits are divided among the shareholders; indeed, no Grange store appears to have actually adopted the Rochdale principle of dividends to purchasers, though any purchaser of \$20 worth of goods has recently been allowed an extra dollar's worth at the Farmers' Exchange. The history of the Farmers' Protective Association of Des Moines, Ia., is of some interest. In 1880 the Washburn & Moen Manufacturing Company of Worcester, Mass., had obtained a monopoly of the manufacture of barbed wire fencing, by buying up a number of the patents and then claiming the proprietorship of the principle of a barbed wire fence. Their claim was sustained by the decision of a Federal court sitting in Illinois, and they then formed a combination whereby 40 establishments were licensed to make and sell a limited amount of barbed fencing at a fixed price, paying a royalty on each pound to the Washburn Moen Company. Retail prices were increased 40 per cent., and the farmers in revolt determined to employ an agent to secure the wire for them at a lower rate. The first agent was won over by the company, but a second was appointed who obtained the necessary supply from an unlicensed factory at Grinnell. In 1883 the case was tried, and the claim of the company was disallowed. In 1885 a monopoly in a special and favorite kind of wire was again sanctioned, and the Grinnell factory found itself obliged to close, whereupon the farmers established a factory of their own at Des Moines, which regulates prices, tho its own product is comparatively small. In Ohio, Indiana, Michigan, Kansas, and the West and South generally, Grange stores are to be found, tho in Ohio they have been comparatively unsuccessful."

ADVISABILITY OF COOPERATIVE FARMING.

Concerning the general advisability of cooperative agriculture, the following extracts from a paper read by Mr. W. G. Loveday, of Rugby, at the Cooperative Congress of 1887 in England, tho primarily applicable

to that country, is of general application. He says (in part):

"Notwithstanding the present deplorable state of agriculture, and the wretched condition of a large portion of the land, I believe that, without returning to the policy of taxing bread, agriculture can be restored to its former prosperity and trade participate in its blessings, by cooperators and cooperation putting back the land into the hands of the people. But for agriculture, even in the hands of cooperators, to become permanently successful, it is absolutely necessary for us to purchase the land that we intend to cultivate. This will require the efforts and capital of cooperative societies for years to come. It may be the slowest means of getting cooperators upon the land, but I am convinced it is the safest, and that the end will abundantly justify the means. Far be it from me to say that no society ought to engage in farming land that may be taken on reasonable terms and under favorable conditions; but I do consider it to be *absolutely necessary*, in order that cooperators may farm with safety and profit, that they should own the land they cultivate. The following reasons have guided me in coming to this conclusion: 1. The miserable condition of the land. 2. The unfavorable restrictions under which the tenant farmers often labor. The foul, poor, neglected state of the land speaks for itself. An enormous amount of labor must be put into it before it will yield crops sufficient to pay the cultivator. Draining, ditching, fencing, cleaning and manuring are immediately necessary; in other words, much money must be sunk in a farm, such as cooperators would be likely to secure, before there could be a fair return of profits. There would be no difficulty with many societies in finding money to meet these requirements, nor would there be lack of spirit to invest it, but there is the almost absolute certainty that it would never return to them again. As yearly tenants they would be entirely at the mercy of the landlord, who could either raise the rent and make them pay for the improvements, and so prevent them from receiving their money in profits; or he could turn them out and let the improved farm to another tenant at a higher rent, and so put their outlay into his own pocket. . . .

"The kind of land to be purchased for cooperative enterprise is worthy of serious consideration. Cheapness should not be the main or only object in view. Cheap land, like other cheap things, is not always the most profitable. Heavy clay land should be avoided at any price, at least for the present. A mistake at starting might retard the progress of cooperative agriculture. A farm that can be worked under reasonable conditions, in moderate weather, should not be refused because it is foul. Labor and capital, if judiciously applied, will improve it and make it yield a profitable return. But I would warn societies against *taking* land of this description to farm, as yearly tenants or upon short leases. Indeed, there are baits on land as well as in the water, and those who swallow them may find a hook in them. It is impossible for me to mention the exact size a farm should measure, for the simple reason that no standard size would be suitable in every case. The society's purse should in each case be the rule by which the farm should be measured. In other words, take no more land than you have money to stock and work properly, whether your farm measure 20 or 200 acres. A farmer without capital is a worker with both hands tied behind his back.

"Societies that engage in farming must choose for themselves the best system of cultivating their land. No uniform system can be profitably adopted in all places and under all conditions. If the farm produce can be consumed at home, the expense of carriage will be dispensed with, and the profits increased by doing without the middleman. The nature and quality of the soil must be taken into consideration, or the best efforts may end in failure. But a few general remarks on the size of farms and on the profitable working of them may not be out of place here, and may be useful to societies about to engage in farming whose members have had no practical experience in these matters. In many respects a farm of moderate size should be preferred. It gives ampler scope for the employment of agricultural implements, so useful to farmers in cleaning the land and helping on the heavy farm work. Besides, the small farmer has often cast upon him the unpleasant and sometimes unsuccessful work of borrowing of his neighbor those things which are so needful for his use, but too expensive for him to purchase. Better opportunities too are given for growing a variety of crops to feed the stock with during the winter on a moderate than on a small farm. . . .

Practical Advice.

"Dairy farming is becoming the rule, but it has brought little relief to the farmers as a class. In my opinion, for dairy farming and feeding to become profitable, the plow must again become partner with the milk-pail. There has been a divorce, but the separation has brought neither pleasure nor profit. Roots and corn are necessary to successful dairy farming. The mixed farm gives the farmer considerable advantages in his business. He can make the whole of his land contribute to his success, and the arable portion of it will prove as profitable as—perhaps more so than the pasture. A heavy root crop, tho costing a large amount for labor, will be found invaluable in the winter for dairy and feeding purposes. The farm should supply *straw* for litter and for chaff, to return to the land in manure; *green clover*, which cannot be surpassed for feeding purposes and for milk, and when dried will furnish the horses with food for the winter; *corn* to feed mutton, beef, pork, and poultry, and the remainder can be taken to market; *roots* for sheep and cattle, which will probably make the best return of all. The root crop, besides furnishing the best farmer with his best food supply for his cattle in winter, gives him the best opportunity for cleaning his land, and leaves it in better condition for the next crop. Should the hay crop prove a failure, the loss would not be felt so severely if the farmer had corn, straw, and clover to fall back upon. I have made no attempt to give lists of figures showing that so much land can be secured for a certain rent, that there must be so much outlay for labor, manure, and other expenses, and that the receipts for corn, meat, milk, and eggs amount to so much, leaving a balance in favor of or against the tenant. Farming by figures on paper may be pleasant, but it is not very practical; but farming on land is practical work. And what we as cooperators want to know is, how it can be made profitable. The results given by those who are engaged in agriculture may be of great interest and some service to us, as also may a knowledge of their methods of cultivation, but these will only be of partial use; for the same outlay in the same manner on another farm will produce different results. Neither has any scientific nor new-fangled system of farming been referred to, because there is no 'royal road' to fortune in farming, by which every one who walks upon it is brought to certain success. In farming one ounce of practical knowledge is worth one ton of theory. And this knowledge must be gained to a very great extent by observation and practical experience. The secret of success in any system of farming is the art of burying in the land carefully, constantly, and securely, a large amount of time, talent, labor, and manure, and of waiting patiently to see it rise again, under the blessing of Providence, in a continual harvest, to reward the worker for his toil. Poultry and fruit-growing should have particular attention on cooperative farms." (For references, see COOPERATION.)

COOPERATIVE PRODUCTION.—The student of cooperation (*q.v.*) will find in that movement two ideals at work, not only separate and distinct, but to an extent contradictory and mutually opposing. These two ideals are cooperative production, or workers cooperating to produce goods for the benefit of themselves as producers, and cooperative distribution (*q.v.*), or persons cooperating to purchase together for their benefit as consumers. It is true that it is quite possible to exaggerate the opposition between these two ideals. All producers are consumers and most consumers are producers, and this should never be forgotten. Nevertheless it does, in carrying the cooperative idea, make deep difference even now whether you consider first and foremost the interest of the producer or the consumer, and, above all, it leads to still greater differences. Cooperative production is by no means impossible under a general system of individualism. Cooperative distribution is much more apt to lead straight to socialism. Why this is so we shall see in a moment. Under cooperative production a little or a large body of workers agree to work together, not under an employer, but cooperatively, altho

usually choosing one or more of their number to manage the business. They then sell the product of their united labor and divide the profit equally, or according to the amount or value of work done by each according to some equitable Cooperative Production vs. Distribution system previously agreed. The unit of cooperative production is thus the body of workmen who produce together. It is true that various bodies of cooperating workmen may federate, and so develop one large cooperative productive body, and possibly eventually a complete cooperative civilization, resting on the cooperation of workers, but this is really individualism and not socialism, since it rests on the cooperating of individual workmen who choose to come together. Under cooperative distribution, on the other hand, it is not the producees who come together, but it is people who agree to cooperate in making purchases, and so getting cheaper prices, partly by buying by the wholesale, partly by doing away with the middleman. Now this in itself is not socialism, but it does lead toward it, for the reason that it tends to unite all classes of the community, and appeals to the poorer workers even more than to the better paid, and so lends itself to the communal and collective organization of society much more quickly than cooperative production. Cooperative production is so much more difficult to start than cooperative distribution or cooperative stores, that it is usually only the higher class of laborers who can cooperate in production, or if the less educated do attempt it and succeed, it is not seldom under the guidance of some individual or society of the more educated. Cooperative production thus almost insensibly tends to develop little groups of skilled workmen whose interest is to sell as highly as possible for their own good. Its ideal is the self-help, the self-development, the independence of the producer. Cooperative distribution, on the other hand, can be commenced by almost any one. Even the poorest can agree to club their purchases together and so start a cooperative store. Anybody, too, can purchase there. It thus tends not to develop little groups of competitive producers cooperating for their own good, but larger groups interested in buying cheap, and so saving middlemen, etc., and thus, as some claim, leading to a cooperative commonwealth resting not on the producers as producers, but on the whole community. Recognizing all the community, it strives to give each a chance to live, and so does not in the long run tend to lower wages in order to get commodities cheap, tho it must be admitted that at first, in the endeavor to buy cheap, cooperative stores have been tempted to scrimp wages in order to lessen cost. This tendency has, however, not endured, and as a matter of fact distributive cooperation has not in the long run lessened wages. (See COOPERATION, Section V.)

We do not need here to dwell upon the history or statistics of cooperative production. They will be found under cooperation. It should be said, however, that cooperative production was the earlier ideal in the cooperative movement. It was the ideal of the first Eng-

lish Christian Socialists (*q.v.*)—Maurice, Kingsley, Ludlow, E. V. Neale, Hughes. It is still the ideal of the survivors of this little group, and generally of the older

History. English cooperators. Messrs. E. V. Neale and Hughes have at times severely criticised the present Eng-

lish cooperative movement, because the majority (tho not all) of English cooperators have gone over to the distributive ideal. On the Continent, too, cooperative production was the first ideal, and still has a larger following than in England. (See below in this article.) In the United States also cooperative production had, on the whole, the first support. Witness the various attempts which have now for the most part passed away of cooperative productive communities, cooperative workshops, cooperative mines.

On the other hand, the advocates of distributive cooperation claim that actual experience shows that this is at once the easiest, the most practical, and ultimately the most beneficent kind of cooperation. It is unquestionably the kind that has thrived best in all countries, tho some claim (see below) that this is now changing. In England the contest between the two schools of cooperators has elicited no small attention. The great English cooperative wholesale society has come to stand in the main for the distributive idea, the Scottish wholesale for the productive idea. Of the present situation in Great Britain, John Graham Brooks says, writing in the *Political Science Quarterly* (vol. x., p. 538):

"Over this relation of the worker to the profits, a long and somewhat bitter fight has been waged. Year after year resolutions have been passed, such as that in Bristol, 1893, urging 'the principle of copartnership of labor as an essential of industrial cooperation.' A few great leaders of the Christian-Socialist movement still attend the congresses to shape and urge such resolutions. These seem, however, only a respectful concession to the framers. The resolution is not kept nor is it meant to be kept by the great body of those who control the real business of cooperation. It is true that the Scottish Wholesale pays a bonus to labor (the English society abolished bonus in 1876) and comes distinctly closer to the hope of those who wish to make capitalists of the laborers. Yet it is all plain in this history that, so far as actual achievement is concerned, the form of ideal cherished by the Christian Socialists is losing its hold.

"So far as this is denied, appeal must be made to the superiority and more hopeful condition of the Scottish Wholesale, which still keeps the welfare of the producer (as against the consumer) clearly in view. Bonus is now given to labor, as profits are given to the consumer. The Investment Society exists to bring the workers into the Wholesale as shareholders, and care is taken to make the investments of the Wholesale also cooperative investments. In a word, the ideal of the Scottish society regards the worker as producer, making it possible for the laborer to become a shareholder and 'capitalist.' It wishes profits to go to him as a worker. Before the royal commission, Mr. Maxwell stated this as his 'highest ideal.'

"Both the leaders of the English societies, Mr. Mitchell and Mr. Jones, place their emphasis not on the producer, but upon the consumer. This difference is not without importance. The old idea would (as profit-sharing does) help the *élite* workers. The newer and more socialistic idea is to raise the standard of living among the mass. The older writers, like Ludlow, laid stress upon the greater moral significance of production. Consumption was regarded as selfish, while production was unselfish; 'the divine element in man is the productive one, the consuming element is the terrene,' etc. It must be confessed that this moral distinction is not a helpful

one. The more socialistic view lends itself quite as fitly to ethical fervors as the other—is indeed made the ground of a higher moral appeal. The very aim of this more democratic cooperation is 'to eliminate all other motives in business except those that can be honestly recompensed.' 'Where production and consumption so work that profit on price is abolished, social utilities may exchange in such manner that none may rob another.'

The main argument, however, against cooperative production is made from experience. Beatrice Potter (now Mrs. Sidney Webb), in her *The Cooperative Movement in Great Britain*, shows that 95 per cent. of cooperation in England is distributive. She says:

"Of some hundreds of associations of producers known to have existed before 1870 only three remain. And passing over the dead bodies of some hundred societies registered from 1870 to the present day, let us rapidly survey the actual existing societies which have been, or claim to have been, organized in the interests of the producer. I take as a basis of our investigations the list of cooperative productive societies published in the Report of the Central Board for 1890. First we must eliminate from this list the productive departments of the wholesale societies, and the corn-mills and baking societies avowedly organized in the interests not of the producer, but of the consumer. Secondly, we must cast out as unworthy societies such as Mitchell Hey, registered under the Industrial and Provident Societies Act, but which have practically become joint-stock associations, participating neither profit nor government with the workers. Thus, from a list of 106 separate societies, with a turnover of £2,308,028, we are reduced to 74 manufacturing and 5 agricultural associations, with an aggregate turnover of £455,477. Of the 74 manufacturing societies 20 are not in working order."

Productive Associations not Successful.

The completest study of cooperative production, however, is Mr. Benjamin Jones's *Cooperative Production* (two vols., Oxford, 1894). Mr. Jones is, however, London manager of the Cooperative Wholesale Society, and a disbeliever in cooperative production, and it is claimed, therefore, that his conclusions and even his statistics, which are very strongly against cooperative production, are unfair.

As a statement favorable to cooperative production, we quote from an article on cooperative production by Henry W. Wolff, in the *Economic Review* (January, 1895). It says:

"In Italy cooperative societies of working bricklayers, stonemasons, and even ordinary navvies have become a recognized institution. Germany already possesses some very successful productive cooperative societies. In France, the *Associations Ouvrières* are moving onward on a triumphal progress. In England, the small band of productive associations, applying the cooperative principle as yet only in the more or less elementary form of copartnership of labor, constitute at present actually the

Argument for Cooperative Production.

only section of the cooperative host which has any victories to show. Cooperative supply appears to have met with something like a check, and almost to be coming to a standstill. The roll of societies newly forming does not equal the number of those dropping out of existence. As against 1471 societies existing in 1892, there were in 1893 only 1465; and, tho members have increased from 1,142,962 to 1,202,738, sales have not kept pace with such advance, and profits have dwindled. The last balance-sheet published by the Wholesale Society actually shows a decline of sales to have taken place, amounting to £105,793 on the three months. At the same time there has been abundant wreckage. The total of 1313 supply associations existing in 1891 survived, so to speak, by the graveside of no less than 844 societies registered between 1870 and 1880, but passed away since. Copartnership societies, on the other hand, have slowly multiplied, and at the time of writing number 108, with every promise of further increase."

Argument against Cooperative Production.

Mr. Wolff then goes on to vehemently criticise Mr. Jones's book, and says :

"It is quite true that the organization of cooperative production constitutes a most difficult problem, and that we have in the past fallen into many serious mistakes. What great movement has fared otherwise? *Errando discimus*. Swift tells of a general who was asked in his old age why he won so many battles. 'Because I lost so many when I was young,' so went the reply. Even without his remarkably ingenious handling of facts, which, to apply Mr. Chamberlain's figure, converts a harmless picture gallery into a 'Chamber of Horrors,' Mr. Jones could not have found it difficult to string together, out of past experience, a tolerably formidable catalogue of failures. Dr. Häntschke, in his book, written in a very different spirit, does exactly the same. But he rightly observes that, as an argument bearing on the question, one single success proves very much more than any number of failures. Even among Mr. Jones's long calendar of charges it is not difficult to pick out many a case calculated to inspire encouragement. Men have begun well, have striven well, have almost or partially succeeded. But fashion has changed; ill luck has had its sway; things have gone against them. Such reverses are not unknown among non-cooperative enterprises. There have been other forces at work to mar results. The jealousy of the Wholesale Society stands for not a little in past cooperative failures. The want of judgment shown in the relief work done by the Aid Association is accountable for some more. It is an utter mistake to seek to prop up productive concerns by little doses of £25 or £50, coming from outside. Such support has, indeed, often proved fatal, because the Aid Association, however willing to lend when things went well, showed itself extremely careful to call in its loans the moment that the horizon became clouded. The proper aid association for a cooperative workshop is a cooperative bank, which gives support, as a matter not of charity, but of business, and therefore compels borrowers to calculate well their chances of success before they borrow. Apart from all this, our productive associations have, like many others, in not a few instances started on obviously wrong lines. They have chosen unfavorable ground, or else selected precarious trades. . . .

"What the cooperative workshops therefore mainly want is sound instruction of the employees in business ways, in bookkeeping and shop-management, and in strict adherence to cooperative principles. How very apt even the best of our cooperators have been, in the past, to sin against this sound canon of cooperation appears very strikingly from a

Successes.

comparison which Dr. Häntschke draws between the very successful weaving-mill of Lübbecke in Westphalia, founded on the philanthropic model by the Rev. P. Bloink, and the Atlas Iron Works, of Southwark, founded in 1851 by the late Mr. Vansittart Neale. Both establishments were based practically on the same principle. They were philanthropically cooperative workshops. Looking at the general want of success of our own cooperative weaving-works pointed out by Mr. Jones, the presumption seemed to be against the German establishment. Nevertheless, it has achieved very signal success, while Mr. Neale's works have failed *simply* because Mr. Neale, after laying down his money, left the men to themselves, whereas Pfarrer Bloink took them personally in hand, and trained them step by step to business management, until he could trust them to carry on the concern by themselves. Similarly, it is to their good fortune in securing a capable bookkeeper and a very able manager, that the Milan cabinet-makers owe their success. And it is the business capacity of men like M. Buisson which has led the French *Associations Ouvrières* to triumph. It really seems to matter less on what basis a cooperative workshop is in the first instance started, whether as a purely working men's establishment, or as a philanthropic or partial partnership venture, so long as its management is kept on strictly cooperative lines. Sound instruction in business ways and in cooperative practice appears to be really the chief essential to success. And it is on this ground that our labor associations has been already found so extremely serviceable. It shows co-operators how they ought to set to work. It provides them with teachers and leaders for as long as is necessary. It has no funds to give; but it gives what is better. It is for this reason that it has shown itself so fruitful of satisfactory results. . . .

"Associations of the kind described, unions of what Mr. Ludlow has called 'associated self-employees,'

are, however, manifestly practicable only in small establishments, or else in enterprises in which the main element contributed to production is labor. It is so in the Milan Cabinet-makers' Society, a body of about 500 members scattered over 26 villages. It is so to an even greater degree in the Italian *Società dei muratori*, and *Società dei braccianti*—societies of working stonemasons and bricklayers, or else of mere ordinary navvies, who, as the official *Relazione* referred to shows, have carried out very considerable contracts—more particularly since the passing of the Baccarini law has empowered public bodies, giving out such contracts, to dispense in their case with the ordinary condition of caution money. Here we have the great problem, which was long considered hopeless, solved—cooperative production applied to unskilled labor. And wherever the *società* have been well officered, they are allowed to have done their work well. I have this from men in authority who are opposed to the system. The *Relazione* puts the total value of contracts executed by the *società* from May, 1888, to December 31, 1891, at 5,300,000 lire (£212,000). Since then these societies have carried out larger contracts still, and have done all their work well wherever ably led."

Such are the *pros* and *cons* of cooperative production and distribution. (For the general history of such cooperation, for its statistics and the surprising development of cooperation as a whole, see COOPERATION.)

COOPERATIVE STORES. See COOPERATIVE DISTRIBUTION.

COOPERATIVE WORKSHOPS. See COOPERATIVE PRODUCTION.

COPYRIGHT is the exclusive right to publish intellectual productions, such as books, papers, plays, paintings, sculptures, designs, music, photographs, etc.

The first copyright law of England dates from 1710, tho somewhat previous to that exclusive rights of publication had been granted for limited periods. The law of 1710 granted copyrights to authors for 21 years for books then in print; for books to be printed it granted copyright to publishers for 14 years, and then to the authors, if living, for another 14 years. After various changes, by the law of 1842, copyright could be given for 42 years, or to seven years after the author's death. Foreigners could acquire copyright by publishing in England.

In Germany, copyright laws date from 1837, and by the law of 1845 could be extended to 30 years after the author's death.

In France, copyright exists for the life of the author or his widow, for 20 years for his children, and for 10 years for other heirs. The Belgian law is the same, except that all heirs can hold copyright for 20 years after the author's death.

Copyright in the United States, by laws dating from 1790, were granted only to citizens or residents. Art. 1, Sec. 8 of the Constitution authorizes Congress to issue *copyrights* to authors and *patents* to inventors. There is no limitation to science in the strict sense of the word, nor to the useful as distinguished from the fine arts. All books, maps, charts, musical compositions, engravings, photographs (or negatives), chromos, statues, etc., whatever the subject may be, are included, and so are all inventions.

In England, authors have rights to their works by common law as well as by statute; but in this country the right is derived entirely from legislation. Prior to the adoption of the

Constitution, the States granted copyrights, and the first act of Congress on the subject recognized the rights thus granted. The first law gave to the authors the exclusive right to their works for 14 years, with liberty of renewal for a like period. In 1832 the term was made 28 years, with the right to renew for 14 years longer. The present law is as follows :

Section 4952 of the Revised Statutes of the United States, in force December 1, 1873, as amended by the act of June 18, 1874, as amended by the act of March 3, 1891, provides that the author, inventor, designer or proprietor of any book, map, chart, dramatic or musical composition, engraving, cut, print, or photograph or negative thereof, or of a painting, drawing, chromo, statuary, and of models or designs intended to be perfected as works of the fine arts, and the executors, administrators, or assigns of any such person, shall, upon complying with the provisions of this chapter, have the sole liberty of printing, reprinting, publishing, completing, copying, executing, finishing, and vending the same; and, in the case of a dramatic composition, of publicly performing or representing it, or causing it to be performed or represented by others. And authors or their assigns shall have exclusive right to dramatize or translate any of their works for which copyright shall have been obtained under the laws of the United States.

A printed copy of the title of the book, map, chart, dramatic or musical composition, engraving, cut, print, photograph or chromo, or a description of the painting, drawing, statue, statuary, or model or design for a work of the fine arts, for which copyright is desired, must be delivered to the Librarian of Congress, or deposited in the mail, within the United States, prepaid, addressed "LIBRARIAN OF CONGRESS, WASHINGTON, D. C." This must be done on or before day of publication in this or any foreign country.

The printed title required may be a copy of the title-page of such publications as have title-pages. In other cases, the title must be printed expressly for copyright entry, with name of claimant of copyright. The style of type is immaterial, and the print of a typewriter will be accepted. But a separate title is required for each entry, and each title must be printed on paper as large as commercial note. The title of a periodical must include the date and number; and each number of a periodical requires a separate entry of copyright.

The legal fee for recording each copyright claim is 50 cents, and for a copy of this record (or certificate of copyright under seal of the office) an additional fee of 50 cents is required, making \$1, if certificate is wanted, which will be mailed as soon as reached in the records. In the case of publications which are the production of persons not citizens or residents of the United States, the fee for recording title is \$1, and 50 cents additional for a copy of the record. Certificates covering more than one entry in one certificate are not issued.

Not later than the day of publication in this country or abroad, two complete copies of the best edition of each book or other article must be delivered, or deposited in the mail within the United States, addressed "LIBRARIAN OF CONGRESS, WASHINGTON, D. C.," to perfect the copyright.

The freight or postage must be prepaid, or the publications enclosed in parcels covered by printed Penalty Labels, furnished by the Librarian, in which case they will come FREE by mail (not express), without limit of weight, according to rulings of the Post Office Department. Books must be printed from type set or plates made in the United States; photographs from negatives made in the United States; chromos and lithographs from drawings on stone or transfers therefrom made in the United States. Without the deposit of copies above required, the copyright is void, and a penalty of \$25 is incurred. No copy is required to be deposited elsewhere.

The law requires one copy of each new edition wherein any substantial changes are made to be deposited with the Librarian of Congress.

No copyright is valid unless notice is given by inserting in every copy published, on the title-page, or the page following, if it be a book; or if a map, chart, musical composition, print, cut, engraving, photograph, painting, drawing, chromo, statue, statuary, or model or design intended to be perfected as a work of the fine arts, by inscribing upon some portion thereof, or on the substance on which the same is mounted, the following words, viz.: "Entered according to act of Congress, in the year —, by —, in the office of the Librarian of Congress, at Washington," or, at the option of the

person entering the copyright, the words: "Copyright, 18—, by —"

The law imposes a penalty of \$100 upon any person who has not obtained copyright who shall insert the notice, "Entered according to Act of Congress," or "Copyright," etc., or words of the same import, in or upon any book or other article.

The copyright law secures to authors and their assigns the exclusive right to translate or to dramatize any of their works; no notice is required to enforce this right.

The original term of copyright runs for 28 years. Within six months before the end of that time, the author or designer, or his widow or children, may secure a renewal for the further term of 14 years, making 42 years in all.

Applications for renewal must be accompanied by printed title and fee; and by explicit statement of ownership, in the case of the author, or of relationship, in the case of his heirs, and must state definitely the date and place of entry of the original copyright. Within two months from date of renewal the record thereof must be advertised in an American newspaper for four weeks.

The time of publication is not limited by any law or regulation, but the courts have held that it should take place within a reasonable time. A copyright may be secured for a projected as well as for a completed work. But the law provides for no caveat, or notice of interference—only for actual entry of title.

Copyrights are assignable by any instrument of writing. Such assignment, to be valid, is to be recorded in the office of the Librarian of Congress within 60 days from execution. The fee for this record and certificate is \$1, and for a certified copy of any record of assignment, \$1.

A copy of the record (or duplicate certificate) of any copyright entry will be furnished, under seal of the office, at the rate of 50 cents each.

In the case of books published in more than one volume, or of periodicals published in numbers, or of engravings, photographs, or other articles published with variations, a copyright must be entered for each volume, or part of a book, or number of a periodical, or variety, as to style, title, or inscription, of any other article. To complete the copyright on a book published serially in a periodical, two copies of each serial part, as well as of the complete work (if published separately), should be deposited.

To secure copyright for a painting, statue, or model or design intended to be perfected as a work of the fine arts, a definite title and description must accompany the application for copyright, and a photograph of the same, as large as "cabinet size," mailed to the Librarian of Congress not later than the day of publication of the work or design. The fine arts, for copyright purposes, include only painting and sculpture, and articles of merely ornamental and decorative art should be sent to the Patent Office as subjects for Design Patents.

Copyrights cannot be granted upon trade-marks, nor upon names of companies or articles, nor upon an idea or device, nor upon prints or labels intended to be used for any article of manufacture. If protection for such names or labels is desired, applications must be made to the Patent Office, where they are registered, if admitted, at a fee of \$6 for labels and \$25 for trade-marks.

This is the law for domestic copyright. At last, after years of endeavor, an international copyright law has been passed.

The provisions as to copyright entry in the United States by foreign authors, etc., by act of Congress approved March 3, 1891 (which took effect July 1, 1891), are the same as the foregoing, except as to productions of persons not citizens or residents, which must cover return postages, and are \$1 for entry, or \$1.50 for entry and certificate of entry (equivalent to 4s. 5d. or 6s. 7d.). All publications must be delivered to the Librarian at Washington free of charge. The free penalty-labels cannot be used outside of the United States.

The rights of citizens or subjects of a foreign nation to copyright in the United States extends by Presidential proclamations to Great Britain, France, Belgium, Switzerland, Germany, Italy, Denmark, and Portugal.

Every applicant for a copyright should state distinctly the full name and residence of the claimant, and whether the right is claimed as author, designer, or proprietor. No affidavit or witness to the application is required.

International copyright arrangements between the

United States and foreign countries now include Great Britain and her possessions, France, Germany, Italy, Belgium, Portugal, Denmark, and Switzerland.

For an American citizen to secure copyright in Great Britain, three conditions are necessary:

1. The title should be entered at Stationers' Hall, London, the fee for which is 5s. sterling, and 5s. additional if a certified copy of entry is required.

2. The work must be published in Great Britain or in her dominions simultaneously with its publication in the United States.

3. Five copies of the publication are required—one for the British Museum and four on demand of the Company of Stationers for four other libraries.

Copyright may be secured in France by a foreigner by depositing two copies of the publication at the Ministry of the Interior at Paris. No fee nor entry of title required.

To secure copyright in Belgium a foreigner may register his work at the Department of Agriculture, Industry and Public Works at Brussels.

In Switzerland, register of title at the Department of Commerce and Industry at Berne is optional, not obligatory; fee two francs. If registered, deposit of one copy is required.

The Librarian of Congress cannot take charge of any copyright entries or arrangements with other countries.

Concerning the infringement of copy, the Librarian of Congress makes the following statement to inquiries as to remedies for infringement of copyright:

No question concerning the validity of a copyright can be determined under our laws by any other authority than a United States court.

This office has no discretion or authority to refuse any application for a copyright coming within the provisions of the law, and all questions as to priority or infringement are purely judicial questions, with which the Librarian has nothing to do. A certificate of copyright is *prima facie* evidence of an exclusive title, and is highly valuable as the foundation of a legal claim to the property involved in the publication.

As no claim to exclusive property in the contents of a printed book or other article can be enforced under the common law, Congress has very properly provided the guarantees of such property, which are embodied in the "Act to revise, consolidate, and amend the statutes relating to patents and copyrights," approved July 8, 1870. If you obtain a copyright under

the provisions of this act, you can claim damages from any person infringing your rights by printing or selling the same article; but upon all questions as to what constitutes an infringement, or what measures of damages can be recovered, all parties are left to their proper remedy in the courts of the United States.

CORNERS.—A corner in commerce may be defined as the purchase or contract to purchase enough of a commodity to enable one to fix its price. A man who corners a market usually agrees to take at a future date enough of a commodity to enable him to fix its price, and compel the speculators who have promised to sell at that time, thinking that they could buy cheap, to buy instead at the terms fixed by himself at an advanced price. For instances of cornered market and the fortunes thus made and the speculators and dealers ruined, see SPECULATION.

CORN LAWS were certain laws in England repealed in 1846, but coming down from most ancient times, restricting the trade in grain. The first corn laws are at least as old as 1360, of the reign of Edward III., while even before that date there seems to have been a general prohibition of the exportation of corn. The object of prohibiting exportation was to prevent the price of grain rising too high. There were continual changes in the corn laws. By an act of 1436 it could only be exported when the price of wheat was below 6s. 8d. In 1463 this was exactly reversed. By some laws it could only be exported when and where the king decreed.

The law depended on the class in power. In 1670 the land interest got a law passed forbidding importation, unless the price was 53s. 4d. or more. At the time of the Revolution a bounty was awarded on exportation. (See BOUNTIES.) For a century the law oscillated from import duty to bounty. In 1773, by Burke's act, exportation was prohibited when the price reached 44s.; at 48s. it allowed importation at a normal duty of 6d. It was claimed that this kept the price down in the interests of the poor, and that even a bounty worked in the same way, since it encouraged the raising of more corn than was needed, and so tended to lower the price. By acts of 1814 and 1828 a sliding scale was fixed. Gradually the contest over the corn laws became very bitter. Supporters of the laws claimed that protecting grain raising helped the country by bringing poor land into cultivation and employing men; that it tended to free the country from foreign dependence; that it enabled the landed proprietors to patronize manufactures. These views were mainly held by the landed interests and by most of the working classes. On the other hand, the free traders, led by Cobden and Bright, used the well-known arguments for free trade (*q. v.*). In 1843 Sir Robert Peel tried a modification of the sliding scale, and finally, through the exertions of the Anti-Corn Law League, the laws were repealed in 1846. The results have not met the extreme fears or claims of either side. Evil prognostications have not been fulfilled, and the prices have not fallen, as was hoped. (For the principles involved, see FREE TRADE and PROTECTION.)

CORPORATIONS.—A corporation may be defined, in general, as a body formed and authorized by law to act as a single individual in carrying out the purposes for which it is incorporated. It is the creature of the state, and can do only that which it is allowed to do by the state in the act which gives it birth, but within those limits it can act as freely as any individual. Corporations are usually divided into public and private corporations.

"Over the former the Legislature, as the trustee or guardian of the public interests, has the exclusive and unrestrained control; and acting as such, as it may create, so it may modify or destroy, as public exigency requires or recommends. . . . Private corporations, on the other hand, are created by an act of the Legislature, which, in connection with its acceptance, is regarded as a *compact*, and one which, so long as the body corporate faithfully observes, the Legislature is constitutionally restrained from impairing, by annexing new terms and conditions, onerous in their operation, or inconsistent with a reasonable construction of the compact." (*Angell and Ames on Corporations*, § 31, chap. 1.)

Corporations are of comparatively recent growth. Says Professor Ely, in his articles on *The Growth of Corporations*, in *Harper's Magazine* for 1887:

"In 30 years, in the second half of the eighteenth century, only one corporation was formed in Massachusetts, and that was of an eleemosynary character. When Alexander Hamilton wrote his celebrated report on the establishment of the First United States Bank in 1790, there existed only three banking corporations in the United States. Some estimate that railway corporations own one fourth of the wealth of the country, but they did not begin to exist until

more than half a century had elapsed after the promulgation of the Declaration of Independence. Gas companies, which have been so fruitful a source of corruption in States and municipalities, did not exist at all in the eighteenth century, and not in large numbers much before 1820. Manufactures were carried on in the last century in insignificant shops by men of little wealth and of no great social importance."

It was the general opinion a hundred years ago that corporations or joint-stock companies could not succeed, because they did not appeal to the stimulus of self-interest as much as private concerns, and therefore must go down in competition with them. The opinion of Adam Smith, in his *Wealth of Nations* (1776), is well known when he says :

"The trade of a joint-stock company is always managed by a court of directors. This court, indeed, is frequently subject in many respects to the control of a general court of proprietors. But the greater part of those proprietors seldom pretend to understand anything of the business of the company. . . . The directors of such companies, however, being the managers rather of other people's money than of their own, it cannot well be expected that they should watch over it with the same anxious vigilance with which the partners in a private copartnership frequently watch over their own. Like the stewards of a rich man, they are apt to consider attention to small matters as not for their master's honor. . . . Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs in such a company. . . . That a joint-stock company should be able to carry on successfully any branch of foreign trade, when private adventurers can come into any sort of open and fair competition with them, seems contrary to all experience. . . . The only trades which it seems possible for a joint-stock company to carry on successfully, without an exclusive privilege, are those of which all the operations are capable of being reduced to what is called a routine, or to such uniformity of method as admits of little or no variation."

Nevertheless corporations, altho only comparatively recently of large growth, have existed at least some 400 years. Says Professor Ely, in the article mentioned above :

"The earliest home of the corporation engaged in the pursuit of gain appears to have been Italy. In the fifteenth century creditors of the State put together their claims—their bonds, as we should say—and used them as the basis of a banking business. The first one of these banking corporations was the Bank of Genoa, founded in 1407. The seventeenth century is remarkable for the number of celebrated, indeed, one may say epoch-making, joint-stock companies for foreign trade, created in Holland, France, and England. The first of these great corporations for international trade was the Dutch East India Company, founded in 1602. Other companies followed in Holland, and the English East India Company, destined to play a rôle in the world's history, was established in 1600 and received a charter modelled on that of the Dutch East India Company in 1613. Other companies were soon formed, and some of them assisted in the development of the American continent. The London Company, the Plymouth Company, and the Hudson Bay Company may be mentioned. France followed in 1628 with the *Compagnie des Indes Occidentales*, and in 1664 with the *Compagnie des Indes Orientales*. Germany did not begin the creation of trading corporations so early, and there appears to be no record of any such institution before the foundation of the *Wiener Orientalische Compagnie* in 1710.

"Banking corporations were created in the seventeenth and eighteenth centuries in Sweden, England, Germany, Holland, and elsewhere. Some of these banks were of vast national and international importance, but there were comparatively few of them. Burke tells us that in 1750 there were in England not more than '12 bankers' shops out of London.'

"Stock-jobbing and corporate swindling flourished at an early date. Laws were passed in Holland in 1621, 1624, and in 1677 to check speculation and to protect the public. In 1720 we have in France the disastrous failure of John Law's notorious *Compagnie des Indes*, better known as the Mississippi Company. . . .

"The reaction against corporations was so extreme in England that joint-stock companies, save such as

should be chartered by royal grant or by Parliament, were forbidden by the 'Bubble Act' of 1720, and it was not until 1855 that associations with limited liability could be called into existence otherwise than by special act."

To-day, however, almost all large business interests are conducted by corporations. In the single State of Texas 80 charters were granted in 90 days in 1885. Professor Ely in the above article estimates the wealth of corporations in the United States at one fourth of the total wealth, and quotes Abram S. Hewitt as stating that corporations now own from one half to one third the capital of the civilized world. Another authority declares, too, that the wealth of corporations in the United States is increasing three or four times as fast as that of private concerns. According to an estimate made by the English *Economist* of November 6, 1886, the accumulation of capital in England between 1875 and 1885 amounted to nearly £1,000,000,000, of which £186,000,000 was attributed to "home railways," and £200,000,000 to other joint-stock companies, or nearly 40 per centum of the increase belonged to corporations.

The New York *World* of December 21, 1895, estimates the British holdings in American companies as follows :

Railroad stocks and bonds.....	\$1,250,000,000
Mines	150,000,000
Gaslight companies.....	50,000,000

Such are a few statistics illustrating the gigantic part played to-day by corporations. Naturally there arise from such a situation difficult industrial and social problems. Business is to-day passing out of individual *responsibility*. Individuals may yet control and guide business on a large scale, but they do it usually through corporations, and therefore the responsibility falls on the corporation, not, at least technically, upon them. This gives rise to the expression "soulless corporation." Corporations are managed usually by a small body of directors, and the shareholders often know little if anything of the details of the management. Now the directors being paid to manage the business for the stockholders, to do this faithfully and to consider only the interests of their stockholders is considered the one duty of the director. Therefore even upright and honest directors are apt to forget all other elements in the conduct of their business but the making of the largest dividends that shrewd management will allow. As a result, the condition of the employees of the corporation and the effect of the business upon the public are often utterly overlooked; not seldom, too, even the directors of a corporation know themselves nothing or little about the condition of their employees. This is usually left to the treasurer or the department "boss," who hires the hands, pays them, and is the only one of the management who comes into direct contact with the "hands." His interest and his hope of advancement lie in being able to buy labor and material cheap and sell the product at good prices. That is what he is hired to do. As a result, there is often a complete divorce of the employees and the stockholders, who are yet really the legally responsible party. Often, too, the stock changes hands. American mining stock, for instance, may be owned one day

by an English lord, the next by a Scotch capitalist, the third by a German baron, again by an American widow. Under such shifting ownership individual responsibility of ownership becomes very vague, and great moral evils naturally result. Individualists would meet the difficulty by appeal to a deeper ethical sense of responsibility, both among stockholders and directors; socialists assert that corporations, having already socialized industry in the interests of the few, the only way out is now to socialize it in the interests of the many, and put it under the control and operation of the responsible community. They argue that the development of corporations and monopolies is making socialism easy. Business to-day is conducted by salaried managers for bodies of private men. What can be easier, they ask, than for these trained managers to do exactly the same thing for the body politic? Socialism can thus come, they assert, with a modicum of change in present methods, perhaps by the public simply buying the stock. (See COMPENSATION; SOCIALISM; MONOPOLIES; TRUSTS, etc.)

CORRUPTION IN POLITICS.—Under their respective heads we consider special kinds or cases of corruption. (See ASSESSMENTS; BROADWAY STEALS; CONTRACT LABOR; JOBS; LEXOW INVESTIGATION; PLUTOCRACY; STANDARD OIL MONOPOLY; TAMMANY; WHISKY RING, etc.; see also CITIES; CIVIL SERVICE REFORM.) We record here the conclusions of some careful investigators and students of general conditions.

Professor Jeremiah W. Jenks, of Cornell University, writing in *The Century Magazine* for October, 1892, on *Money in Practical Politics*, gives the following facts as to corruption among voters:

"The proportion of voters who are subject to money influence is very great. I have had estimates given me many times by men whose knowledge is based upon experience, and I find that the localities are not very uncommon where from 10 to 35 per cent. of the voters are purchasable. In one county in New York, in which, perhaps, the Mugwump vote is larger in proportion to the total vote than in any county in the State, and in which the largest city has some 12,000 inhabitants, about 20 per cent. of the voters were purchased in 1888. . . . The evil is not confined to the cities nor to any one State. The probability is that, all things considered, in such a State as New York the farmers are as corrupt as the residents of the cities."

Professor Jenks points out how the politician classifies the voters under his jurisdiction as Republicans, Democrats, and "doubtfuls;" the author then says:

"These doubtful voters will not be divided carelessly into 'blocks of five and each block put into the hands of a trusty man,' but each doubtful voter, being known, with his habits, his work, his associates, is considered individually. If he is one whose vote can be affected by honest persuasion, the man in the party who would be likely to have most influence with him is selected to work with him, and to influence his vote by fair means, if possible. If he is a man whose vote must be purchased, he is assigned to the worker who can purchase him to the best advantage. If the number of 'floaters' or 'commercials,' as they are variously called, is relatively large to the number of workers, it may well be that they will have to be purchased in blocks of fives or blocks of tens; or, again, owing to social reasons, they at times can best be bought in groups or clubs, or traded; but in all cases where the best work is done, each individual 'floater,' whether bought singly or as one of a group, is looked after personally by the man best competent to handle him."

The same issue contains, in editorial comment on Professor Jenks's article, the following significant statement:

"In Rhode Island, for example, where money has been used corruptly in every election since the war, and in some before and during the war, there are known to be about 5000 purchasable voters in a total of 54,000, or nearly 10 per cent. of the whole number. These are distributed over the State, ranging from 10 in the smaller towns to 1000 in the cities, but in every case their names and individual prices are matters of record. . . . Prices range from \$2 to \$5 a head, according to demand."

Speaking in confirmation of what Professor Jenks has said regarding the keeping of poll books in which voters are classified according to their politics and their incorruptibility or venality, the editor of the *Century* adds:

"In some sections of the State [New York] the number of purchasable voters enrolled on these books is said to exceed the number of those belonging to either party. What is true of New York is, in a greater or less degree, true of nearly every other State of the Union in which the strength of the two great parties is evenly balanced."

The editor of *The Nation*, discussing the price of votes (vol. lv., p. 274), declares that they have "gone up" in New York.

"The very careful and trustworthy observer who has been traveling in the interior of the State for the *Evening Post*, reports that votes which could be had for 'the defense of American industry' for \$5 in 1888 are now held firm at \$20 apiece."

One of the most noteworthy investigations of recent times was made by Professor J. J. McCook, of Hartford, Conn., published in *The Forum* for September, 1892, in which, from secret lists furnished him by politicians, he constructs tables for 20 towns and one city in Connecticut, showing the number of votes that are known to politicians to be purchasable. He finds that 15.9 per cent. of the whole number of votes is venal.

Says Mr. C. N. Gregory, in a paper read before the Historical and Political Science Association of the University of Wisconsin:

"The political corruption of a considerable percentage of voters is commonly confessed, and this percentage is a danger and injury to all the rest. The periodicals have abounded in articles upon this subject within the past year. In some parts of New York the number of purchasable voters is said to exceed that of those who cannot be bought, and this statement finds a place in the most influential magazine of that State. In Rhode Island it is computed at about 10 per cent. Professor J. J. McCook in a remarkable article in the *Forum*, and upon tables which are at least persuasive, finds about 16 per cent. of the voters in Connecticut purchasable. I do not believe so large a percentage in our own State is venal, but no one can touch practical politics, or talk confidentially with those who have touched them, without finding an amount of assessing, subscribing, treating, promising, and colorable hiring, shameful and degrading to voters and candidates alike.

"How small a percentage of corrupt change will affect results is surprising. At the recent election in Wisconsin for 1892 there were 371,550 votes cast for governor, and the majority of Governor Peck over Colonel Spooner was 7508. From this it is plain that a change of but 15 votes more than 1 per cent. would have defeated Governor Peck, his doctrines, and his party, and seated Colonel Spooner and his friends, and Governor Peck's majority being larger than President Cleveland's in Wisconsin, a still smaller change would have reversed the result in the State as to the federal election."

Of municipal corruption, Andrew D. White, in *The Forum* for December, 1890, introduces an article on *The Government of American*

Cities with words which no honest citizen of these unfortunate municipalities will question :

"Without the slightest exaggeration, we may assert that, with very few exceptions, the city governments of the United States are the worst in Christendom, the most expensive, the most inefficient, and the most corrupt. No one who has any considerable knowledge of our own country and of other countries can deny this.

"Among our greatest municipalities, we naturally look first at New York and Philadelphia. . . . One has but to walk along the streets of these and other great American cities to notice at once that some evil principle is at work. Everywhere are wretched wharves, foul docks, inadequate streets, and inefficient systems of sewerage, paving, and lighting. Pavements which were fairly good at the beginning have been taken up and replaced with utter carelessness, and have been prematurely worn out or ruined. The stranger seeking to find his way in the first of these great cities is guided by a few signs giving the names of streets; in the most frequented quarters there are generally none at all. Obstacles of all sorts are allowed; tangled networks of wire frequently exist in such masses overhead as to prevent access to buildings in case of fire, and almost to cut off the rays of the sun. Here and there corporations or private persons have been allowed to use the streets in such manner as to close them to the general public. In wet weather many of the most important thoroughfares are covered with reeking mud; in dry weather this mud, reduced to a impalpable dust, containing the germs of almost every disease, is blown into the houses and into the nostrils of the citizens.

"The city halls of these larger towns are the acknowledged centers of the vilest corruption. They are absolutely demoralizing, not merely to those who live under their sway, but to the country at large. Such cities, like the decaying spots on ripe fruit, tend to corrupt the whole body politic. As a rule, the men who sit in the councils of our larger cities, dispensing comfort or discomfort, justice or injustice, beauty or deformity, health or disease, to this and to future generations, are men who in no other country would think of aspiring to such positions. Some of them, indeed, would think themselves lucky in keeping outside the prisons. Officials intrusted with the expenditure of the vast wealth of our citizens are frequently men whom no one would think of entrusting with the management of his private affairs, or, indeed, of employing in any capacity. Few have gained their positions by fitness or by public service; many have gained them by scoundrelism; some by crime."

In reading these statements of political corruption, however, it must not be thought that only politics are corrupt. The amount of corruption in private business can never be wholly known, but see STOCK-GAMBLING; MONOPOLIES; WATERED STOCK; STANDARD OIL MONOPOLY, etc. It must not be forgotten that much of the political corruption comes from private corporations. For facts upon this point, see PLUTOCRACY. As early as 1871, however, Charles Francis Adams said (chapters on Erie, p. 97) :

"Public corruption is the foundation on which corporations always depend for their political power. There is a natural tendency to coalition between them and the lowest strata of political intelligence and morality. . . . It is a new power for which our language contains no name. We know what aristocracy, autocracy, democracy are, but we have no word for government by moneyed corporations. . . . The influence of corporations and of class interests is steadily destroying that belief in singleness of purpose which alone enables a representative government to exist."

Of the causes of corruption, Professor Jenks writes in his *Century* article.

He begins with the assumption that corruption is "the fundamentally inherent vice of democratic government." He believes, however, that the mass of the people wish pure elections, and that corruption may be so limited as to do away with its serious effect on government. He finds the causes of electoral corruption as it exists to day in "natural motives and often good ones," and illustrates this apparent paradox by citing the influences brought to bear on German officials under Bismarck, to secure support of the government, from patriotic motives, and the subsidizing of the

press in France from the secret service fund, presumably in the interest of the country. "In like manner many an employer who, directly or indirectly, has coerced his employees into voting as he believes, feels that only his party's policy is right, and that his act is therefore laudable and in the workmen's interest. Many a party leader who has raised corruption funds and directed their expenditure has sincerely believed that his party could not win without bribery, and that the success of the opposition would be a far more serious evil to the country than the bribing of a few 'floaters' whose moral sense was already blunted. If the influence of bribery ended with the single act, the argument would be strong."

Professor Jenks goes on to show that the larger number of bribing politicians have far more selfish aims; they work for money and office, while a large proportion of the ignorant men who receive bribes are not even conscious that they are committing any serious wrong. Even the intelligent classes are not fully awake to the wrong involved, it would seem, since college students often receive traveling expenses to and from the polls from the party committees. "The nature of corruption and the difficulty of controlling it appear more clearly, too, when we consider its extent and the places where it is most prevalent. People who live in districts that are 'safe' for either party, especially if the people are also fairly well to do, have no conception of the subject. In such places, there is only here and there a case of corruption, and that is mostly some kind of treating given to add force to an argument, or it is covered under the head of paying for services at the polls. Where, however, the district is a close one, and the ignorant voters are numerous, the proportion treated or bribed is high. In such districts it is uncommon for 25 to 50 per cent. to be thus managed, while cases are found—as they have been found in similar circumstances in England and elsewhere, for we are no worse by nature than other people—where nearly all the voters are corrupted. As was said at the beginning, corruption is the normal condition of a country with many ignorant voters and great electoral prizes. It will always be found, unless special measures are taken to prevent it."

For reform methods in dealing with corruption, see CORRUPT PRACTICES ACT; CIVIL SERVICE REFORM; MUNICIPAL REFORM MOVEMENTS; CITY, etc.

THE MASSACHUSETTS LAW.

In 1892 Massachusetts enacted a law that approaches nearer to the English act than any American measure yet passed. It applies to all public elections, including elections by the Legislature or by city council, and nominations by caucus or convention. The only exception to it is the election of town officers in towns. It provides for a complete and public account of all political expenditures. This is its main feature; but it falls short of the English act by not restricting the amount to be spent and by not specifying legal objects of expenditure. With the exception of personal expenses, no candidate is allowed any expenditure to secure his own election otherwise than through a political committee. This political committee is held responsible for violations of the law.

The law defines the term "political committee" to include "every committee or combination of three or more persons who shall aid or promote the success or defeat of a political party or principle in a public election, or shall aid or take part in the nomination, election or defeat of a candidate for public office." It furthermore provides that every individual who, "acting otherwise than under the authority and in the behalf of a political committee," receives or disburses money for any of the above-named purposes, shall be subject to the requirements of the act. "Every such committee is required to have a treasurer, who must, within 30 days after an election, if the total receipts or expenditures of the committee exceed \$20, file a sworn statement 'setting forth all the receipts, expenditures, disbursements and liabilities of the committee and of every officer and other person acting under its authority and in its behalf.' A voucher, 'stating the particulars of expense,' must be kept for every payment of over five dollars. Thus the whole subject-matter of

political expenditures, by whomsoever made, is intended to be brought within the scope of the law and made a matter of record and public concern."

Political committees are not permitted to ask candidates for money, but candidates may make voluntary contributions. An organization has been formed known as the Election Laws League of Massachusetts, to watch over the enforcement of the law. This league has thus far been free from partisanship, and reports encouraging progress. Hon. Josiah Quincy, Assistant Secretary of State of Massachusetts, writes thus of the law in *The Forum*:

"While it cannot be said that there has been any very active or widespread public interest in the operation of the law, as was the case when the Australian ballot system was introduced, there has thus far been no declared opposition, but a strong public sentiment in its favor, and the leading newspapers have given to it their full support. The mere publicity given to the expenses incurred has undoubtedly tended somewhat to limit their amount and restrict their purposes, and this tendency may be found to increase. But the law did not on its first trial work a very marked change in either of these respects. The requirement as to the publication of the names of contributors undoubtedly tended to check contributions, and it was found that many who had been accustomed to give money liberally for political purposes, from purely unselfish and public-spirited motives, were seriously disinclined to face the necessary publicity. The fact that a national election was pending, however, allowed such persons to send their contributions to the respective national committees to be appropriated for use in Massachusetts, the result being that both the Republican and Democratic State Committees returned their respective national committees as contributing over \$20,000 each to their funds. This requirement at the time of the passage of the law met with the opposition of many persons who were otherwise friendly to its provisions, and it is still an open question whether it is not susceptible of too easy evasion."

NEW YORK CORRUPT PRACTICE ACT.

This has been characterized as the "weakest of our American laws to restrict the spending of money for election purposes." Instead of demanding an account of expenditures from the political committee, it requires it of the candidate. As has been shown by several trials of the law, the candidate names sundry unimportant and legitimate expenses of his own, and then gives the amount which he has handed over to the political committee. There is no investigation as to what the committee has done with the money. The candidate may in various ways evade the law—by giving money indirectly to the committee, or by falsifying his returns. The public gains only a more or less correct idea of the "assessments" paid by candidates for the "honor" conferred upon them by nomination. See also MUNICIPAL REFORM LEAGUE and LAW AND ORDER LEAGUE.

CORRUPT PRACTICE ACT.—The agitation against political corruption in this country has drawn attention to the Corrupt Practice Act, which has been passed in England, and has been in general copied in Massachusetts and to a less extent in New York, and is being considered in other States.

The present British Corrupt Practice Act, of which Sir Henry James was author, was passed in 1833. Previous to 1833 there were three corrupt practices known to the law in England: bribery, treating, and undue influence. The act of that year added a fourth, by declaring that "personation, and the aiding, abetting, counseling, and procuring the commission of the offense of personation," should be a corrupt practice.

The British law is very explicit in its definition of bribery. "Every person is pronounced guilty of it who directly or indirectly, by himself or by any other person, gives, lends, or agrees to give or lend, or offers, promises, or promises to procure, or to endeavor to procure, any money or valuable consideration, or any office, place, or employment, to or for any voter, or to or for any person on behalf of any voter, or to or for any person in order to induce any voter to refrain from voting, or who in any similar manner seeks to induce any person to procure or endeavor to procure the return of any person to parliament or the vote of any voter at any election. Every person is also pronounced guilty of bribery who, in consequence of any of the forbidden acts mentioned, procures or endeavors to procure the election of a candidate, or who advances or pays or causes to be paid any money to or to the use of any other person with the intent or knowledge that it shall be expended wholly or in part in bribery; and every voter who, directly, receives, either before or during election, any consideration of the kind forbidden in the anti-bribery provision above summarized, either for voting or refraining from voting, is also pronounced guilty of bribery; as also is any person who, after election, directly or indirectly, by himself or by any other person in his behalf, receives any money or valuable consideration on account of any person having voted, or refrained therefrom, or having induced any other person to vote or refrain from voting."

Treating is also forbidden with explicitness. "Any person is pronounced guilty of it who corruptly or by himself, or by any other person either before, during or after an election, directly or indirectly gives or provides, or pays wholly or in part the expenses of giving or providing any meat, drink, entertainment, or provision to or for any person for the purpose of corruptly influencing his vote, or inducing him to refrain from voting, or on account of himself or any other person having voted or refrained from voting, or being about to do one of these things; and every voter who accepts such forbidden attentions is equally guilty."

"In regard to undue influence, every person is guilty of that who directly or indirectly, by himself or by any other person in his behalf, makes use of or threatens to make use of any force, violence or restraint, or inflicts or threatens to inflict by himself or by any other person any temporal or spiritual injury, damage, harm or loss upon or against any person to induce or compel him to vote or to refrain from voting, or on account of his having done either of these things, or who by abduction, duress or any fraudulent device or contrivance impedes or permits the free exercise of the franchise of any elector. Personation is also defined and forbidden."

The penalties attached to a conviction of these offenses are for bribery, treating, and undue influence, each of which is a misdemeanor, imprisonment with or without hard labor for a term not exceeding one year, or a fine not exceeding 200 pounds; for personation, which is a felony, for a term not exceeding two years with hard labor. If it is found by the election court that the offenses of treating, or undue influence, have been committed by a candidate, or that the offenses of bribery and personation have been committed by or with his knowledge or consent, he is declared ineligible ever after to hold a seat in the House of Commons in the county or borough in which the offenses were committed.

To prevent objectionable expenditures, the law restricts the employment of agents, clerks, messengers and others within a very narrow limit. "Voluntary efforts are made to take the place of paid labor. But it was anticipated that there would be a strong desire to evade such a restriction by making contracts to carry on the election work in place of the candidate employing persons for that purpose. And so the plan of controlling the amount of expenditure by a fixed schedule was accepted, and it has certainly proved most beneficial in practice. By the eighth section of the act it is enacted that no sum shall be paid and no expenses incurred by any candidate in excess of any maximum amount in that behalf specified in the first schedule to the act. Any breach of this prohibition by a candidate or his election agent is an illegal practice."

From \$1000 to \$3500 is the maximum amount which may be expended in a parliamentary election. As a result of this law there has been a thorough reformation in British election methods, rendering them at least as pure as those of any country. In most localities corrupt prac-

tices have ceased to exist. Since the operation of the law no member has been unseated for bribery, and three general elections have been held.

CORVÉE, a tax levied on the laboring classes, and paid by them in a certain number of days of labor, either wholly unremunerated or remunerated at a rate less than the ordinary rate of wages. In particular such taxation has been applied to the construction and maintenance of roads and bridges, each locality being compelled to defray the cost of such works by contributions of labor. It is a system that has come down from feudal times, when the serf was compelled to give his lord a certain amount of labor. It exists to-day in certain European and some not wholly civilized countries. (See **TAXATION**.)

COSSA, LUIGI, was born in 1831 at Milan. He received the degree of LL.D. from the University of Pavia in 1853. In 1860 he was made full professor of political economy at Pavia, and later in the University of Milan. Cossa, well known also abroad as a *littérateur*, is to-day one of the most prominent of Italian thinkers upon political economy, and from his school have come most of the younger economists. His style as an author is distinguished for its conciseness. His best-known works are his *Guide to the Study of Political Economy* (translated from the second Italian edition [1877] 1880), considered by many not always accurate, but still the most complete manual of its kind, and his *Taxation, its Principles and Methods* (1888).

COST OF LIVING. See **EXPENDITURES**.

COST OF PRODUCTION.—Cost of production may be defined as the amount of exertion or sacrifice requisite to the production of any article. Says Professor Marshall in his *Elements of Economics of Industry* (p. 214):

“The exertions of all the different kinds of labor that are directly or indirectly involved in making it; together with the abstinences or rather the waitings required for saving the capital used in making it; all these efforts and sacrifices together will be called its real cost of production. The sums of money that have to be paid for these efforts and sacrifices will be called either its money cost of production, or, for shortness, its expenses of production; they are the prices which have to be paid in order to call forth an adequate supply of the efforts and waitings that are required for making it; or, in other words, they are its supply price.”

Marshall adds in a note:

“Mill and some other economists have followed the practice of ordinary life in using the term cost of production in two senses, sometimes to signify the difficulty of producing a thing, and sometimes to express the outlay of money that has to be incurred in order to induce people to overcome this difficulty and produce it. But by passing from one use of the term to the other without giving explicit warning, they have led to many misunderstandings and much barren controversy.”

Concerning the analysis of the various elements which enter into the cost of production, Mill says (*Principles of Political Economy*, Book III., chap. iv.):

“The component elements of cost of production have been set forth in the first part of this inquiry. The principal of them, and so first the principal as to

be nearly the sole, we found to be labor. What the production of a thing costs to its producer, or its series of producers, is the labor expended in producing it. If we consider as the producer the capitalist who makes the advances, the word labor may be replaced by the word wages: what the produce costs to him is the wages which he has had to pay. At the first glance indeed this seems to be only a part of his outlay, since he has not only paid wages to laborers, but has likewise provided them with tools, materials, and perhaps buildings. These tools, materials, and buildings, however, were produced by labor and capital; and their value, like that of the article to the production of which they are subservient, depends on cost of production, which again is resolvable into labor. The cost of production of broadcloth does not wholly consist in the wages of weavers, which alone are directly paid by the cloth manufacturer. It consists also of the wages of spinners and woolcombers, and it may be added, of shepherds, all of which the clothier has paid for in the price of yarn. It consists too of the wages of builders and brickmakers, which he has reimbursed in the contract price of erecting his factory. It partly consists of the wages of machine-makers, iron-founders, and miners. And to these must be added the wages of the carriers who transported any of the means and appliances of the production to the place where they were to be used, and the product itself to the place where it is to be sold. . . .

“But in our analysis, in the first book, of the requisites of production, we found that there is another necessary element in it besides labor. There is also capital; and this being the result of abstinence, the produce, or its value, must be sufficient to remunerate, not only all the labor required, but the abstinence of all the persons by whom the remuneration of the different classes of laborers was advanced. The return for abstinence is profit. And profit, we have also seen, is not exclusively the surplus remaining to the capitalist after he has been compensated for his outlay, but forms in most cases no unimportant part of the outlay itself. The flax-spinner, part of whose expenses consists of the purchase of flax and of machinery, has had to pay, in their price, not only the wages of the labor by which the flax was grown and the machinery made, but the profits of the grower, the flax-dresser, the miner, the iron-founder, and the machine-maker. All these profits, together with those of the spinner himself, were again advanced by the weaver, in the price of his material, linen yarn; and along with them the profits of a fresh set of machine-makers, and of the miners and iron-workers who supplied them with their metallic material. All these advances form part of the cost of the production of linen. Profits, therefore, as well as wages, enter into the cost of production which determines the value of the produce. . . .

“Besides the natural and necessary elements in cost of production—labor and profits—there are others which are artificial and casual, as, for instance, a tax. The tax on malt is as much a part of the cost of production of that article as the wages of the laborers. The expenses which the law imposes, as well as those which the nature of things imposes, must be reimbursed with the ordinary profit from the value of the produce, or the things will not continue to be produced.”

We come to a more vexed question when we ask if rent enters into the cost of production. Mill says:

“Does rent enter into the cost of production? and the answer of the best political economists is in the negative. The temptation is strong to the adoption of these sweeping expressions, even by those who are aware of the restrictions with which they must be taken; for there is no denying that they stamp a general principle more firmly on the mind than if it were hedged round in theory with all its practical limitations. But they also puzzle and mislead, and create an impression unfavorable to political economy, as if it disregarded the evidence of facts. No one can deny that rent sometimes enters into cost of production. If I buy or rent a piece of ground, and build a cloth manufactory on it, the ground rent forms legitimately a part of my expenses of production, which must be repaid by the product. And since all factories are built on ground, and most of them in places where ground is peculiarly valuable, the rent paid for it must, on the average, be compensated in the values of all things made in factories. In what sense it is true that rent does not enter into the cost of production or affect the value of agricultural produce will be shown in the succeeding chapter.”

He then goes on to argue the familiar principle that since there cannot long be two prices in an open market for the same thing, and since the amount of population creates a demand for land enough to raise the necessities of life, the price of such commodities must be fixed high enough to cover the cost of production on the most unproductive and expensive land that is needed. Into that price rent cannot enter, because if rent was paid for such land, people owning land of less value could produce the necessities of life without rent and bring down the price. Rent, therefore, cannot enter into the price of commodities produced at the land which fixes the price. People, it is true, owning better land can command a rent, because their land can produce more, or the same amount at less cost, and yet they can sell its products at the same price as that raised on poorer land. But this rent is gained from the superior market value of the land ; it does not enter into the cost of producing that which fixes the market value of any commodity. Mill sums up his view thus :

"Rent is not an element in the cost of production of the commodity which yields it, except in the cases (rather conceivable than actually existing) in which it results from and represents a scarcity value. But when land capable of yielding rent in agriculture is applied to some other purpose, the rent which it would have yielded is an element in the cost of production of the commodity which it is employed to produce."

Such is Mill's view, and practically all economists are agreed with him. Palgrave's *Dictionary of Political Economy* says :

"The fundamental law of cost (or rather expenses) of production may be thus stated: *The normal selling price of any article tends to be such as to yield the wages, interest, and profits involved in the expenses of production.* If the price is above this rate, labor and capital are attracted to the industry, the supply is increased, and the price falls; while conversely, if the remuneration is not so high, labor and capital are repelled and the price rises. But it must be observed that in any established industry, owing to the want of perfect mobility of labor and capital, the effect of a fall in price due to a lessened demand for the product on the part of other industrial groups may be to cause a quasi-permanent fall in the rates of wages and profits in that industry; and thus lower for a considerable time the expenses of production. (See WAGES.) If, however, we assume that mobility is perfect, or allow time for the full effect of the forces which determine wages and profits, the normal expenses of production are given in the law as stated.

"Besides labor and capital in the ordinary sense of the terms, raw material is required. This raw material, however, is itself the product of labor and capital, and so far would come under the analysis just given. But since Ricardo gave such prominence to the economic theory of rent, the text-books have emphasized the fact that raw material is more directly dependent upon natural sources of supply, and that these sources of supply may be exploited at unequal costs. This leads to the position that when there is a difference in the cost of producing the various parts of the normal supply, the normal price must be such as to give a fair return to that portion produced under most unfavorable circumstances.

"On the whole, it may be said that economic rent, if it can be actually separated from the other elements in cost according to the hypothesis assumed, does not enter into cost, but that practically other factors are closely combined with it to form rent in the popular acceptance of the term, and that, in this sense, rent often does form part of the cost."

(On the still more important and much more vexed question whether the cost of production determines market value, see VALUE.)

COTTON FAMINE, THE, was occasioned by the War of the Rebellion, declared in 1861. It created in England the greatest industrial depression. In 1860 the cotton trade of England had reached an enormous activity. There were 2650 mills, with 30,000,000 spindles, making from 4000 to 6000 revolutions per minute, and employing 440,000 hands, 56 per cent. of them women, 10 per cent. children. The fixed capital was £54,000,000; the wages paid that year, £11,500,000. Of the 1,391,000,000 lbs. of cotton imported, 1,120,000,000 lbs. came from the United States. April, 1861, Fort Sumter was bombarded. The Federal Government early established a blockade of the Southern ports. Only by running this blockade could cotton be sent to England. The price of cotton in Liverpool rose from 7½d. to 12d. The dealers made fortunes, but the mills gradually had to shut down. It was not that there was not cotton; at first there was plenty, but for the manufactured goods there was no market. There was a glut. In November 49 mills shut down and 119 worked half time. The distress among the low-paid operatives began to be intense. Relief committees were appointed, and soup kitchens opened. Cotton district relief funds were opened by Lancashire and some London papers. The Lord Mayor established a Mansion House committee, which received subscriptions from all over the world. In 1862 only 524,000,000 lbs. of cotton were imported. At Christmas of that year 247,000 were totally out of work, and 165,000 only partially employed; 234,000 were in receipt of relief. The rate of wages, however, was not reduced. The operatives were set against that. Relief came from the United States as well. Three vessels, the *George Griswold*, the *Achilles*, and the *Hope* were chartered and sent to Liverpool with food and clothing. In June a Public Works Act was passed, the Government advancing £1,200,000. Private subscriptions reached £2,000,000. But gradually the manufacturers sold off their stock and began manufacturing again at high prices, compelled by high raw material. (See CRISES.)

COTTON INDUSTRY, THE.—The oldest cotton-producing country of the world is India, the early mention of it is made in Egypt. In the United States the introduction of the plant is traced as far back as 1536, tho the export trade did not commence till about 1770, when a shipment of 2000 lbs. was made. In 1791 the shipments reached 189,316 lbs.; in 1800, 17,789,803 lbs.; in 1821, 124,000,000 lbs.; in 1831, 277,000,000 lbs.; in 1841, 530,000,000 lbs.; in 1851, 927,000,000 lbs.; in 1860, 2,160,000,000 lbs. Prices fell gradually from 1s. 6d. per pound in Liverpool in 1793, to 5½d. or 7d. After that the expansion of trade, and especially the War of the Rebellion and the abolition of slavery, raised prices to 8d. and occasionally above that, tho since 1875 they have fallen again. In 1871 a failure of the crop reduced the export of cotton to 933,000,000 lbs. Inventive genius, superior farming and energy have given the United States, however, a firm grasp upon the trade. For recent times the abstract of the eleventh census gives the following as the cotton crop of the United States :

YEAR	COTTON.	
	Acres.	Bales.
1890.....	20,175,270	7,472,511
1880.....	14,480,019	5,755,359
1870.....	3,011,996
1860.....	5,387,052
1850.....	2,469,093

	1893-94.	1890-91.	1887-88.
	Exports to Europe.....	Bales. 5,183,645	Bales. 5,750,443
Consumption U. S., Canada, etc.	2,508,850	2,642,912	2,259,606
Total.....	7,692,495	8,393,355	6,861,854

The division between the home and foreign consumption was as follows :

As to the cotton consumption of the world, the *World Almanac* gives the following :

CONSUMPTION BALES, 400 LBS.	Great Britain.	Total Europe.	United States.	India.	Total World.
1880-81.....	3,572,000	6,528,000	2,118,000	371,400	9,017,400
1881-82.....	3,640,000	6,838,000	2,197,000	380,600	9,424,600
1882-83.....	3,744,000	7,124,000	2,375,000	447,400	9,946,400
1883-84.....	3,666,000	7,046,000	2,244,000	520,700	9,810,700
1884-85.....	3,433,000	6,688,000	1,909,000	584,800	9,181,800
1885-86.....	3,628,000	7,093,000	2,278,000	630,300	10,001,300
1886-87.....	3,694,000	7,334,000	2,423,000	711,300	10,468,800
1887-88.....	3,841,000	7,637,000	2,530,000	771,670	10,938,670
1888-89.....	3,770,000	7,839,000	2,685,000	870,880	11,394,880
1889-90.....	4,016,000	8,296,000	2,731,000	988,293	12,015,293
1890-91.....	4,233,000	8,771,000	2,958,000	1,155,328	12,884,328
1891-92.....	3,977,000	8,401,000	3,220,000	1,142,619	12,863,619
1892-93.....	3,583,000	8,159,000	3,189,000	1,147,588	12,495,588
1893-94.....	4,040,000	8,824,000	2,830,000	1,199,234	12,853,234

As to the supply, the following is the estimate of Ellison & Co. for 1894-95 :

	Total.
	Bales.
America.....	8,248,000
East Indies.....	1,100,000
Other countries.....	1,192,000
Total.....	10,540,000
Average weight.....	468
Bales of 400 lbs.....	12,330,000

The importance of the cotton trade is very great, and has been almost wholly developed within a century. The invention of Wyatt's spinning-roller in 1730, of Kay's fly-shuttle in 1738, of Hargreaves' spinning-jenny in 1764, of Arkwright's water-frame (patented) in 1769, Crompton's mule in 1779, Cartwright's loom in 1785 in England, and Whitney's cotton-gin in 1793 in America, has created the trade. It is estimated in England that 4,500,000 persons depend for their livelihood on the condition of the cotton trade. For the United States the abstract of the eleventh census gives the following figures :

INDUSTRY.	Year.	Number of Establishments Reporting.	AVERAGE NUMBER OF EMPLOYEES AND TOTAL WAGES.		Cost of Materials Used.	Value of Products, including Receipts from Custom Work and Repairing.
			Employees.	Wages.		
Cotton, cleaning and rehandling.....	1890.....	13	210	\$54,068	\$415,005	\$525,595
	1880.....
Cotton, compressing.....	1890.....	52	3,000	1,228,619	254,309	2,624,027
	1880.....	29	1,008	573,005	326,808	1,271,700

COULANGES, NUMA DENIS, FUSTEL DE, was born in Paris in 1830. A member of the Institute and Director of the *École Normale Supérieure*, Fustel de Coulanges is best known in social science for his important studies in the history of early civilizations and primitive tenures of land and other property. His best-known works are : *La cité antique, étude sur le culte, le droit, les institutions de la Grèce et de Rome* (1864); *La Gaule Romaine; Histoire des institutions politiques de l'ancienne France* (7 vols.); and various essays, an important one of which, appearing in the *Revue des Questions Historiques* for April, 1880, has been translated into English under the title *The Origin of Property of Land*, edited by W. J. Ashley, M.A. (1891). It was *La cité antique* which gave De Coulanges his first name; his *Institutions* is his great life work. He died in 1889, before his work was completed, but a creator in the realm of historical economic research. He has freely criticised M. de Laveleye's theories of the communistic primitive property in land, arguing that property in land was always held on the seigniorial rather than the communal tenure.

COUNTY COUNCILS (English).—On March 19, 1888, Mr. C. T. Ritchie, for the Government (Conservative) of Lord Salisbury, introduced into Parliament a so-called Local Government Bill, which took a long step in the direction of self-government, and an important fact of which was the creation of county councils. Hitherto the government of England's counties and the conduct of county works had been conducted by a most complicated system of various local boards and bodies, created by numerous and sometime conflicting acts of Parliament. It had been long felt that the reform of local government was absolutely necessary. The new bill, therefore, was well received. It was, in the course of its various readings, much changed, but on July 19 the bill finally passed through committee. By this act (51 and 52 Vict. c. 41) England and Wales were divided into 60 administrative counties and 62 county boroughs. Over these were placed councils consisting of elected councilors and nominated aldermen. These councils are entrusted with the administrative and financial business of the county.

They can authorize the sanitary authorities to take land compulsorily for allotments; they maintain and control roads and bridges; enforce the River Pollution Prevention Act; license theaters; vary the season for protecting wild birds; enforce orders of the Privy Council as to contagious diseases of animals or insects; license factories and magazines of explosives; regulate fishery districts; provide and manage asylums,

reformatory and industrial schools; decide compensation for damage from riots; verify weights, measures, and regulate gas-meters, etc.

Certain counties possess special powers. (For London, see LONDON COUNTY COUNCIL.) All persons registered as local government voters, all persons entitled to be so registered except as to residence, but who live within 15 miles of the county, and are rated to the poor at £30 per annum, or possess £1000 of property, and all persons owning property can be county councilors. Electors must own or occupy land or tenement worth £10 per year, must have resided there six months, have paid all rates and taxes; or if he has paid all rates and taxes, and have resided there 12 months, he may vote, tho the building he occupy be not worth £10. The aldermen are elected by the council, and compose one third of the number of councilors. County councilors hold office three years, and retire together. Aldermen hold office six years; one half retire every third year. The revenue of the council is two fifths of the probate duty, the local taxation licenses, the county rates, which in 1886-87 amounted to £130,000,000 for England and Wales, varying from 15*d.* in Lancaster to 6*d.* in Montgomery. Councils can borrow for periods not exceeding 30 years. (See also LONDON COUNTY COUNCIL.)

COURCELLE-SENEUIL, JEAN GUSTAVE, was born at Dordogne, Chile, December 22, 1813. He was at first a merchant, but later occupied himself with the study of economics. In 1848 he held for a short time a post under the Minister of Finance; from 1853-63 he was Professor of Political Economy at the University of Santiago, in Chile. Since 1879 he has been State Councillor; since 1882 Fellow of the Academy of Naval and Political Science. His best-known works are *Études sur la science sociale* (1862); *Opération de Banque* (1853); *Traité théorique et pratique d'Economie politique* (1867), one of the best-known treatises on the subject in the French language.

COURTS. See JUDICIARY.

COXEY, JACOB SELCHER, AND "COXEYISM."—The movement popularly called "Coxeyism," or the formation of "armies" or companies of unemployed men or of those sympathizing with them to peaceably march to Washington, and give Congress and the country visible evidence of the distress of the unemployed, and thus induce legislation to meet the need, is a movement which has gained its name from Mr. J. S. Coxey, of Ohio, to an extent the originator of the movement, and the "general" of the leading "army;" but it seems to be a movement that sprang up sporadically at the same time in various parts of the country out of the distress and lack of employment in the hard times of 1894. (For an account of these times, see CRISIS: UNEMPLOYMENT.)

Jacob Selcher Coxey was born in Pennsylvania in 1854, and after leaving school when he was 13 worked for 10 years in a rolling-mill, leaving this to enter business on his own account. In 1879 he purchased a sandstone quarry at Masillon, O., where he has since lived, and in 1889 he added to other ventures a stock farm in Kentucky, making a specialty of blooded racing horses. He prospered, and is reputed by his neighbors to be worth some \$200,000, an honest and successful business man. Originally an Episcopalian, he has become a theosophist, and is said to have believed that he and his lieutenant, Browne, are between them sharers of the reincarnation of Christ.

Long interested in public questions, in 1892 he drafted a bill, which was presented in Congress, calling upon the Federal Government to construct a general county road system in the United States, and to meet the expense of this by issuing \$500,000,000 of treasury notes to be a legal tender for all debts. The bill, however, was pigeonholed by Congress, and this led Mr. Coxey to more radical agitation. There now appeared on the scene a Mr. Carl Browne.

Mr. Carl Browne was born near Springfield, Ill., in 1849. He became a painter, and painted a "Lord's Supper" and panoramas of the Yomsemite, of the Franco-Prussian War, and other subjects, which were exhibited all over the United States. In 1872 he married and settled in Berkeley, Cal. At the time of the great Pennsylvania strikes of 1877 (see STRIKES) he came out for the cause of Labor, and later supported Dennis Kearney's agitation by cartoons and in a newspaper. He then threw himself into the Greenback and later the Populist movements. Christmas Day, 1892, his wife died of pneumonia, and it was during her last days that he was converted to theosophy, believing that he absorbed his wife's soul. He went to the World's Fair at Chicago in 1893 and met Mr. Coxey at a bimetallic convention. He later visited Mr. Coxey, and was sent by him to Chicago to induce the American Federation of Labor to endorse the Good Roads plan. He succeeded, and there devised the plan of marching the unemployed to Washington. Mr. Coxey approved the plan. They finally decided to start, and did start from Masillon,

Coxey's Army. Easter morning, March 24, 1894. They planned to reach Washington on May 1, to present a petition to Congress on the steps of the Capitol, and then to camp there until Congress acted upon two bills to be presented by Senator Peffer (*q.v.*)—a Good Roads bill and a Non-interest Bearing Bond bill.

As Mr. Coxey was very busy, tho he accompanied the army, with his wife, daughter, and a little infant son, whom he named "Legal Tender," he left the whole management of the army to Mr. Browne. The plan was to get an army of 100,000; as a matter of fact, they never had over 500. It was a motley, altho perfectly orderly company. It took a religious coloring. They called the army "The Commonweal of Christ" and bore a banner with a portrait of Christ, and the legend "Death to interest-bearing bonds." As they left Masillon, a negro carrying the American flag marched ahead. Then on a gray horse rode Carl Browne, in the dress of a cowboy, with buckskin coat, fringed down the sleeves and plastered with decorations, a broad-brimmed sombrero on his head, around his neck an amber necklace given him by his wife. Next came the trumpeter, "Windy Oliver," the astrologer, "Cyclone" Kirkland, of Pittsburg, and seven musicians. "General" Coxey came next in a buggy drawn by two bay mares. Behind rode Mrs. Coxey with her infant child and her sister. Then came another negro carrying the banner of the Commonweal; next the army proper of 100 men, expected to swell on its way to Washington to 100,000, and accompanied on either side by 43 newspaper men. Three wagons carried a circus tent and supplies. As a rule,

the army was supplied, however, with victuals by people on the way, but went often hungry. Crowds gathered to see them at every point. On Sundays Browne preached, with continual allusion to Scripture prophecies. They met many difficulties, such as a snow-storm in crossing the Blue Mountains. Some of their men were arrested as vagrants. Dissension arose, but they persevered. After reaching the Chesapeake and Ohio Canal they were transported for 90 miles. Everywhere they preserved good order. Mr. Coxey boasted that not a chicken had been stolen on their march.

Meanwhile, the idea had set other "industrial armies" marching. Much larger than Coxey's army was an army numbering at one time 2000, raised by Mr. C. T. Kelly, in San Francisco, which started April 3. Another army from the Pacific coast started from Los Angeles, under "General" Lewis S. Frye. They numbered at first 700 men, and later 1000. The Pacific armies said little about good roads, but wanted the irrigation of the desert. They sometimes induced the railway companies to carry them. Frequently they seized freight trains. This brought them several times into contact with the police, and they found themselves confronted with Gatling guns. But almost everywhere they were supported, aided, and sometimes *flêted* by the people.

Still other armies were organized. Dr. J. H. Randall raised an army of 1000 in Chicago. "General" Hogan formed an army of 500 in Montana. There were other smaller movements. "General" Fitzgerald led an army of 60 from Boston, organized out of an agitation in that city led by Morrison I. Swift. A larger company joined this army in Connecticut. C. C. Jones organized an army of 100 or 200 in Pennsylvania. The West, however, furnished the most men. A second army under "General" Vinette was organized in Los Angeles. It finally numbered 950 men. Other companies were organized in Oklahoma, Nevada, Colorado, Missouri, and there were temporary movements in other States.

Meanwhile, the "Commonwealers" reached Washington the last of April. May 1, in a solemn procession, the army marched to the Capitol to present its petition. Thousands flocked to see the sight. But when Mr. Coxey alighted he is said to have walked on the grass, and he, Carl Browne, and Mr. Jones were arrested "for trespassing on the grass." Mr. Coxey handed his address to the reporters, and was hurried away by the police. The army quietly returned to its camp. Coxey, Browne, and Jones were imprisoned 20 days. When they came out the movement was practically at an end. The army was maintained for awhile, but gradually disbanded. Congress had been somewhat frightened, and considerable talk and discussion arose as to conditions that led to such armies; but no serious action was taken. "General" Coxey himself, however, has entered politics more earnestly than ever, and in 1895 was nominated for governor by the People's Party of Ohio, and polled 52,675 votes, the Populist vote for President in Ohio in 1892 being only 14,850.

The Result.

The other armies continued for awhile after May 1. "General" Kelly's army got as far east as Iowa. They were mainly transported by the railroads and assisted by citizens and sometimes by the mayors. It was thought a good thing to help these unemployed men east, where it was expected they would find work. At Council Bluffs, the railroads refusing transportation, some of the army captured a train from the transfer yards. The Governor considered calling out the militia, but "General" Kelly decided to return the train. Mayor Bemis, of Omaha, promised 1500 lbs. of meat, 2000 loaves of bread, 2000 lbs. of coffee, and the army quietly marched on. The army organized by "General" Hogan in Montana had a more serious time. It captured a Northern Pacific train at Butte City. As the road was in the hands of the United States Court, it was directly under federal jurisdiction, and orders were at once issued by Judge Caldwell for United States deputies to capture the train. They attempted this at Billings, and the citizens, siding with the "industrials," the deputies fired on the "mob." One citizen was fatally shot and others wounded. This enraged the people, and they helped the "industrials" to escape. At Forsyth, however, the flying train was finally captured, and the "army" surrendered.

Such were the main incidents. Gradually the movement came to an end. Returning opportunities for work absorbed most of the men and the rest disbanded. With its *bizarre* side the movement had its serious side, at least as an evidence of the lack of employment among large bodies of law-abiding citizens. The men of these armies were not tramps or law-breakers. They simply asked for work. Of 290 "industrials" selected at random from "General" Randall's Chicago army, Professor Hourwich, of the University of Chicago, says: "One half were American born, two thirds were English-speaking men; they averaged from 30 to 32 in age; 181 were skilled mechanics; of 115 questioned only 2 were uneducated; 26 had attended high school or college; only 5 or 6 appeared of questionable character; 70 were trade-unionists." Carlyle said of a similar Manchester "insurrection in England:" "An insurrection that can announce the disease and then retire with no balance account of grim vengeance opened anywhere has attained the highest success possible for it."

CRAFT GUILDS. See GUILDS.

CRANE, WALTER, was born in Liverpool in 1845; the son of Thomas Crane, a miniature and portrait painter. Apprenticed in 1859 to W. J. Linton, the eminent wood-engraver, poet, and chartist, Walter Crane learned from him reform ideas, as well as lessons in art. A prominent member of various art societies and committees, an examiner at the national competition of drawings at South Kensington since 1879, elected an associate of the Royal Society of Painters in Water Colors in 1888, he was associated with the movement against the Royal Academy

in 1886, and favored the establishment of a national exhibition in which *all* arts should be represented. In 1888 he founded with other decorative artists the Arts and Crafts Exhibition Society, and became its first president. Successful as a painter, he is even better known as a designer and decorator of books, etc. In 1891 an exhibition of his works was held, and the collection was also taken to the United States and Germany, Mr. Crane accompanying it. In 1884 he became associated with the socialist movement, largely under the influence of William Morris (*q.v.*), and has lectured and written for it, besides making numerous designs for socialist books and papers. In 1892 he was appointed director of the Manchester Municipal School of Art.

CREAMERIES. See COOPERATIVE DAIRIES.

CREDIT is a term used in political economy in so many different ways and in so many shades of meaning that it is almost impossible to define it so as to cover all its uses. Certainly many of the definitions given to it by economists are faulty. Credit is defined by John Stuart Mill as "permission to use the capital of another person." Professor Roscher defines it as "the power to use the goods of another, voluntarily granted in consideration of the mere promise of value in return." Credit has also been defined as "confidence in the ability of another to make a future payment."

Professor Knies, of Heidelberg, has defined credit as merely "a commercial transaction between two parties, in which the services or the value rendered by the one falls in the present, and the counter service or counter value of the other in the future."

Says Professor Ely: "There are three elements in a business transaction to which we apply the term credit: first, the present transfer of goods; second, the use of the goods transferred; third, the future retransfer of the goods or an equivalent—that is, repayment."

But these definitions, while emphasizing important points, do not cover all the uses of the word, nor give even its central idea. Professor Jevons does better, in his *Primer of Political Economy*, in reminding us that credit comes from the Latin *credo*, and means *belief*. Any one who sells on credit does so in the belief that the purchaser who does not pay at the time will do so in the future. Credit is trust. A man, a government, or a currency that has good credit is trustworthy. As such, credit enters into all life. It has been said that there is scarcely a human being in a civilized country who does not transact a piece of credit business almost every day of his life. The workman hired by the week, and paid at its end, gives his employer credit from Monday morning to Saturday evening. The same workman, when getting a coat made for himself, even altho he engaged to pay ready money on delivery, gets credit from the tailor during the making.

Into monetary transactions of a more ambitious nature credit enters still more largely, and in many forms credit is the instrument for the greater number of exchanges. Money is used, but, in the latest development of credit econ-

omy, only as "small change." Banks are the chief organs of society for credit economy. We live now in a period of credit, and in business circles the volume of money is small when compared with the amount of annual transactions in what are called instruments of credit, by which we mean principally checks, drafts, and bills of exchange. An American bank in a large city will in a day's business frequently handle over \$40 in instruments of credit for every dollar in actual money. According to Rae, from 70 to 90 per cent. of the monetary transactions of the world are done on a credit basis. Nevertheless, there is serious doubt if this is not an exaggeration. President Andrews, in *An Honest Dollar*, gives elaborate reasons for questioning whether the proportion is so large as is generally supposed. He shows that clearings for many years have fallen in numbers in this country and in England; that never since 1882 has the New York Clearing House cleared in an autumn week a sum reaching the billion figures, which was a regular thing that year. Some credit substitutes for cash have been disappearing. The truck system is dying out. Barter in rural communities is disappearing. Book accounts between neighbors, once common, are now rare. "With nations, as with individuals," says President Andrews, "those who have the most credit need use it the least." Credit traffic has its fullest development in Holland; its strongest in Turkey and Yucatan. Cash payment getting the mastery, first in wages, in retail trade, and in raw products, spread gradually over other fields, shutting up credit to its most useful and least dangerous functions. Many authorities agree with President Andrews, others do not. (For the economic principles involved in and growing out of credit, see MONEY; CONTRACTION AND EXPANSION OF CURRENCY; PANICS, etc.)

CREDIT CYCLES. See CRISES.

CREDIT FONCIER (credit based on land, from *fond*, bottom or ground) is the name of a large society established in France in 1852 on the plan of borrowing money by mortgaging land (for a sum not exceeding half its value), and repaying the borrowed money with interest in small and regular instalments. Down to the beginning of 1892, the Credit Foncier had loaned \$28,800,932.

CREDIT MOBILIER (credit on movable or personal property) is the name of a large joint-stock company in France, sanctioned by the Government in 1852, with a capital of \$12,000,000. Its object was (1) to initiate trading enterprises of all kinds on the principle of limited liability; (2) to supersede or buy up trading companies—*e.g.*, railway companies, and to issue scrip and shares of its own for the shares and bonds of the company; (3) to carry on banking business on the principle of limited liability. It commanded at first great success, and planned to extend itself all over Europe and issue obligations to the amount of \$48,000,000. This was forbidden by Government, and the stock at once fell. Since then its dividends have greatly varied, till its affairs were wound up in 1868.

CREDIT MOBILIER, IN UNITED STATES HISTORY.—The Credit Mobilier was the name of a corporation to deal in railway stocks, around which has gathered one of the most extensive scandals in the history of this country, tho some believe that many of the names connected with it have been treated with gross injustice. It is inextricably bound up with the history of the building of the Pacific Railroad, and, therefore, we must begin with this.

In 1863 there was talk of a railroad ultimately to reach across the continent, and Congress was induced to pass an act incorporating a company for the purpose of building a railroad and telegraph between a point in the territory of Nebraska, on the 100th meridian, and a point on the western boundary of Nevada. The capital authorized by the act was \$100,000,000. The company was granted a right of way 200 feet wide through the public lands, a right to take grounds for stations and other necessary buildings; and the right also to take from any adjacent public lands earth, stone, timber, and other materials for construction. Beside this a grant of land was made of alternate sections along the whole line, 20 miles wide. The act also authorized the company, on the completion and equipment of 40 consecutive miles, to call upon the Secretary of the Treasury for United States 6 per cent. bonds, at the rate of \$16,000 a mile, this loan to be a first mortgage on the whole line and equipment. For 300 miles of the road, however (the most mountainous and difficult part), the loan was to be \$48,000 per mile, to be issued as each 20 miles was completed. On still another part the loan was to be at the rate of \$32,000 a mile. This was the act incorporating "the Union Pacific Railroad Company." Under this charter, however, nothing was done for a long time; \$100,000,000 of capital are always difficult to raise, particularly in the midst of a great civil war; and besides this, the capital under the act was to be *loaned* paid-up stock—for every certificate issued by the company the company must have received its full value in lawful money of the United States. In this condition affairs remained for two years, when it occurred to some ingenious and hopeful men that the act might perhaps be modified so as to make the enterprise a less difficult one. They accordingly applied to Congress and obtained what they asked. There was about this time a very general feeling of interest in the enterprise: "it was felt by the people that we ought to have a railroad connecting the Atlantic with the Pacific, a great national highway, bringing the products of China and Japan—their silks and teas and their labor—to our very doors." The newspapers were in favor of it. Mr. Lincoln himself gave it his warm support. The legislation applied for was granted with a sort of enthusiasm. This time the company received for a land grant, instead of 5 alternate sections per mile, 10; the grant was made 40 miles wide instead of 20; provisions in the former act in favor of the Government were repealed, and the road was empowered to issue first mortgage bonds for an amount equal to the United States loan whenever they had completed 20 miles of road. This act made the United States loan a second instead of a first mortgage. In return for all this, it was provided that the Government directors should be five in number, instead of two. The land grant by this new act was equivalent to 12,800 acres, or 20 square miles for every mile of road.

Still little or nothing was done. Half a million only was subscribed till (in 1865) Mr. Ames decided to take the road on his own shoulders. He did so, and thought he saw a way out of the difficulty. While he could not build the road under the provisions of that bill, it was possible, he thought, to do it "by a contracting company, to which parties owning stock could subscribe a limited amount and be in no danger of losing any more than they subscribed."

There was at this time in existence a charter granted in Pennsylvania in 1850, to a fiscal agency, to negotiate loans for railroads, and take construction contracts. Its name had been changed to the Credit Mobilier of America, but its stock was now almost worthless, and the liabilities of its stockholders very limited; and it occurred to Mr. Ames that he would buy it out for a few thousands, and let the Credit Mobilier build the road. Mr. George Francis Train seems to have been the presiding genius of the old agency, and he was approached, and the Credit Mobilier changed hands.

We are now ready to understand the construction of the Union Pacific Railroad. First, 238 miles were built by the Union Pacific Railroad at a cost of \$27-

000 per mile, and then contracts were made with Oakes Ames, H. M. Hoxie, and one Davis to complete the rest. No one of these really did anything but turn their contracts over to the Credit Mobilier Company. Mr. Hoxie at the time he took his contract was simply running a local ferryboat. The Credit Mobilier Company contracted to build the first 100 miles for \$42,000 a mile; the second 100 for \$45,000 a mile; the third 100 for \$56,000 a mile; the fourth for \$80,000 a mile; the fifth for \$99,000 a mile, and the sixth for \$96,000 a mile. This was made to apply to the 238 miles already constructed, less the actual cost, so that for the first 200 miles the Credit Mobilier, without doing a stroke of work, cleared a profit of some millions on that portion alone for work they did not do. The profit on the entire road above all expenses was estimated by a Congressional committee at at least \$43,925,328.34.

Credit Mobilier shares naturally were valuable. Oakes Ames, at that time a member of Congress, in December, 1867, entered into contracts with various members of the House of Representatives to sell to them stock of the Credit Mobilier at par, merely stating that it was a good investment, and in some cases, in answer to a direct question, asserting that no embarrassment to them could flow from it, as the Union Pacific had received all the aid that it wanted from the Government. Some of the members that thus bought stock paid for it; for others Ames advanced the money, agreeing to apply the dividends of the stock to the payment of the indebtedness. Two dividends received in 1868 sufficed to pay for the entire stock of the latter class of members and left a small balance due to them. Among these members was James A. Garfield, of Ohio, and in the Presidential campaign of 1880 his connection with this matter was brought up against him. Charges based on the affair had also been circulated during the campaign of 1872, and on the assembling of Congress a committee of investigation was ordered by the House on the motion of the Speaker, James G. Blaine. The committee was appointed by a Democrat temporarily acting as Speaker, and consisted of two Democrats, two Republicans, and one Liberal Republican. The committee recommended the expulsion of Oakes Ames, of Massachusetts, and of James Brooks, of New York, the former for having attempted to bribe members by sales of stock below its value, the latter for having received stock from the Credit Mobilier much below its value, knowing that it was intended to influence his action. They were not expelled, but were subjected to "the absolute condemnation of the House." The committee further found that the national appropriation had been "distributed in dividends among the corporators; that the stock had been issued, not to men who paid for it at par in money, but who paid for it not more than 20 cents on the dollar in roadmaking; that of the Government directors, some of them have neglected their duties and others have been interested in transactions by which the provisions of the organic law have been evaded; that at least one of the commissioners appointed by the President has been directly bribed to betray his trust by the gift of \$25,000" (*Report of the Wilson Committee*, p. iii.-iv.).

It is claimed, however, by many that it was not proven that Mr. Ames had induced Congressmen to take the stock for any corrupt purpose, since he claimed that the Union Pacific had nothing more to gain from Congress. Able lawyers and capable business men assert that if there was some dishonesty and peculiar bookkeeping, Mr. Ames and other leading members were not responsible, but simply made some shrewd contracts and a large venture when capital was slow, and reaped unexpectedly large profits by perfectly legitimate means.

CREMATION.—Cremation, or, as it is sometimes called, incineration, is the rapid decomposition of human bodies by means of extreme heat. All decomposition or disintegration is, of course, effected through the agency of heat, and the length of time which is occupied in the process depends upon the degree of heat that is employed. If the heat be reduced to the point at which water freezes, decomposition ceases, or proceeds so slowly as to be imperceptible. When bodies are placed within the ground, so

that no more heat than that which is naturally contained in the earth can act upon them, decomposition goes on perceptibly, but still very slowly. During its progress new compounds are formed, and some of these find their way into the air as fetid and noxious gases, while others, in a liquid form, contaminate the water which has its origin in the neighborhood.

To such an extent is this accomplished, that high medical and chemical authorities have pronounced the opinion that organic substance can never undergo what may be called spontaneous decomposition without so contaminating the adjacent air and water as to impair the health of those living in the neighborhood, and to shorten the average duration of life. The rapidity with which these noxious emanations are liberated is in direct ratio to the temperature up to a certain point. Beyond this point the probability of producing these secondary compounds is diminished as the heat is increased; until, at length, with the high degree which is generated in a modern cremation furnace, their formation is reduced to an impossibility. After their segregation the constituents of the body are driven off so rapidly that no time is permitted for recombinations before they have been received in a second superheated chamber, where their capacity for harm is destroyed and their affinities neutralized or changed. As elements they are expelled into the outer air and there absorbed and assimilated by those forms of life of which they are the natural sustenance and nourishment.

The process of disintegration, or resolution into elements, is thus seen to be the same, whatever may be the method employed to encompass the result. The discovery and employment of the best method of effecting this object, in the case of human bodies, is one of the most momentous questions that can engage the attention of man. It is believed by many that a large proportion of the diseases which afflict mankind are due to the slow decomposition of organic matter within or upon the earth. The vast aggregations of humanity in the large cities of the Old World, and the tendency to the same topical accumulation in the New, give the matter to-day an importance greater than it ever had before. "Cemeteries," as was once said by an English prelate, "have become not only a difficulty, an expense, and an inconvenience, but an actual danger." When thousands of bodies are interred yearly in a limited area, the earth becomes in time so saturated with the liquid resultants of decomposition, that it is incapable of further absorption. Then, whatever be the character of the soil, the decomposition becomes still less rapid, and its gaseous products find their way directly into the air. To the power of escape which these gases possess there appears to be practically no limit. They are said to have been detected arising from organic matter within the earth at a distance of ten feet from the surface.

But it is not in modern times only that circumstances have compelled a consideration and discussion of the means by which the human body can be best disposed of after death. In Rome both inhumation and cremation were employed, and either was expressly permitted by the Roman law. It was found, however, that accumulations of decomposing bodies within the

boundaries of the cities was not favorable to the health of the community, and cemeteries were removed to the rural districts. Cicero tells us that by one of the twelve tables it was decreed that *hominem mortuum in urbe ne sepelito neve urito*. From the foundation of the empire to about the fifth century of the Christian era burial in the earth was almost entirely abandoned, and cremation substituted.

When the burning of the dead was first adopted by the Greeks it was not settled. By many its inception is thought to have had no connection whatever with sanitary considerations, but that it was put into practice during the Trojan war, so that the remains of the slain chieftains might be the more easily conveyed back to their native land. This, however, is doubtful. Homer certainly does not mention it as an innovation, but speaks of it as if it were a common custom. It is tolerably certain, nevertheless, that it was not employed on sanitary grounds; for when it became the established custom, the rite was denied to those who committed suicide, to children who died before having cut their teeth, and to those who were killed by lightning.

Greeks, Romans and Jews.

Among the ancient Jews, also, both methods appear to have been in use; and, strange as it may seem among a people whose customs were almost generally based upon sanitary considerations, the health of the living had no manifest association with the disposal of the dead. The burning of the body was ostensibly regarded as the more honorable manner, and the ceremony was performed as a mark of respect to the memory of the deceased; while it was explicitly denied to those whose lives were regarded as having reflected discredit upon the nation.

Among these nations, and by the Hindus at the present time, as well as with the native Australian, the American Indian, and other savage tribes, the means by which cremation was effected was the open pyre, consisting generally of a platform of rough logs, upon the top of which were placed both the body and the bier upon which it had been brought. The flames were fed with oil, and perfumes were plentifully supplied for the purpose of counteracting the odors that arose from the burning body. So conducted, it was to the health of the survivors a menace worse than interment in the earth, and there can be no regret felt that the Christians abolished the custom.

This they did so thoroughly that, for a period of 1500 years, we do not know of any cremation having taken place in Europe. From the end of the fourth century of the Christian era until the year 1658, we do not find the subject even mentioned in European literature. The essay of Sir Thomas Browne upon non-burial was then published, and caused a temporary interest in the subject. This soon died out; and, with the exception of a work from the pen of Scipio Piattoli, published in 1774, we hear no more of the matter until the period of the French Revolution, when an investigation was ordered and made, without being followed by a practical result.

In 1817 Dr. Jamieson published in the Proceedings of the Royal Society, Edinburgh, a paper on *The Origin of Cremation*, and in 1822 public attention was directed, in a forcible manner, to the merits of the question. In July of that year the poet Shelley and his companion Williams were drowned by the upsetting of a boat in the Ligurian sea. Their bodies were washed ashore near the Lighthouse. The quarantine laws of Tuscany required the burning of all material drifting in from the sea. Byron and Shelley had made an agreement that whichever died first should be cremated by the survivor. Thus, by a singular coincidence, was Byron compelled by legal enactment to perform on the body of his friend a ceremony which had been prearranged, but in the conduct of which he had expected to meet with powerful opposition.

This burning of the body of Shelley upon the Italian shore of the Mediterranean was very fully described by Trelawney, who was a witness of the ceremony. It attracted a great amount of notice and comment. Discussions concerning the relative merits of inhumation and incineration were started, and conducted with earnestness and ability. For the first time in its history, Science bestowed its attention upon the subject. It pronounced so emphatically its opinion that injury was done to the living by the accepted method of burying the dead, that public attention was more or less focussed upon the sanitary aspect of the question, and the way was prepared for the permanent literature and the practical efforts which were put forth a few years later, and have continued to make their ap-

pearance, with but short intermissions, until the present time.

Also the first step toward a practical realization of the desires of those who believed that good would result from the substitution of cremation for earth burials was made in England, yet for more than one reason must Italy be regarded as the pioneer in Europe of the modern scientific system of reducing to a minimum the time required for the disintegration of the human body. It was chiefly through the efforts of Drs. Pini and Cristofolini that the first Italian cremation society was formed. This was done in 1876, in the city of Milan. In 1877 incineration, as a substitute for inhumation, was endorsed by a medical congress which met in that city. In this year also two other societies, those of Cremona and Lodi, were formed, and Rome and Udine followed suit in 1879. Several others have since been established, and to-day Italy stands first in Europe as regards the number of its societies, as well as of appliances for putting cremation into operation. This result is, no doubt, greatly due to the fact that the church does not in that country appear to oppose the system, as its clergy do in almost every other land.

Modern Times.

In Prussia, altho the subject has been much agitated, and notwithstanding the fact that Berlin possesses one of the largest cremation societies in the world, the state of the law has, so far, acted as a veto upon all attempts at practical application. In other parts of the German Empire crematories have, however, been constructed. The first of these was in Dresden, but this turned out a premature attempt on the part of the Saxons to change a prevailing custom; for after two incinerations had taken place further operations of the kind were forbidden. Gotha remained for several years the only place in Germany where cremation could be carried into effect; but appliances for that purpose now exist at one or two other places, such as Hamburg and Heidelberg.

In 1874 the first attempt to carry the change into England was made by the formation of the Cremation Society of England. For several years the parliament of the country was asked to take such action as should legalize cremation. At length the body of a child was cremated, and the father was prosecuted upon the charge of having performed an illegal act. At the trial, however, the presiding judge laid down the rule, that, provided it was done without creating a nuisance, there was, in the law, nothing which was infringed by this method of disposing of a body. At this, the crematorium of the society was at once opened and has since continued in operation. The action of this society aroused an interest in the subject in other parts of England, and in the latter part of 1888 a society was formed in Manchester, where a crematory has since been erected, and is now in operation.

In Switzerland Zurich led the way in 1873, and since then incinerators have been constructed in that city and in Geneva. France cremates her dead in considerable numbers, and Sweden has manifested great activity in the matter, crematories being in operation in Stockholm and Gottenburg. In Portugal has been passed a law which many, who have bestowed time and thought upon the subject, think should be in force in every civilized community. The cremation of those who die of contagious diseases is made obligatory. In Denmark, Holland, Belgium, Russia, and Austria great interest has been manifested in the subject, and there are clear indications that here long some, if not all, of these countries will possess the means of incinerating their dead. The number of cremated bodies is undoubtedly still quite small when a comparison is made with the number of persons who die each year; yet, when consideration is had to the shortness of the time in which the matter has occupied public attention in what may be termed a serious manner, and scientifically constructed apparatus has been employed, it must be said that the progress which has been made is such as cannot fail to be satisfactory to the advocates and promoters of the innovation.

This remark applies with equal force to the United States. The first effort to form a cremation society in this country was made in 1874 in the city of New York. The financial stress of the time was such, however, that it was found impossible to raise the money which was regarded as necessary to launch properly an enterprise which was then in such strong opposition to general sentiment. The project died, and for seven years the subject lay in quiescence. In 1881, two societies were formed: the New York Cremation Society, to prepare public opinion for a recep-

tion of the theory, and the United States Cremation Company to construct the machinery necessary for putting that theory into practice.

The United States.

While this agitation was going on and the stock of the cremation company was being disposed of, Dr. F. Julius Le Moyné, of Washington, Pennsylvania, put up a small building with a furnace intended for the cremation of his own body. In the mean time other bodies were received and incinerated in order to familiarize the public mind with this method of disposing of the dead. Thirty-eight bodies were reduced to ashes in this building, the last of which was done in September, 1884.

Early in 1884, the Cremation and Funeral Reform Society, of Lancaster, Pa., was organized, and in November of the same year the crematory, which it had built, was completed and opened to the public. In 1885, the United States Cremation Company, which had met with serious drawbacks in the prosecution of its work, got its apparatus into working order and conducted its first cremation. During the same year a society was formed in Buffalo, N. Y., and a fine building erected. This incinerated its first body in the following December.

Besides those named, four societies were formed in 1885. The Michigan Cremation Society was formed at Detroit, but it was not until nearly two years later that its crematory was brought into use. The Baltimore Cremation Company found difficulty in the pursuit of its plans, and it was not until nearly five years afterward that its apparatus was complete and the first incineration took place. The San Francisco Cremation Company was still more unfortunate, and it was not until quite recently that it was in a position to carry out its objects; while at Davenport, Ia., the crematory of the Northwestern Cremation Society, organized in the same year, opened its building to the public in the year 1891.

The Cincinnati Cremation Company was organized in 1884, but, like many others, had to overcome obstacles in the furtherance of its designs, and it was not until two years later that it was in a position to receive its first body for cremation. In 1886 the Philadelphia Cremation Society first saw the light, and as soon afterward as its building could be erected it was dedicated to the service of the public. The board of health of that city has also stationed a crematory adjacent to the municipal hospital, for the purpose of disposing of the pauper dead and those who have died of contagious diseases in the hospital.

In Pittsburg is located a crematory in which, it is said, more bodies of prominent Americans have been reduced to ashes than in any other in the country. The furnace is situated in an undertaking establishment, and among the bodies cremated here may be mentioned those of Emma Abbott, Major McKee, commander of the Allegheny Arsenal, and Professor Arbogast, a local musician of considerable note. This crematory is peculiar in being the only one in the world situated on a busy street in the heart of a great city, and likewise the only one that has the advantage of natural gas for fuel. It is noted particularly from this fact, and in foreign journals is always spoken of as the "natural-gas crematory." About seven or eight hours are required to heat the furnace to the proper temperature. Within one hour or one hour and fifteen minutes after a body is introduced, nothing remains but the ashes. Not more than a few feet from the crematory is an apartment intended as a receiving vault as well as for the temporary reception of urns.

More than a passing remark must be given to the crematorium at Troy, N. Y. This building is, perhaps, the most beautiful, as it certainly is the most costly structure of the kind in the United States. It stands in Oakwood Cemetery, on the edge of a cliff 300 feet high, overlooking the Catskill Mountains and the waters of the Hudson. It was erected by Mr. and Mrs. William S. Earl, of Troy, as a memorial to their only son, who died March 3, 1887, after having become, while traveling in Europe, so favorably impressed with cremation as there conducted, that he had desired his own body, at death, to be subjected to the same process. This was done at Buffalo on April 20 of the same year. The memorial is a magnificent granite structure, 136 feet in length and 70 feet wide, with a tower 90 feet high. It has been made a gift to the crematory company with the reservations that a place of burial shall be provided within for the members of the Earl family; that there shall be a uniform charge for cremation to all applicants; and that the chapel shall be free for funeral services to all owners of lots in the cemetery. The edifice contains two fur-

naces, placed beneath the room in which the retorts are situated; and, by a combination of gases, which enter the retort at different points, an intense heat can be engendered with the consumption of a comparatively small quantity of fuel.

A few words must also be said about Waterville, N. Y. In the cemetery of this village has been erected a very pretty little Gothic structure, which has been presented to the crematory company by Mr. William Osborne, one of its directors. The building was finished in the autumn of 1891, and contains a furnace 7 by 11 feet, constructed of fire-brick. The sarcophagus in which the body is incinerated is 10 feet long, 3 feet wide, and 2 feet high, in which it is said to be possible to obtain a temperature of 2000 degrees Fahrenheit. The erection of this crematorium in a village cemetery, and the formation of cremation societies among the trades-associations of the country, mark a distinct epoch in the history of the subject. They show that the seed is taking root in difficult ground, and permit the indulgence of the hope that progress will be continuous until this system of returning our bodies to the dust of which they are formed will become the prevailing custom in civilized communities.

The history of the movement in New England is well worth a few words of notice. It was not until the year 1883 that any attempt was made to introduce cremation into this part of the United States, and not until November, 1885, that the endeavor was successful. The delay was occasioned by the fact that such a society could not be formed in Massachusetts without the passing by the Legislature of a special act authorizing the proceeding. After the society was organized it was found impossible to raise the necessary funds for carrying out its purposes. At the expiration of three years, the attempt was abandoned.

This was in Boston. In Worcester a like endeavor met with a similar fate; but while in the former instance the society itself was dissolved, in the latter case it was allowed to continue in existence.

In the latter part of 1890, the matter was again brought before the public in Boston. Even then it was found impracticable to launch the enterprise with reasonable hope of obtaining the necessary subscriptions. An "educational society" was, therefore, formed, and the work of disseminating information upon the subject was inaugurated. Early in 1892 proposals were made to the Worcester corporation to allow the re-organization of their society in Boston.

The plan was agreed to, and the change was carried into effect. The advance in general opinion was such that the stock of the newly constructed organization was disposed of with comparative alacrity, and by the end of 1893 the Massachusetts Cremation Society was able to announce that it was prepared to receive bodies for incineration.

Thus it will be seen that, altho the first of the existing operative crematories in the United States of America was not in operation until the year 1885, yet at the end of 1893, a period of somewhat more than eight years, there were, in this country, at least 15 of these appliances for the rapid disintegration of the human body. Of these, New York possessed four, at New York City, Buffalo, Troy, and Waterville; Pennsylvania, four, at Philadelphia (two), Lancaster, and Pittsburg; California two, at San Francisco and Los Angeles; and the following States one each: Missouri, at St. Louis; Ohio, at Cincinnati; Michigan, at Detroit; Maryland, at Baltimore; Iowa, at Davenport; Illinois, at Chicago, and Massachusetts, at Boston. In addition to these there is one at Washington, Pa., of which mention has been made; and one was erected at San Antonio, Tex., but was destroyed by fire in 1891, and has not yet been rebuilt.

The furnaces used in Europe are principally those invented by Siemens, Brunetti, Gorini, and Venini. The latter system is also in use at Buffalo and Troy, N. Y. In the basement of the building is a gas generator, through the bottom of which is admitted a quantity of air not sufficient to allow of the combustion of the entire quantity of fuel, which is wood. The top portion of the wood is thus distilled while the lower is burning. The gases arising from these two processes are carried to the sarcophagus, as the incinerating chamber has been aptly named, where they are met by a volume of heated air, and ignited by a fire just under their point of union. This produces a Bunsen flame of intense heat, which, coming into contact with the body, soon releases the liquid and gaseous components, which are carried off into a flue, where another Bunsen flame receives them and despatches

Later Developments in this Country.

them to the chimney, where a third Bunsen burner makes a thorough combustion certain, should the smallest amount of deleterious product have by any possibility escaped from the two furnaces through which they had already passed.

In the San Francisco building has been placed a furnace which is the invention of Richard Schneider, of Dresden. The result is here also achieved by a sort of Bunsen combination of air and gas; but in this coke is used instead of wood. The greatest number of crematoriums in the United States are supplied with apparatus contrived by Dr. M. L. Davis, of Lancaster, Pa. By his system the flame created by the fuel does not come into contact with the body to be cremated. The sarcophagus is directly over the furnace; its bottom is solid, while the sides and ends are pierced with holes, by means of which the heated air of the furnace has free access to the subject, while the flames are not allowed to enter the chamber which contains it. All the volatile emanations from the body are conducted through another highly heated chamber, where they are rendered odorless and harmless before they find their way into the chimney.

The method employed at Boston is also the production of an American inventor. The principle of the Bunsen burner is here again brought into use. The fuel employed is petroleum, and the gas from this is, at its entrance to the sarcophagus, met with a current of air, forced in by means of a steam fan, and then ignited. The flue by which the gaseous products of the combustion are carried off is heated by another aerated gas flame of equal intensity, and nothing that can be made sensible to either the eye or the nose is allowed to issue from the chimney.

Among the advantages to be derived from substituting cremation for burial besides those which are said to appertain to the sanitary aspect of the question, it is urged that the cost of the former is quite small when compared with that of placing a body in the ground. It is necessarily admitted that, so far as show and circumstance are concerned in the conduct of a funeral, there is no limit to the expense that may be incurred in the one case as in the other. But the necessary outlay for cremation is small when placed by the side of the indispensable expenditure involved in the purchase of ground and the decent and reverent deposition of a body therein. This will have weight with those by whom the scientific features of the question would be passed without notice. Altho it will no doubt be a long time before the burial of the dead is abolished in Christian countries, yet there seems but little doubt that cremation is yearly commending itself more and more to the thoughtful, and that it will gradually work its way into general acceptance.

JOHN STORER COBB.

The *World Almanac* for 1893 gives the

STATISTICS OF CREMATION IN THE UNITED STATES, 1876-93.

CREMATORIES.	1876-84.	1885.	1886.	1887.	1888.	1889.	1890.	1891.	1892.	1893.	Total.

Total	41	41	119	125	199	256	355	463	503	592	2,699

The *World Almanac* adds :

"The total number of deaths in the United States in 1893 was about 900,000; the number of persons cremated that year, 592. As crematories have been in existence in the United States since 1876, these statistics indicate that the movement favoring the burning of the dead is not making much progress.

"There are 23 cremation societies or incorporated companies in the United States. At the crematory at Fresh Pond, Long Island, N. Y., the price of incineration is \$35. Children under ten years, \$25. This does not include transportation or undertaker's services. No special preparation of the body or clothing is necessary. The body is always incinerated in the clothing as received. The coffin in which the body is carried to the crematory is never allowed to be removed from the building, but is burned after the incineration. In every instance of death from contagious disease the coffin will be burned with the body, and no exposure of the body will be permitted. Incineration may be as private as the friends of the deceased desire. On the day following the incineration the ashes will be deliverable at the office of the company, in a receptacle provided by it, free of cost."

THE UNITED STATES.

For the United States, the compendium to the Eleventh Census (Part II., p. 161) puts the total number of prisoners, January 1, 1890, at 82,329, of whom 75,924 were men and 6405 were women; 57,310 were white and 25,019 colored. It gives the following details:

WHITE.

Besides these prisoners there were 14,846 juvenile delinquents in reformatories, making a total of 97,175.

The compendium gives us also the following statements, among others, as to the birthplace of the parents of prisoners in the United States: Canada, 4388; England, 5997; Scotland, 1996; Ireland, 20,184; France, 1036; Germany, 9987; Italy, 1209; Mexico, 1483; Norway, 487; Poland, 339; Russia, 382; Sweden, 775; Switzerland, 384.

II. STATISTICS OF THE NATURE OF CRIMES AND CRIMINALS.

(a) THE UNITED STATES.

The following analysis of crime in the United States is abridged from the summary prepared by Professor R. P. Falkner, Ph.D., as based upon statistics for 1890 collected by the Wardens' Association of the United States and Canada. Says Professor Falkner:

"At its meeting in 1890 the Wardens' Association recognized the need of annual statistics of prisons, and endorsed a plan there presented for obtaining these statistics through its own agencies. . . . In the following the results of this first year's work are exhibited: "The figures presented are in the main for penitentiaries. While there are institutions in the list which are not so classed, yet the percentage of short-term sentences is very small. There are only 4.63 per cent of the prisoners serving sentences of less than one year's duration. In the bulletin of the *Eleventh Census* [No. 106], which gives the sentences of convicts in penitentiaries in 1890, we find 5.65 per cent. whose sentences are for less than one year. This is conclusive that in the following pages we are dealing with penitentiary convicts. In actual practice, no hard-and-fast line is drawn between the penitentiaries and jails. The former contain almost exclusively long-term convicts, and it is needless to insist on the well-known fact that they differ in many essential respects from the prisoners convicted of lesser crimes and for shorter periods.

"On June 1, 1890, there were 45,233 convicts in the penitentiaries of the United States. The tables of this report contain the data relating to 989 prisoners who were received in various institutions during

the year 1890. Judging from the sentences of the prisoners confined on June 1, the total number of prisoners received in all penitentiaries in the year 1890 must have been in the neighborhood of 17,000. It would appear, therefore, that the figures presented comprise considerably over one half of the entire number which might come within the scope of the inquiry, and this must be accounted a very remarkable result for the first attempt of an inquiry that has been wholly voluntary.

"It furnishes the best evidence that the value of the work is thoroughly appreciated, and gives great encouragement to the hope that at a second or third trial the tables will comprise the entire number of prisoners received in the penitentiaries in the year. When that result is reached, we shall have valuable material for ascertaining the quantity of crime in the United States, and its variation from year to year. In the mean time, our use of the present figures must be confined to the discussion of the qualities of prisoners as revealed by the inquiry. We have been forced to draw our conclusions from the totals for the United States, omitting Canada.

"Among the 9859 prisoners included in the tables there are only 227 females, or 2.30 per cent. of the whole number. This proportion seems extremely small, and might be explained either by the fact that females are not sent to the penitentiaries, or it may be indicative of the fact that females do not commit the more serious crimes which involve long sentences.

Sex.

That our low percentage does not arise from the more or less arbitrary selection of the institutions in our tables is shown by the fact that on June 1, 1890, the proportion of females in all the penitentiaries as shown by the census was 3.96 per cent. The supposition noted above that long-term female convicts may be confined elsewhere than in penitentiaries, is rebutted by the fact that in 1880 of all prisoners sentenced for at least one year's imprisonment only 2.78 per cent. were women. The number given therefore is about that which should be expected according to this evidence. It is of interest to note some of the deviations from this average, especially to ascertain where the quota of female prisoners is high. From the tables which are presented it will be seen that the proportion of colored to the total number is 19.65 per cent., while the proportion of colored females to the total number of females is 39.11 per cent. We must naturally expect therefore to find the quota of female prisoners largest in those States which have a considerable colored population. It is not surprising to find the average exceeded in southern Illinois, Kentucky, Maryland and North Carolina. There are, it must be admitted, other institutions which exceed the average, but they are not, like these, typical. In some cases it is evident from the table that all the female convicts from the State are in one institution, and in others that the tables contain only one of several institutions of the State.

"As the number of female prisoners in the various institutions is very small indeed, they are not specifically enumerated in the series of tables for the separate institutions. In a second series of tables, which combine the various facts ascertained with the crimes for which sentenced, females are treated separately, and an occasion will there be offered to study the manifestations of crime which may be peculiar to the sex.

"Nearly one fifth of the convicts, 19.65 per cent., are colored. This proportion is far in advance of the number of colored in the population. In 1880 there were 13.12 per cent. of colored in the population of the United States at large, but

Race, Nativity, and Parentage. as our tables do not include some of the States in which the colored race is most numerous, this comparison is not a fair one. If we consider the colored population in the States which figure in our

table, we have the still more striking contrast of 19.65 per cent. among the convicts, and only 5.59 per cent. among the general population. This enormous contingent furnished by the colored race of our penitentiaries is seen in nearly all the States.

"The question of race is simpler than that of nationality. The answer to the question as to the proportion in which the foreign element of the population contributes to the crime class will demand a more careful weighing. In 1880 the foreign born numbered 13.22 per cent. of the population of the United States, while 18.77 per cent. of the prisoners in the tables were born in foreign countries. But again the comparison does not do justice to the facts, since our tables omit a number of States in the South, where the foreign population is quite slight. In the States which figure in the tables, the proportion of foreign-born to the total population

was, in 1880, 16.72 per cent. It will be noted that the difference between the foreign-born in the penitentiaries and outside of them is very slight. But it must be remembered in this connection that we are speaking of penitentiaries, and not of all the prisons in the land. We find wide divergencies between the different sections of the country. While in some a greatly disproportionate number of foreign-born are inmates of the prisons, there are others in which the proportions are almost identical for the prisons and for the general population, and still others where a less proportion are found in the prisons than in the community. The latter States are Illinois, Michigan, Iowa, Nebraska, Minnesota, the Dakotas, Maryland, Kentucky, and Rhode Island. Here are, it will be noticed, two distinct groups, one Southern, where the foreign-born population forms an inconsiderable element of the community, and one Western, where the foreign-born element is very important. In the latter case, there can be no doubt that the favorable showing of the foreign element is to be traced to the predominant nationalities, German and Scandinavian. Rhode Island seems anomalous.

"These comparisons, tho they are often made, are in essential features defective. For it will be remembered that the foreign-born are mostly adults, while the native-born include not only the children of native parents, but also the children of foreign-born parents. The importance of this fact in this connection will be seen at once from the facts that in 1880 as many as 43.83 per cent. of the native population were under 18 years of age, while among the foreign-born the corresponding number was only 9.17 per cent. Hence, it is evident that, in estimating the criminal tendencies of these two elements, we can compare the criminals with the adult population only, and not with the total. For this purpose, the adult population has been taken to include all persons 18 years or over. We find the proportion of foreign-born to have been in the whole United States, 21.05 per cent., and in the States included in our table, 26.31 per cent. Thus since, according to our tables, 18.77 per cent. of the convicts were foreign-born, it would not appear that this element is furnishing more than its proportion to the population of the penitentiaries.

"Turning now to the States, and reversing our previous comparison, we find the States which contain a greater proportion of foreign-born convicts than foreign-born adults in the population at large to be Maine, Vermont, New York, Nevada, Oregon, Washington, and North Carolina. Disregarding the last named, where the foreign-born population does not reach 1 per cent., and where purely accidental forces would affect the result, we have again two groups, this time the extreme East and the extreme West. Here again the character of the predominant foreign elements gives the explanation of the fact observed.

"Before turning our attention to the question of the ratio in which the different nationalities which make up our foreign element contribute to the population of the prisons, we may consider the foreign element as a whole from the facts brought out relating to parentage. The figures on this subject are not so complete as those on other points, tho it is to be noted that of 6075 native-born whites, we have the facts concerning the parentage of 3897, or nearly two thirds. Lest, however, it might be supposed that this figure is too small to show the distinctive features of the criminal class in this regard, we have introduced into the following comparison the figures for all the penitentiaries as shown by the census of 1890. A study of these figures will throw light on our problems:

PARENTAGE OF THE NATIVE WHITE IN PERCENTAGES.

	Population U. S. 1880.	In Penitentiaries Studied.	All Penitentiaries U. S. 1890.
Both parents native.....	77.46	53.84	55.61
Father native, mother foreign.....	1.55	2.72	
Mother native, father foreign.....	3.63	5.67	7.56
Both parents foreign.....	17.36	29.07	
One or both unknown....	8.70	23.51
Total.....	100.00	100.00	8.32

"It will be seen that the percentage of native whites of foreign or mixed parentage is considerably greater in the prisons than in the population at large. On the other hand, the figures given above make it plain that the disproportion is not so overwhelming as is commonly supposed. The final word has not yet been said on this subject, and there can be little doubt that the figures on nationality and parentage to be furnished by the eleventh census will form a much safer basis for comparisons of this sort than those of the tenth census.

"We can form a judgment of the manner in which the different foreign elements contribute to the prisons by comparing the proportions in which the different nationalities figure, first in the population at large and then in the prisons. It is to be regretted that the census figures for 1890 on this subject are not available at present for this purpose. The figures for 1880 may be misleading, inasmuch as the character of the foreign immigration has changed so much in the past decade. In order to secure a basis of comparison, not strictly exact perhaps, in all points, but still overcoming this difficulty, we shall add to the population in 1880 the immigrants that have landed on our shores between 1880 and 1890. If we do not resort to some such method we should find certain elements in the prison population, as Italians, Hungarians, and others, which were hardly represented in the population at large. In the following comparison we give the percentage of each nationality among the foreign population of 1880 plus the foreign immigration of the years 1880-90, and also the percentage of each element of the group of foreign-born convicts comprised in our tables:

	Population.	In Penitentiaries Studied.
British America.....	12.20	13.85
England.....	10.66	11.93
Wales.....	.79	.77
Scotland.....	2.60	2.42
Ireland.....	20.36	19.02
Germany.....	27.78	21.66
Austria.....	2.82	1.43
Sweden.....	4.76	2.31
Denmark.....	1.24	.60
Norway.....	2.03	2.03
Hungary.....	1.15	1.93
Poland.....	.81	1.05
Italy.....	2.61	5.44
Mexico.....	.50	5.06
France.....	1.28	2.00
Spain.....	.08	.16
Others.....	7.36	9.24
Total.....	100.00	100.00

"From this comparison it results that the prominent elements, with the exceptions of the German and Scandinavian, on the one hand, and the British American, on the other, appear in about the same proportions in the populations as in the prisons. In the first two cases named the showing is notably in favor of these elements. In the aggregate they furnish 10 per cent. less of the total among the prisoners than they do in the population. On the other hand, the British American furnishes slightly more to the prisons than

to the population. The difference is notably marked in the case of the Italians and the Mexicans; here the disproportion is very great. It is also large in some other cases, but these are not considerable elements either in the population at large or among the convicts in our tables.

"We can in a more restricted way compare the parentage of the prisoners and of the general population. In this comparison the immigration of the last 10 years will not affect the result, since the comparison is confined to the native whites having foreign fathers. We can use for this purpose the figures for 1880 for the population, and finding the percentage of each nationality to the whole, we have this comparison:

PARENTAGE OF NATIVE PERSONS HAVING FOREIGN FATHERS.

	Population, 1880.	In Penitentiaries Studied.
British America.....	2.90	4.92
Ireland.....	34.88	51.80
Great Britain, exclusive of Ireland.....	14.63	14.40
Germany.....	38.04	21.38
Scandinavia.....	2.54	1.70
Other countries.....	7.01	5.80
Total.....	100.00	100.00

"It will be seen that so far as Germany, Scandinavia and Great Britain exclusive of Ireland are concerned, this comparison agrees with that just given above, and that the children follow in the ways of their fathers. But Ireland presents a curious case: It would appear from these comparisons, if the methods followed be correct, that while in the first generation the Irish element does not furnish more than its appropriate contingent of foreign-born children, that among the second generation of native-born persons of foreign descent, Ireland furnishes considerably more than its share. This result is certainly quite remarkable, and will hardly be accepted until it has stood the test of other investigations besides our own.

"An examination of the general average shows that a comparatively small number of the prisoners exceed 30 years of age, in round numbers only one third of the entire number. An examination of the separate States will show great uniformity in this respect, there being but few cases in which the deviation from the average is very marked. Two causes of deviation from the average occur, one purely accidental, the classification of prisoners in the different prisons of the State, and the other founded on the fact that in some of the recently settled States the proportion of men in the prime of life is generally higher than in the older States. The comparative youth of the inmates of penitentiaries is a striking fact which is observed everywhere. It may be of interest, therefore, to study in what proportions the different ages of society are represented in the prisons. It must be remembered that the prisons are recruited from the adult population, and we must compare the prisoners with this. Now, if we divide the population of the United States in 1880 over 18 years of age, according to the same classification as in our table, we have the following percentages in each class:

	Under 20.	20 to 24.	25 to 29.	30 to 39.	40 to 49.	50 to 59.	60 to 69.	70 and over.
Adult population, 1880.....	Per cent. 7.60	Per cent. 18.06	Per cent. 14.82	Per cent. 22.61	Per cent. 15.83	Per cent. 11.04	Per cent. 6.50	Per cent. 3.54
Table VI.....	18.43	28.73	19.62	20.54	7.74	3.24	1.19	.21

"It will be noted that if, in the above statement, the age of 17 had been taken as the lowest limit of the adult population, the class under 20 would have been about 10 per cent., and the other classes slightly less. We may confine ourselves more properly to the age classes above the twentieth year. It is to be observed that in the period 30 to 39, the quota of criminals approximates the proportion of that class in the com-

munity at large. After that age the proportion of criminals rapidly diminishes. In some of the States it was observed that the higher age classes are more strongly represented than on the average. An instance selected at random is Oregon, where, in the period 30 to 49, the number of criminals is considerably higher than in the whole country. But we also find that in the adult population of that State, these peri-

ods comprise 42.08 per cent. of the population, as against 38.44 per cent. in the whole United States. Similar phenomena are to be observed in a number of States.

"As many as 68.75 per cent. of the prisoners are unmarried. If we follow closely the figures of the separate States we shall find that where the age is high a larger number of convicts are married.

Conjugal Condition.

It would be rather rash to draw from the table any conclusions on marriage as a preventive of crime, since the figures may show either that married men do not commit crime or that criminals do not marry. It is to be regretted that the tenth census did not tabulate the returns on conjugal condition, as this would give us a basis of comparison. In the lack of such comprehensive figures we can present only some facts in regard to Massachusetts, taken from the census of that State in 1885. There were in that State 572,726 males who had attained the age of 20 years, and of these 171,428, or 29.93 per cent., were single. In our tables there are 861 males of 20 years or over, and assuming that all the married are over 20 years of age, there are 490, or 62.58 per cent., single. It will be seen that this figure is far in advance of that for the men of Massachusetts. But it must be remembered that the convicts are largely young men. If we should take any considerable number of persons from the free population with the same age constitution as that for the convicts in our table, we should find that the number of single persons approached much more closely to that of the convicts than it does in the general population constituted as it is.

"Among the occupations followed by the prisoners prior to their entrance into the prison, the group of professional and personal occupations predominates with 72.09 per cent. This class includes common laborers, and they form the

Occupation.

great bulk of the group. But in order to arrive at a proper view we must compare occupations of the prisoners with those of the people. In 1880 there were reported 17,392,099 persons engaged in gainful occupations, and they were thus distributed:

	Population, 1880.	Prisoners.
	Per cent.	Per cent.
Agriculture	44.11	15.27
Personal and professional ..	23.42	72.09
Trade and transportation ..	10.41	3.17
Mining, manufacturing, and mechanical	22.06	6.55
	100.00	96.98*

"The figures here quoted show us plainly that the higher the character of the daily pursuits the greater the unlikelihood of falling into crime. They show that prisoners as a rule are accustomed only to the rudest kind of labor. In the main they are unskilled, and probably also irregularly employed.

"As many as 19.56 per cent. of the prisoners could not read or write. The proportion is quite high, even tho it may not point to the fact that lack of education is the chief cause of crime. In the population over 10 years of age in 1880, the percentage of persons who could not read and write in the States named in the tables was 7.88 per cent. In all the States we find the proportion of persons unable to read or write in the prisons considerably higher than in the free population. It is this ratio which should be observed, and not the absolute amount of illiteracy in the prisons. Where this is very high, it find that illiteracy is also high in the general population. The question was asked on the cards as to the number of years of school attendance, but the replies were not sufficiently numerous nor uniform to permit of tabulation. As knowledge increases a certain minimum of information, such as reading and writing, is not difficult to obtain. Many persons who have these powers may still have received the smallest amount of education. They may be unable to do anything more than

Education.

barely read and write. It would be interesting, therefore, if some further test of educational acquirements could be applied.

"The foregoing tables have treated of qualities which the prisoner has in common with other men. We now come to those which are peculiar to him, which relate to his crime. The classification is that followed in the census of 1880. Crimes against property comprise almost exactly three fourths of the entire number, crimes against the person approximately one sixth of the number, while the remainder is about equally divided between crimes against society and those against government. If we now examine the ratios in the various States, we shall find that among the various institutions represented the fluctuation from the average in the class of crimes against property is not considerable. It is exceeded by 10 per cent. only in the reformatories of New York, Pennsylvania, Minnesota, and Texas, and these are all institutions which receive only certain classes of persons convicted of crime. A fall of 10 per cent. below the average is found only in western Pennsylvania, Vermont, Nevada, and Arizona. In the class of crimes against the person the variation from the average is more marked. If we take as a test of this fluctuation a range of 3 per cent. on either side of the average, which is roughly proportional to the 10 per cent. taken above, we shall find as many as 13 institutions which show their excess over the average, and in some cases the excess is quite large. As it was stated above, the crimes against the person constitute very nearly one sixth of all the crimes committed, but we find that in Arizona, Kentucky, and Nevada, North Dakota, Oregon, Vermont, and in the Huntsville penitentiary, Texas, this class makes up as much as one quarter of the total. This class of crimes falls below 10 per cent. of the total in the reformatories mentioned above, in the State House of Correction in Michigan, the Women's Prison in Indiana, and in the State Prison of Rhode Island. The category of offenses against society is somewhat more heterogeneous in the elements which compose it than those which we have just considered somewhat in detail. The variation from the average in the table is very wide, but as the large figures may be made up of serious offenses against the public morals, or lighter offenses, concerning, for instance, regulations for the public health, it is difficult to judge the meaning of the figures without a more minute analysis than we have been able to make.

Crime, Sentence.

"Crimes against property are most frequent among the native white crimes against the person among the colored. Both colored and foreign white are considerably higher in crimes against the person than the native white. Crimes against society average about the same in the three groups, while those against government are much below the average among the colored, doubtless for lack of opportunity. Among the females crimes against the person are more numerous than among the males, least frequent among the native white, and most among the foreign white. On the other hand, crimes against society assume an importance among the females which they do not have among the males, and the native white lead off. As a result the crimes against property, while they still form the majority of the crimes, constitute only 59.91 per cent. as against 76.01 per cent. among the males.

"It may be worth noting that about one tenth of the prisoners on our list are serving under the indeterminate sentence (see PENOLOGY). If the penitentiary convicts sentenced in 1890 be 17,000, it will be seen that 5 per cent. are being subjected to the reformatory treatment.

"The persons sentenced in the year 1890 were, for the most part, novices in crime. It will be seen that only 16.30 per cent. of them had been in prison before. I wish that we could believe it. When we find that in European countries the number of repeaters mounts up to 60, 70, and even 80 per cent., we must have some doubts as to the truth of the statements of the table. In fact, our means of tracing criminals after they leave prison are so defective that it is not improbable that twice as many have been in prison before as would appear from our table."

Thus far Professor Falkner. As to homicides, the Chicago *Tribune* has kept and printed an annual record, upon which the following table has been based:

* Furthermore, 2.79 per cent. of no occupation and 0.23 per cent. of criminal pursuits.

MURDERS AND LYNCHINGS IN THE UNITED STATES, 1886-94.

YEARS.	Murders and Homicides.	Legal Executions.	Lynchings.
1886.....	1,449	83	133
1887.....	2,335	79	123
1888.....	2,184	87	144
1889.....	3,567	98	175
1890.....	4,290	102	127
1891.....	5,006	123	192
1892.....	6,791	107	236
1893.....	6,615	126	200
1894*.....	7,747	112	165
Total.....	40,934	917	1,495

The figures in the first column represent manslaughter of all kinds when perpetrated by an individual, whether by premeditation or passion, or by an insane person, or in self-defense, rioting, duels, and resisting arrest by officers of the law. The number of homicides in the partially reported year 1894 is swollen by the deaths of rioters and others in the strike disturbances of July. The percentage of executions to killings in the nine years included in the table is 2.20. The percentage of killings to total deaths from all causes, same period (estimated), is 0.52, or about 52 per 10,000.

The compendium to the *Eleventh Census* (Part ii, p. 192) gives the following summary of the classification of crimes committed by prisoners enumerated in the census of 1890.

CRIMES.	Number.	Per Cent.
Against government.....	1,839	2.2
Against society.....	18,865	22.9
Against the person.....	17,281	21.0
Against property.....	37,797	45.8
Miscellaneous.....	6,637	8.1
Total.....	82,329	100.0

OTHER COUNTRIES.

For England, Professor Mayo-Smith's *Statistics and Sociology*, p. 267, gives from the English judicial statistics for 1891 the following facts:

CRIMES AGAINST	1879-80.		1890-91.	
	Num-ber.	Per Cent.	Num-ber.	Per Cent.
Property without violence.....	39,276	75	25,086	67.3
Property with violence	6,782	13	5,938	16
Property, malicious.....	607	1.1	513	1.4
The person.....	2,855	5.4	3,352	9
Forgery and counterfeiting.....	1,109	2.1	446	1.2
Not included in above.	1,798	3.4	1,917	5.1
Total.....	52,427	100.00	37,252	100.0

"The characteristic thing in this classification is the small number of crimes against the person, tho the proportion has increased since 1880.

"In Scotland the number of criminals convicted of offenses against the person appears to be much larger proportionately than in England, constituting 30 per cent. of the total, while those against property without violence constitute 42 per cent., and those against property with violence, 20 per cent.

"In Ireland, owing to the agrarian agitation, there has been an abnormal number of crimes against the person under the head of intimidation, and of malicious offenses against property. In 1880, for instance, over 20 per cent. of the jury trials were concerned with the former offenses, and nearly 15 per cent. with the latter.

* To October 17, 1894.

In 1891, the malicious crimes against property constituted 14 per cent. of the whole; those against the person, 19.2 per cent.; against property with violence, 5.6 per cent., and those against property without violence, 50 per cent.

"When we come to analyze still further the kinds of crime, we reach a great variety of classifications and minute subdivisions which make comparison entirely fruitless. For instance, the principal indictable offenses in England and Wales for two periods were classified as follows:

	1885-86.	1890-91.
Murder.....	136	148
Attempts to murder.....	49	64
Shooting at, wounding.....	652	789
Manslaughter.....	269	147
Concealment of birth.....	90	92
Unnatural offenses.....	156	159
Rape.....	299	232
Defilement of girls under 13 years of age.....	128
Defilement of girls between 13 and 16 years of age.....	136
Assaults with intent.....	569	769
Assaults.....	633	454
Burglary and housebreaking.....	3,418	3,418
Breaking into shops.....	2,302	2,047
Robbery and attempts with violence..	373	347
Cattle, horse, and sheep stealing.....	559	376
Larcenies, etc.....	27,797	22,367
Total indictable offenses.....	43,962	37,252

"It will be seen from this table that more than one half of the indictable offenses in England consists of larcenies. Attempts to murder and offenses against morality are sufficiently numerous, but comprise only a small percentage when compared with the crimes against property. The crimes against morality show an alarming increase."

Concerning the age and sex of criminals in England and Wales, Mr. Morrison in *Crime and Its Causes* gives the following tables:

POPULATION OF ENGLAND AND WALES IN 1871:		PRISONERS IN LOCAL JAILS IN 1888:	
Under 5.....	13,52	Under 12.....	0.1
5 and under 15.....	22,58	12 and under 16.....	2.8
15 ".....	20,000	16 ".....	16.1
20 ".....	16,66	21 ".....	30.2
30 ".....	12,80	30 ".....	24.3
40 ".....	10,05	40 ".....	14.7
50 ".....	7,32	50 ".....	6.4
60 and upward.....	7.48	60 and upward.....	5.4

He says: "These figures show that, in proportion to the population, crime is, as we should expect, at its lowest level from infancy till the age of 16. From that age it goes on steadily increasing in volume till it reaches a maximum between 30 and 40. After 40 has been passed the criminal population begins rapidly to descend, but never touches the same low point in old age as in early youth.

"Females do not enter upon a criminal career so early in life as males;* in the year 1888, while 20 per cent. of the male population of our local prisons in England and Wales were under 21, only 12 per cent. of the female prison population were under that age. On the other hand, women between 21 and 50 form a larger proportion of the female prison population than men between the same ages

* Ages and proportion per cent. of males and females committed in 1880-90:

AGES.	Males.	Females.
Under 12 years.....	0.2	0.0
12 years and under 16.....	3.1	1.1
16 ".....	17.5	10.7
21 ".....	28.4	31.4
30 ".....	23.9	28.6
40 ".....	14.2	17.5
50 ".....	6.4	6.8
60 years and above.....	6.2	3.8
Age not ascertained.....	0.1	0.1

do of the male prison population. The criminal age among women is later in its commencement and earlier in coming to a close than in the case of men.”

For France, Professor Mayo-Smith (*idem*, p. 264) quotes from the *Zeitschrift des Preuss. Bureaus*, 1882, p. 46, the following items as to proportion of accused persons per 1,000,000 inhabitants :

	CRIMES AGAINST		To-gether.	Mis-demean-ors.	Total.
	Person.	Prop-erty.			
1830-39.	67	161	228	2,081	2,309
1840-49.	64	147	211	2,983	3,190
1850-59.	64	117	181	4,241	4,420
1860-69.	51	69	120	3,869	3,980
1870-79.	51	76	127	4,316	4,443
1887....	43	70	113	5,970	6,083

Out of the 4307 persons tried before juries in France in 1887, the chief accusations were larcenies, 1439; burglary, robbery and arson, 524; murder, man-slaughter, infanticide, and fatal assault, 779; abortion and rape, 726; counterfeiting, forgery, and embezzlement, 570. The causes assigned for murder were covetousness, 25 per cent.; revenge, 22; quarrels, 22; dissipation, 10; adultery, 5; unhappy love, 4; other causes, 12.

For Germany the *Stat. Jahrbuch des Deutschen Reichs*, 1894, gives the following table of criminals convicted :

	1882.	1892.	Increase, 1882 to 1892.
			Per Cent.
Crimes against the State, public order, and religion	51,623	66,392	28.6
Crimes against the person...	107,398	157,928	47
Crimes against property...	169,334	196,437	16
Crimes in office.....	1,613	1,570
Total	329,968	422,327	28

The following table, quoted by Professor Mayo-Smith from the *Allg. Stat. Archiv*, vol. iii., p. 368, gives the number per 1000 persons of criminal age in different occupations in Germany :

HOMICIDES OF ALL KINDS IN THE FOLLOWING EUROPEAN STATES.

COUNTRIES.	Population over 10 Years.	Years.	TRIED.		CONVICTED.	
			Annual Average.	Per 100,000 Inhabitants.	Annual Average.	Per 100,000 Inhabitants.
Italy	23,408,277	1887	3,606	15.40	2,805	11.98
Austria	17,199,237	1883-6	689	4.01	499	2.90
France	31,044,370	1882-6	847	2.73	580	1.87
Belgium	4,377,813	1881-5	132	3.02	101	2.31
England	19,898,053	1882-6	318	1.60	151	0.76
Ireland	3,854,588	1882-6	129	3.35	54	1.40
Scotland	2,841,941	1882-6	60	2.11	21	0.74
Spain	13,300,889	1883-6	1,584	11.91	1,085	8.16
Hungary	10,821,558	1882-6	625	5.78
Holland	3,172,464	1882-6	35	1.10	28	0.88
Germany	35,278,742	1882-6	567	1.61	476	1.35

For statistics of prostitution and illegitimacy, see those articles.

Marro, of Italy, gives the following table of ages at which 507 offenders first began to commit crime :

Under 10...	1.5	41 to 45.....	2.1
11 to 15	17.0	46 to 50.....	2.3
16 to 20.....	36.1	51 to 55.....	2.1
21 to 25.....	20.1	56 to 60.....	.8
26 to 30.....	7.1	61 to 65.....	.8
31 to 35.....	5.1	66 to 70.....	.2
36 to 40.....	3.6		

Marro, *I caratteri dei delinquente. Studio antropologico-sociologico*, p. 356.

NUMBER PER 100,000 PERSONS OF CRIMINAL AGE CONDEMNED FOR CRIME AGAINST

	The State.	The Person.	Prop-erty.	Total.
In Agriculture	78.4	302.5	335.2	717.3
“ Industry.....	201.7	571.1	547.8	1,322.4
“ Trade and com-merce.....	294.1	550.6	621.9	1,480.0
“ Domestic service...	11.2	37.2	259.0	307.8
“ Other and no occu-pation.....	667.8	706.3	1,080.7	2,476.0

This general classification shows extraordinary differences between the different classes. The most favorable relations are found among the domestic servants, the next in agriculture, the next in industry, then trade and commerce, and, finally, those with other or no occupation. The number for these five classes stand in the relation of 1:2.4:5:8.

Comparisons between countries are dangerous, because the laws and basis of statistics in different countries are so different; but Baron Garofolo, of Italy, at the International Congress of Charities and Corrections at Chicago, in 1893, presented the following comparative statistics as to crime :

AVERAGE NUMBER OF MURDERS FROM 1881 TO 1887.	
Austria.....	687
Hungary.....	1,231
Spain.....	1,584
Italy.....	3,606
Germany.....	577
France.....	847
Belgium.....	132
Holland.....	35
England.....	311
Scotland.....	60
Ireland.....	129

ACCUSED OF THEFT AND ROBBERY.

Belgium	11,000
France	46,000
Germany	146,000
England	50,000
Italy	125,000

Mr. W. D. Morrison, of Her Majesty's Prison at Wandsworth, England, in his *Crime and Its Causes* (1891), gives the following tables :

Concerning some conclusions from statistical data, Professor Mayo-Smith says (*idem*, p. 270) : “ It is an old observation that crimes against the person are more numerous in Southern climates than crimes against property, and *vice versa*. **Conclusions.** . . . These old observations of Guerry have been confirmed in a general way by the later statistics. . . . It is apparent, however, that effect of climate and geographical position might be easily obscured

by the influence of economic and social conditions. It is pretty well determined that crimes against the person are more numerous in summer than in winter; that crimes against property are more numerous in winter than in summer. . . .

"Large numbers of the criminals are illiterate. In England, of those committed to prison in 1891, 22.8 per cent. could neither read nor write; 74.2 per cent. could read, or read and write imperfectly; 2.9 per cent. could read and write well. . . .

"Hard times increase the number of crimes, especially of crimes against property. A general rule has been laid down that as the price of food increases crimes against property increase, while crimes against the person, decrease." (See also CRIMINOLOGY.)

III. IS CRIME INCREASING?

This is a very difficult and complicated question. Men of careful judgment and extended knowledge come to very different opinions. The answer depends, in the first place, on the period one is speaking of. Comparing the present century with other centuries, at least the grosser forms of crime are certainly diminishing. Speaking simply of the present century, the decrease of crime is perhaps less clear; but as concerns security of life and property from direct violence, advance has unquestionably been made. Speaking of the immediate present, the case is still more difficult. The fact seems to be that some crimes are on the increase and some on the decrease. Professor Mayo-Smith comes to the conclusion (*Statistics and Sociology*, p. 265)

that gross crimes are decreasing and the smaller crimes increasing. Even

Difficulties of Answer. this, however, is by no means certain. It is most difficult and perhaps all but impossible to compare

the amount of crime in one country with that in another, or the amount in one period with that of another. Statistics, even when carefully collected, often utterly mislead. One reason for this is that laws materially differ. What is a crime, forbidden by law, at one period and in one country is not forbidden in another country or at another period. Crimes against education acts in some countries cannot be committed, because there are no education acts. Crimes as to drinking largely swell the modern statistics of crime; yet in former days, when everybody drank, and frequently to excess, offenses of drunkenness were not crime. Again, in former days no statistics of crime were taken. Even in recent days they have been taken very incompletely. To-day a very much larger proportion of criminality is punished and recorded than ever before in the world's history. Increased statistics of crime, both as to arrests and convictions, may therefore indicate not an increase of crime, but an increase of the moral sense of the community and of the efficiency of the repression of crime. Says the *Eleventh Annual Report of the Massachusetts Bureau of Statistics of Labor* (pp. 178 and 193): "Civilization has raised many things formerly considered perhaps as immoral and as offenses against moral law into well-defined crimes, and subject to punishment as such. The result is,

we are constantly increasing the work of criminal courts by giving prosecuting officers new fields to canvass, and by adding to the list of offenses defined as crimes. . . .

The number of offenses designated as crimes by the criminal code of Massachusetts comprehended, in 1860, 158 offenses punishable as crimes, while the code of Virginia for the same year recognized but 108, or 50 less."

Change of Laws.

Perhaps still more important is the change as to collecting the knowledge of crime. Of the apparent growth of crime, the Boston *Journal* (July 11, 1879) says: "The ubiquitous reporter is responsible for the gloomy showing. His note-book and pencil are everywhere, and the telegraph is the ready agent for transmitting views to all parts of the world. . . . We have had the curiosity to look back over some early files of the *Journal* in order to show by comparison the change which has taken place. Selecting an issue of the paper at random we find that out of 32 columns contained in the paper, precisely one third of a column is taken up with telegraph news, and two thirds of a column with local news, half of the latter space being devoted to an account of tenement-house life." **Growth of Knowledge.** Says another writer: "Years ago a crime had to be of unusual proportions to make its way into an adjoining State. Only the great crimes could cross the continent. But now we see and know everything. We skim the whole creation every morning, and put the results in our coffee."

It is only with a clear recognition of these changes in conditions that we can approach the question whether crime is on the increase. But remembering these changes, let us look for a moment to past epochs and compare them with the present. For social evils to-day, see PROSTITUTION; but compare these with classic days, when the noblest philosophers practised and openly defended not only prostitution, but unnatural vice; when in the baths of Rome thousands of men and women were abandoned *en masse* to the lowest crimes. Without referring to Rome under her degenerate Caesars, under Augustus 10,000 gladiators fought, and their bloody games were applauded by Stoic philosophers and by vestal virgins. Naturally recklessness of life spread everywhere, and philosophy defended the right of the master to kill or to torture his slaves.

Classic Times.

The immorality of Rome and Greece cannot be credited, scarcely described, in a modern cyclopedia. Take it in other lands. In England before the Norman Conquest it was the custom to buy men and women in all parts of England and carry them to Ireland for sale, the buyers usually making the women pregnant to insure a better price (*Life of Bishop Wolstan*). The one aim of life was to escape being slain if a man, and being violated if a woman. The violence and crime and bloodshed of the Middle Ages are well known. The Peace of God, when for a few days a week men agreed not to murder, was instituted to preserve society from absolute disintegration. Murders, trea-

Middle Ages.

sons, brawls, poisonings were on every hand. A nobleman declared war against Frankfort because a lady had not danced with his cousin. Together with occasional good men in the Church, the vilest men sat in the chair of St. Peter's; priests went from their mistresses to the altar, and the nunneries were like brothels. The Reformation and Puritanism checked immorality with an unnatural condemnation of all joys, that reacted in a carnival of vice and crime. In 1723 Lady Mary Montagu wrote: "Honor, virtue, and reputation, which we used to hear of in the nursery, are as much laid aside as crumpled ribbons." Says

Eighteenth Century. Lecky (*England in the Eighteenth Century*, vol. i., p. 482): "The iniquity with which outrages were committed on the ill-lit and ill-guarded streets of London during the first half of the eighteenth century can now hardly be realized. In 1712 a club of young men of the higher classes, who assumed the name of Mohawks, were accustomed nightly to sally out drunk into the streets to hunt the passers-by. . . . One of their favorite amusements, called 'tipping the lion,' was to squeeze the nose of their victim flat upon his face, and to bore out his eyes with their fingers. . . . [Another] favorite amusement was to set women on their heads and commit various indecencies and barbarities on the limbs that were exposed. . . . Country gentlemen went to the theater as if in a time of war, accompanied by their armed retainers." Macaulay, in his well-known picture of England of the seventeenth century, confirms the same picture of London being utterly unsafe by night, while the country was unsafe by night or day. Banditti and highwaymen infested the roads near London, and ruled the remoter sections.

In America Puritanism first enforced a rigid morality, which, however, gradually declined. Drunkenness became prevalent. Says Theodore Parker (*Speeches, Addresses, and Occasional Sermons*, pp. 341-97): "It is recorded in the Probate Office that in 1678, at the funeral of Mrs. Mary Norton, widow of the celebrated John Norton, one of the ministers of the First Church in Boston, 51½ gallons of the best Malaga wine were consumed by the mourners. . . . Towns provided intoxicating drink at the funeral of paupers." The Rev. Leonard Woods says: "I remember when I could reckon up among my acquaintances 40 ministers who were intemperate." According to Dr. Dorchester, to whom we are indebted for much of the above information (*Problems of Religious Progress*, p. 301), the per capita consumption of distilled spirits in the United States was, in 1810, 4.30 galls.; 1820, 7.26 galls.; 1830, 6.02 galls.; 1840, 2.54 galls.; 1850, 2.21 galls.; 1860, 2.86 galls.; 1870, 2.05 galls.; 1880, 1.27 galls.; 1890, 1.40 galls.; 1893, 1.51 galls.

Intemperance led to quarrels and duelling. Says Dr. Dorchester (*idem*, p. 484): "Not less than 14 of the most prominent statesmen in the United States, not to speak of many of lesser rank, were concerned in duels in the first half of the present century." The *Christian Advo-*

cate of November 30, 1876, argues that financial dishonesty was greater earlier in the century than now. It says: "In the time of Van Buren the loss was \$21.15 on every \$1000; now it is only 26 cents." Whatever one thinks of these statements, it is evident that there were gross evils in other countries and in former decades which statistics cannot cover, but which must not be forgotten in studying the questions of crime.

Coming to the period when statistics are available, the best that can be done is to put side by side the views of those who do and of those who do not believe that crime is on the increase.

Mr. W. D. Morrison, of H. M. Prison, Wandsworth, England, strongly maintains that crime is on the increase. He says (*Crime and its Causes*, p. 12):

"Most of the principal authorities in Europe and America are emphatically of opinion that crime is on the increase. In the United States, we are told by Mr. D. A. Wells* and by Mr. Howard Wines, an eminent specialist in criminal matters, that crime is steadily increasing, and that it is increasing faster than the growth of the population.

"Nearly all the chief statisticians abroad tell the same tale with respect to the growth of crime on the Continent. Dr. Mischler, of Vienna, and Professor von Liszt, of Marburg, draw a deplorable picture of the increase of crime in Germany. Professor von Liszt, in a recent article,† says that 15,000,000 persons have been convicted by the German criminal courts within the last 10 years; and, according to him, the outlook for the future is somber in the last degree. In France, the criminal problem is just as formidable and perplexing as it is in Germany; M. Henri Joly estimates that crime has increased in the former country 133 per cent. within the last half century, and is still steadily rising. Taking Victoria as a typical Australasian colony, we find that even in the Antipodes, which are not vexed to the same extent as Europe with social and economic difficulties, crime is persistently raising its head, and altho it does not increase quite as rapidly as the population, it is nevertheless a more menacing danger among the Victorian colonists than it is at home.‡

"Is England an exception to the rest of the world with respect to crime? Many people are of opinion that it is, and the idea is at present diligently fostered on the platform and in the press that we have at last found out the secret of dealing successfully with the criminal population. As far as I can ascertain, this belief is based upon the statement that the daily average

* "In the United States, while crime has diminished in a few States, for the whole country it has, within recent years, greatly increased. In 1850 the proportion of prison inmates was reported as one to every 3448 of the entire population of the country; but in 1880 this proportion had risen to one for every 855. These results are believed to be attributable in the Northern States mainly to the great foreign immigration, and in the Southern to the emancipation of the negroes." (*Recent Economic Changes*, p. 345)

† *Zeitschrift für die gesamte Strafrechtswissenschaft* ix. 472, 88.
‡ See *Statistical Register for Victoria*, Part viii.

of persons in prison is constantly going down. Inasmuch as there was a daily average of over 20,000 persons in prison in 1878, and a daily average of about 15,000 in 1888, many people immediately jump at the conclusion that crime is diminishing. But the daily average is no criterion whatever of the rise and fall of crime. Calculated on the principle of daily average, 12 men sentenced to prison for one month each will not figure so largely in criminal statistics as one man sentenced to a term of 18 months. The daily average, in other words, depends upon the length of sentence prisoners receive, and not upon the number of persons committed to prison, or upon the number of crimes committed during the year. Let us look then at the number of persons committed to local prisons, and we shall be in a position to judge if crime is decreasing in England or not. We shall go back 20 years, and take the quinquennial totals as they are recorded in the judicial statistics :

Total of the 5 years, 1868 to 1872.....	774,667
Total of the 5 years, 1873 to 1877.....	866,041
Total of the 5 years, 1884 to 1888.....	898,486

If statistics are to be allowed any weight at all, these figures incontestably mean that the total volume of crime is on the increase in England as well as everywhere else. It is fallacious to suppose that the authorities here are gaining the mastery over the delinquent population. Such a supposition is at once refuted by the statistics which have just been tabulated, and these are the only statistics which can be implicitly relied upon for testing the position of the country with regard to crime.

"Seeing, then, that the total amount of crime is regularly growing, how is the decrease in the daily average of persons in prison to be accounted for? This decrease may be accounted for in two ways. It may be shown that altho the number of people committed to prison is on the increase, the nature of the offenses for which these people are convicted is not so grave. Or, in the second place, it may be shown that, altho the crimes committed now are equally serious with those committed 20 years ago, the magistrates and judges are adopting a more lenient line of action, and are inflicting shorter sentences after a conviction. Let us for a moment consider the proposition that crime is not so grave now as it was 20 years ago. In order to arrive at a fairly accurate conclusion on this matter, we have only to look at the number of offenses of a serious nature reported to the police. Comparing the number of cases of murder, attempts to murder, manslaughter, shooting at, stabbing and wounding, and adding to these offenses the crimes of burglary, house-breaking, robbery, and arson—comparing all these cases reported to the police for the five years 1870-74 with offenses of a like character reported in the five years 1884-88, we find that the proportion of grave offenses to the population was, in many cases, as great in the latter period as in the former.

SERIOUS CASES REPORTED TO THE POLICE IN PROPORTION TO THE POPULATION. ANNUAL AVERAGE FOR FIVE YEARS.

	Murder.	Attempts to Murder.	Man-slaughter.
1870-74.....	1 to 196,046	1 to 441,158	1 to 92,756
1884-88.....	1 to 168,897	1 to 418,923	1 to 116,403
	Shooting, Stabbing, etc.	Burglary.	House-breaking.
1870-74.....	1 to 35,033	1 to 10,188	1 to 17,538
1884-88.....	1 to 33,607	1 to 7,892	1 to 11,911

This table shows that since 1870-74 there has been an increase in murder, attempts to murder, burglary, and housebreaking, and a decrease in manslaughter, robbery, and arson. The decrease in shooting, stabbing, wounding, etc., is very small. (Cf. *Judicial Statistics* for 1874 and 1888, p. xvi.)

This shows clearly that crime, while it is increasing in extent, is not materially decreasing in seriousness; and the chief reason the prison population exhibits a smaller daily average is to be found in the fact that judges are now pronouncing shorter sentences than was the custom 20 years ago. We are not left in the dark upon this point; the judges themselves frequently inform the public that they have taken to shortening the terms of imprisonment. The extent to which sentences have been shortened within the last 20 years can easily be ascertained by comparing the committals to prison and the daily average of the quinquenniad 1868-72 with the committals and the daily average of the quinquenniad 1884-88. A comparison between these two periods shows that the length of imprisonment has decreased 26 per cent. In other words, whereas a man used to receive a sentence of 12 months' imprisonment, he now receives a sentence of nine months; and whereas he used to get a sentence of one month, he now gets 21 days. If it be a serious offense, or if the criminal be a habitual offender, he now receives 18 months' imprisonment, whereas he used to receive five years' penal servitude. As far as most judges and stipendiary magistrates are concerned, sentences of imprisonment have decreased in recent years more than 26 per cent.; and if there was a corresponding movement on the part of chairmen of Quarter Sessions, the average decrease in the length of sentences would amount to 50 per cent. But it is a notorious fact that amateur judges are, with few exceptions, more inclined to pronounce heavy sentences than professional men.

Shorter Sentences.

"We have now arrived at the conclusion that crime is just as serious in its character as it was 20 years ago, and that it is growing in dimensions year by year; the next point to be considered is, the relation in which crime stands to the population. Crime may be increasing, but the population may be multiplying faster than the growth of crime. Is this the condition of things in England at the present day? We have seen that the criminal classes are increasing much faster than the growth of population in France and the United States. Is England in a better position in this respect than these two countries? At the present time there is one conviction to about every 50 inhabitants, and the proportion of convictions to the population was very much the same 20 years ago. If we remember the immense development that has taken place in the industrial school system within the last 20 years—a development that has undoubtedly had a great deal to do with keeping down crime—we arrive at the conclusion that, notwithstanding the beneficent effects of industrial schools, the criminal classes in this country still keep pace with the annual growth of population."

Of the United States, Mr. H. M. Boies (*Prisoners and Paupers*, p. 1) says: "The Eleventh Census of the United States, as it is being published, furnishes statistics of a national growth in numbers, wealth, and general prosperity unparalleled in the history of civilization. . . . Some of the disclosures made are, however, shocking, if not appalling, in the highest degree to our confidence in the future. One of these is the abnormal and disproportionate increase in the criminal class in society. That increase is from 1 in 3500 of our population in 1850 to 1 in 786.5 in 1890, or of 445 per cent.; while the population has increased but 170 per cent. in the same period.

"In the last decade, with an increase of 24.5 per cent. in population, the number of the inmates of our penitentiaries, jails, and reformatories has increased 45.2 per cent., or nearly twice faster than the general population."

Dr. Josiah Strong (*Our Country*, p. 57) says: "From 1870 to 1880 the population increased 30.06 per cent. During the same period the number of criminals increased 82.33 per cent.

In 1850, there were 290 prisoners to every million of the population ; in 1860, there were 607 to each million ; in 1870, there were 853, and in 1880 there were 1169. That is, in 30 years the proportion of criminals increased fourfold."

He lays this mainly to foreign immigration. But see Professor Falkner's analysis above.

Mr. George R. Stetson, writing in the *Andover Review* for December, 1884, argues a decadence in Massachusetts even among the native white population. He says :

"By the United States Census returns for 1850 we find that the total population of Massachusetts was 994,514 and the number in prisons 1236, or 1 prisoner to 824+ of the population, and in 1880, with a population of 1,783,085, there were in prisons 3659, or 1 prisoner to 487+ of the population; in other words, our prison population, in proportion to the whole population, has nearly doubled in 30 years.

"If it is objected that this does not show the actual amount of crime for which our own institutions are responsible, owing to the great number of idle, ignorant, and vicious immigrants landed upon our shores, we answer, that the examination of the statistics of our native prisoners, from which, of course, the foreign element is entirely excluded, will show that their number, when compared with the whole native population, has increased from 1 in 1267+ as in 1850, to 1 in 615+ in 1880, as can be ascertained by the following table compiled from the United States Census :

	Total Population.	Native Population.	Prisoners.	Native Prisoners.	Proportion.
1850.....	994,514	827,430	1,236	653	1 in 1,267 +
1860.....	1,783,085	1,339,594	3,659	2,175	1 in .615 +

"Stated in another form, our native criminal population has more than doubled in 30 years, notwithstanding our system of public instruction, our churches, our schools, our charitable institutions, and all the educational efforts and appliances known to modern civilization.

"In addition, we find by the same table that in 1850 over one half, and in 1880 nearly two thirds, of the total number of the prison population were natives. As convincing as these statistics of our retrogradation seem, they are thrown into

Foreign Population. obscurity by the really appalling fact which appears in the *Report of the Prison Commissioners for Massachusetts* in 1884 (p. 126)—namely, that the entire number of arrests for crime for the year ending September 30, 1883, was 65,000, or one arrest for every 29+ of the inhabitants of this commonwealth; and assuming that five persons constitute a family, we have the alarming result of one arrest to every six families in the entire State."

It should be remembered, however, that the foreign born by no means measure the contribution of foreign conditions to America. Says Dr. Josiah Strong (*Our Country*, p. 57) :

"The hoodlums and roughs of our cities are, most of them, American born of foreign parentage. Of the 680 discharged convicts who applied to the Prison Association of New York for aid during the year ending June 30, 1882, 442 were born in the United States, against 238 foreign born ; while only 144 reported native parentage against 536 who reported foreign parentage.

"The Rhode Island Workhouse and House of Correction had received, to December 31, 1882, 6202 persons on commitment. Of this number, 52 per cent. were native born and 76 per cent. were born of foreign parentage. Of

the 182 prisoners committed to the Massachusetts Reformatory for Women in 1880-81, 81 per cent. were of foreign birth or parentage. While in 1880 the foreign born were only 13 per cent. of the entire population, they furnished 19 per cent. of the convicts in our penitentiaries, and 43 per cent. of the inmates of workhouses and houses of correction."

See, on the other hand, Professor Falkner's analyses above, in Sec. II.

Mr. W. F. Spaulding, too, in the *Forum* for January, 1892, shows that the increase of commitments in Massachusetts is almost wholly for drunkenness, and that for serious crimes there has been a decrease.

Of the United States generally there is still wider room for difference of opinion. The statistics unquestionably show not only a large absolute growth in the number of prisoners, but a growth in the proportion to the population. Yet it is unquestionably true that the early statistics were not complete. The only question is as to how complete are the present statistics.

In England, in opposition to Mr. Morrison, Mr. E. F. Du Cane, Inspector of Prisons, argues, in the *Nineteenth Century* for March, 1893, that crime is rapidly on the decrease. He holds that the statistics brought forward to show an increase of crime are misleading, because they include offenses that are not really crimes, but simply show an extension of law. "Offenses," he says, "against the Education Acts could not be committed before 1870, but they count for 96,601 in 1890-91." He argues, also, that to add the number of criminals and the juveniles committed to industrial reformatories, and then quote the number as indication of an increase of crime is like adding the number of cases of small-pox and the number vaccinated to prevent their having the disease, and using the whole number to show the spread of the disease. He argues similarly of the increase of the police. So, too, one must not look at the number *tried* for crime, but at the actual number of crimes committed. More people may be tried as the police grow more competent ; but the question is, How many crimes are committed? As to this, he says the **Crime Said to be on the Decrease.**

average number in local prisons in 1876-77 was 20,361 ; in 1890-91, 12,663. At the end of 1869 there were 9726 convicts in prison. On March 31, 1892, there were 4701. He says these facts cannot be explained by the shortening of sentences. If there has been any shortening, it is not enough to account for so large a decrease. He says that we must distinguish between what most people mean by crimes and mere offenses against education, acts, etc. The judicial statistics define crimes in five classes :

I. Offenses against the person, including assaults.

II. Offenses against property with violence.

III. Offenses against property without violence, including stealing, embezzlement, offenses against the game acts, etc.

IV. Malicious offenses against property, destroying fences, fruit, trees, etc.

V. Forgery and offenses against the currency.

Of these, Mr. Du Cane gives the following facts, meaning by the word "indictable" those not summarily dealt with.

"Indictable offenses in these five classes have fallen as a whole since 1867-68, when the number was 57,812, and the fall has been almost continuous since 1877-78, when the number was 52,397, till in 1890-91 the number was 25,335. Summary offenses in the same five classes have been falling since 1873-74, when the number was 192,440. In 1890-91 the number was 159,534."

Of the different classes, he says that indictable offenses in Class I. fluctuated very much before 1884-85, when they suddenly rose, and stood in 1885-86 at 362,6, since when they have fallen somewhat, and stood in 1890-91 at 3352. Summary offenses in Class I. have fallen almost continuously from 100,422 in 1875-76 to 77,857 in 1890-91.

In Class II. he says it is almost impossible to give the fluctuations of indictable offenses, tho since 1881-82 the tendency has been to fall. The summary offenses in this class are too small to be noticed. They never have been over 87, and sometimes have been as low as 1.

In Class III. indictable offenses have fallen almost continuously from 41,341 in 1877-78 to 25,086 in 1890-91. This, he says, is explained by some as due to the Summary Jurisdiction Act of 1879, which, he thinks, only accounts for a diminution of 3000 out of a net fall of 16,000. The summary offenses were increased by the diminution in the indictable offenses, for they remained about the same from 1879 to 1882, when they were

72,434, since when they have steadily fallen to 62,990 in 1890-91.

In Class IV. indictable offenses have scarcely changed, being about 600. Summary offenses have fallen from 25,800 in 1873-74 to 18,675 in 1890-91.

In Class V. offenses have fallen from 2839 in 1856-57 to 446 in 1890-91.

Mr. Du Cane quotes various authorities to substantiate these indications, a recent report of the Commissioner of Police of the metropolis saying :

"The criminal returns for 1890 disclose a most satisfactory record for the year. The felonies relating to property numbered 17,491, or 2053 fewer than in 1889, tho the figures for 1889 were a marked improvement on those for the preceding year. . . . There were fewer offenses of this kind committed in the metropolis during 1890 than in any year since

1875. But in 1875 the felonies of this class were relatively to the population in the ratio of 4.182 per 1000, whereas last year the proportion per 1000 was only 3.002, or less than half the number considered normal 20 years ago. . . . Serious crimes against the person were also relatively to population fewer than ever before. It thus appears that there was greater security for person and property in the metropolis during 1890 than in any previous year included in the statistical returns. It should be remembered that in relation to police work the difficulties of dealing with crime, as each decade adds a million to the population of the metropolis, are augmented in a ratio far greater than that of the arithmetical increase."

The Chief Constable of Liverpool says :

"Never, since the first publication of returns of crime in Liverpool (*i.e.*, since 1857), have the statistics disclosed so small an amount of crime or so large a success in making criminals amenable to justice as those for the year ended September 29, 1891."

Mr. Grosvenor, just before leaving the Home Office, read to the Statistical Society in 1890 a paper entitled *The Abatement of Crime*, in which he summed up the matter thus :

"Combined causes have materially assisted in securing the abatement shown to have taken place in nearly all classes of crime during the last 20 years, while the great reduction in the number of known thieves and other suspected persons at large, as well as in the houses of bad character which they frequent, and more especially the extraordinary diminution in the number of receivers of stolen goods, has made manifest the

increasing efficiency of the police. When to this is added the fact that during the period in question the population of England and Wales has increased by nearly 6,500,000, we must admit that the many agencies enlisted for the purpose of diminishing the number of criminals have been most successfully applied, and the result cannot fail to afford the utmost satisfaction and encouragement to all who are anxious for the improved moral and physical advancement of our nation."

Mr. Du Cane quotes Sir William Harcourt as saying : "It is better to be an optimist after full inquiry than a pessimist without."

CRIMINAL ANTHROPOLOGY is the science of the study of the criminal. Altho there were previously, of course, much consideration and some shrewd judgments as to criminals, the science of criminal anthropology may be said to date from 1876, when Cesare Lombroso published his epoch-making work, *L' Uomo Delequente*. (For a general consideration of crime, see CRIMINOLOGY; for the statistics of crime, see CRIME.)

To understand what the scientific study of a criminal means, we give in detail important points noted by Benelli, Tamburini, and Lombroso.

Generalities.--Name, age, country, profession, civil state.

1. *Anthropometrical examination.*--Development of skeleton, stature, development of muscular system, weight. Color: of skin, hair, iris, uniformly colored, double coloration, peripheral and central, non-uniformly colored, color predominant, color not predominant, beard. Piliferous system. Tattooing. Craniometry: face, height, bizygomatic diameter, facial type, facial index; nose: profile, dimensions, direction, anomalies; teeth: form, dimensions, anomalies; eye; neck; thorax; lungs; heart; genital organs; disfigurements.

2. *Examination of sensibility.*--Touch: electric current, left hand, right hand, tongue; aesthesiometer of Weber: right hand, left hand, tongue. Pain: algometer of Lombroso; left and right hands, tongue. Sensibility: muscular, topographic, thermic, meteorological, magnetic, metallic, hypnotic, hypnotic credulity, visual, acoustic, olfactive, gustative, chromatic, sensual (generative); first sensual relations, aberrations; anomalies.

3. *Examination of motility.*--Voluntary movements: gait, speech, language, writing, reflexes; muscular force; dynamometry; manual skill; anomalies.

4. *Examination of vegetative functions.*--Circulation, respiration, thermogeny; digestion; secretions: saliva, urine, sweat.

5. *Psychical examination.*--Perception (illusions); ideation (hallucinations); reasoning; will (impulsion); memory; intelligence: works, writings; slang; conscience; sentiments: affective, moral, religious; passions; instincts; sleep; moral sense; habitual expression of physiognomy; psychometry; anomalies.

6. *Anamnestic examinations.*--Family, parents; state of family; daughters; sons; age of parents; history, diseases, crimes of parents. Precedents; education, instruction, intellectual and political development, diseases; traumatic accidents, crimes, habitual character, occupation preferred. Latest information: last crimes, cause of crime, repentance, admissions, nervous diseases and mental anomalies (intercurrent); inquiries.

In regard to these various points, however, criminologists are by no means agreed as to their being a criminal type. In his *Crime and its Causes* (chap. vii.) Mr. W. D. Morrison brings out the variety of conclusions. He says (we abridge his words), as to height: "Lombroso says that Italian criminals are above the average height; Knecht says German criminals do not differ in this respect from other men; Marro says the stature of criminals is variable; Thom-

son and Wilson say that criminals are inferior in point of stature to the average man. What-

ever may be the case on the Continent, there can be little doubt that

Physiology. as far as the United Kingdom is concerned, the height of the criminal class is lower than that of the ordinary citizen. In Scotland the average height of the ordinary population is 67.30 inches; the average height of the criminal population, as given by Dr. Bruce Thomson, is 66.95 inches. According to Dr. Beddoe, the average height of the London artisan population is 66.72 inches; the average height of the London criminal 64.70 inches; the average height of Liverpool criminals, according to Danson, is 66.39 inches.

"As to weight, Lombroso and Marro assert that Italian criminals weigh more than average citizens. On the other hand, the weight of London criminals is almost the same as that of London artisans, but inferior to the weight of the artisan population in the large English towns taken as a whole. The average weight of London criminals is 136 lbs.; average weight of London artisans, 137 lbs.; average weight of artisans in large towns generally, 138 lbs. The London criminal is considerably inferior in weight to the well-to-do classes, as will be seen from Mr. Galton's Health Exhibition statistics. Average weight, Health Exhibition, 143 lbs.; average weight, most favored class (Roberts), 152 lbs. Respecting the skulls of criminals, the inquiries of continental investigators have so far led to very conflicting results. It is a contention of Lombroso's that the skulls of criminals exhibit a larger proportion of asymmetrical peculiarities than the skulls of other men. On this point Lombroso is supported by Manouvrier. But Topinard, an anthropologist of great eminence, is of an opposite opinion. He carefully examined the same series of skulls as had been examined by Manouvrier—the skulls of murderers—and he discovered no marked difference between these and other skulls. At present we must wait for further light before anything can be said with certainty with respect to the criminal skull.

"Just as little is known at present about the brain of criminals as about the skull. Some years ago Professor Benedict startled the world by stating that he had discovered the seat of crime in the convolutions of the brain. He found a certain number of anomalies in the convolutions of the frontal lobes, and he came to the conclusion that crime was connected with the existence of these anomalies. But he had omitted to examine the frontal convolutions of honest people. When this was done by other investigators, it was found that the brain convolutions of normal men presented just as many anomalies, some investigators (Dr. Giacomini) said even more than the brains of criminals. According to Dr. Bardeleben, there is no such thing as a normal type of brain. Weight of brain is a much simpler question than brain type, but so far it is impossible to say whether the criminal brain is heavier or lighter than the ordinary brain. The solution of this comparatively simple point is beset by a certain number of obstacles.

"An examination of the criminal face has so far led to no definite and assured results. In the imagination of artists the criminal is almost always credited with a retreating forehead. As a matter of fact, representatives of the anthropological school assure us that this is not the case. After comparing the foreheads of 539 delinquents with the foreheads of 100 ordinary men, he found that criminals had a smaller percentage of retreating foreheads than the average man. He also found that projecting eyebrows, another trait which is supposed to be a criminal peculiarity, were almost as common among ordinary people as among offenders against the law. Projecting ears is another peculiarity which is often associated with the idea of a criminal. But Dr. Lannois states that after a careful examination of the ears of 43 young offenders, he found them as free from anomalies as the ears of other people.

"Careful inquiries have been undertaken by criminal anthropologists into the color of the hair, the length of the arms, the color of the skin, tattooing, sensitiveness to pain among the criminal population; but these laborious investigations have so far led to few solid conclusions. According to Lombroso, insensibility to pain is a marked characteristic of criminals, but M. Joly denies this. In this connection it must be borne in mind that a prolonged period of imprisonment will change the face of any man, whether he is a criminal or not. If a man spends a certain number of years sharing the life, the food, the occupations of five or six hundred other men, if he mixes with them and with no one else, he will inevitably come to resemble them in face and feature. A remarkable illustration of this fact has recently been brought to light by the Photographic Society of Geneva.

'From photographs of 78 old couples, and of as many adult brothers and sisters, it was found that 24 of the former resembled each other much more strongly than as many of the latter who were thought most like one another.' It would, therefore, seem that the action of unconscious imitation, arising from constant contact, is capable of producing a remarkable change in the features, the acquired expression frequently tending to obliterate inherited family resemblances. According to Piderit, physiognomy is to be considered as a mimetic expression which has become habitual. The criminal type of face, so conspicuous in old offenders, is in many cases merely a prison type.

"Summing up our inquiries respecting the criminal type, we arrive, in the first place, at the general conclusion that so far as it has a real existence it is not born with a man, but originates either in the prison, and is then merely a prison type, or in criminal habits of life, and is then a truly criminal type. As a matter of fact, the two types are in most cases blended together, the prison type, with its hard, impassive rigidity of feature, being superadded to the gait, gesture, and demeanor of the habitual criminal. In combination these two types form a professional type and constitute what Dr. Bruce Thomson has called 'a physique distinctly characteristic of the criminal class.' It is not, however, a type which admits of accurate description, and its practical utility is impaired by the fact

that certain of its features are sometimes visible in men who have never been convicted.

"In regard to psychological characteristics, deficiencies in memory, imagination, reason, are three undoubted characteristics of the ordinary criminal intellect. Of course, there are very many criminals in which

Psychology. all these qualities are present, and whose defects lie in another direction, but taken as a whole the criminal is unquestionably less gifted intellectually than the rest of the community.

"Respecting the emotions of criminals, it is much more difficult to speak, and much more easy to fall into error. The only thing that can be said of them for certain is that they do not, as a rule, possess the same keenness of feeling as the ordinary man. Some Italian writers make much of the religiosity of delinquents; such a sentiment may be common among offenders in Italy; it is certainly rare among the same class in Great Britain. The cellular system puts an effective stop to anything like active hostility to religion; but it is a mistake to argue from this that the criminal is addicted to the exercise of religious sentiments. The family sentiment is also feebly developed; the exceptions to this rule form a small fraction of the criminal population.

"The will in criminals, when it is not impaired by disease, is, in the main, dominated by a boundless egoism. He may have a sense of duty or a fear of punishment, but his immense egoism demands gratification at any cost.

"The criminal's will is, however, usually diseased. In some cases of this description the will is practically annihilated; in others it is under the dominion of momentary caprice; in others, again, it has no power of concentration, or it is the victim of sudden hurricanes of feeling which drive everything before them. Persons afflicted in this way, when not drunkards, are generally convicted for crimes of violence, such as assault, manslaughter, murder. They experience real sentiments of remorse, but neither remorse nor penitence enables them to grapple with their evil star. The will is stricken with disease, and the man is dashed hither and thither, a helpless wreck on the sea of life.

"There are thus immense differences between criminals. But it can be shown that criminals, taken as a whole, exhibit a higher proportion of physical anomalies, and a higher percentage of physical degeneracy

Degeneracy. than the rest of the community. With respect to the mental condition of criminals, it cannot be established that it is, on the whole, a condition of insanity, or even verging on insanity. But it can be established that the bulk of the criminal classes are of a humbly-developed mental organization. Whether we call this low state of mental development, atavism, or degeneracy is, to a large extent, a matter of words; the fact of its widespread existence among criminals is the important point.

"The results of this inquiry also show that degeneracy among criminals is sometimes inherited and sometimes acquired. It is inherited when the criminal is descended from insane, drunken, epileptic, scrofulous parents; it is often acquired

when the criminal adopts and deliberately persists in a life of crime. The closeness of the connection between degeneracy and crime is, to a considerable extent, determined by social conditions. A degenerate person, who has to earn his own livelihood, is much more likely to become a criminal than another degenerate person who has not. Almost all forms of degeneracy render a man more or less unsuited for the common work of life; it is not easy for such a man to obtain employment; in certain forms of degeneracy it becomes almost impossible. A person in this unfortunate position often becomes a criminal, not because he has strong anti-social instincts, but because he cannot get work. Physically, he is unfit for work, and he takes to crime as an alternative.

"Another important result is the close connection between madness and crimes of blood. We have seen that almost one third of the cases of conviction for wilful murder are cases in which the murderer is found to be insane. And this does not represent the full proportion of murderers afflicted mentally; a considerable percentage of those sentenced to death have this sentence commuted on mental grounds. In Germany, from 26 to 28 per cent. of criminals suffering from mental weakness escape the observation of the courts on this point, and so elsewhere. The actual percentage of criminals who suffer from mental disorders is probably much greater than is generally supposed."

So far Mr. Morrison. Mr. H. M. Boies, in his *Prisoners and Paupers* (chap. xii.), says:

"Herr Sichert, director of prisons of Würtemberg, found by inquiry extending over several years, and including 1714 cases, that 'over one fourth of the German prison population had received a defective organization from their ancestry, which manifests itself in a life of crime.' Dr. Vergilio says that 'in Italy 32 per cent. of the criminal population have inherited criminal tendencies from their parents.' According to Dr. H. Maudsley, 'the idiot is not an accident, nor the irremediable criminal an unaccountable causality.' Of the 527 convicts received in the Eastern Penitentiary of Pennsylvania in 1890, 93 were upon their third or more sentence. Seventeen of these had been detected, arrested, tried, and convicted more than six times. One of them was to serve his fourteenth sentence; 68 of these prisoners had relatives who were then or had been in prison; and 103 were received upon their second sentence.

"In a paper on *Criminal Anthropology*, read before the National Prison Association in Cincinnati, Dr. H. D. Wey, physician to the New York State Reformatory, quotes from Dr. J. S. Wright:

"The concurrent and unanimous testimony of those who are, from their experience and knowledge, most competent to judge, is: that the great underclass of criminals have more or less defective organizations, especially as relates to their nervous system, and more especially as to their brain; that they are more or less deficient in moral sense, showing in this respect the lack of development or result of decay; the best and last developed sense, the moral sense, disintegrating first of all; that they are perversely wicked and indomitably inexpedient, committing crimes when doing right would be of more use to them; that they are as passionate as the wild beasts of the forest, and as restless as the ocean that heaves with every gust of wind; that they are at war with mankind and ever in commotion with themselves; that they are like the ship beaten out by the storm—the ship without compass, rudder, or captain; they are formed and fashioned by the hand of an evil genius whose name is bad heredity, and whose handmaid is ignorance; and that their reformation ought to have begun in their ancestors."

"Dugdale in his study of the 'Juke' family traces 1200 criminals and paupers impregnated with the

Heredity.

vicious blood of one ancestor in seven generations, who cost the public over \$1,300,000.

"Rev. O. McCulloch, of Indianapolis, discovered and identified 1750 descendants of Ben Ishmael, living in Kentucky in 1790, who had been criminals and paupers, among whom 121 were prostitutes. In six generations 75 per cent. of the cases treated in the City Hospital in Indianapolis were of the tribe of Ben Ishmael. Court Pastor Stocker, of Berlin, investigated the history of 834 descendants of two sisters, the eldest of whom died in 1825. Among these he found 76 who had served 116 years in prison for serious crimes, 164 prostitutes, 106 illegitimate children, 17 pimps, 142 beggars, 64 paupers in almshouses; estimated to have cost the State more than \$500,000.

"The trustees of the Children's Home in Washington County, O., in their eighteenth annual report, state that 66 per cent. of the inmates of their home from that county in the preceding two years had been related by blood or marriage.

"Major McClaughey, the eminent penologist who had charge of the Joliet Prison in Illinois for many years, and lately resigned the superintendence of the Huntington Reformatory in Pennsylvania, to accept the office of Chief of Police in Chicago, says, 'that criminal parentage, and association, and neglect of children by their parents,' are the great causes of the increase of criminality in America.

"The best authorities abroad fix the proportion of the incorrigible at from 25 to 32 per cent. of the convicts. In America it is undoubtedly larger, because we have so long offered an open haven of refuge to all people, without any application of our proverbial common sense to penal legislation and management."

Mr. Arthur MacDonald, in his *Criminology*, adds many important facts, giving more weight to Professor Lombroso's conclusion than does Mr. Morrison. (See above.) He says:

"From 70 children less than 12 years of age confined in houses of correction, among whom were 40 thieves, 27 vagabonds, 7 homicides, and 3 whose crime is not stated, Lombroso finds as predominating anomalies: 30 with deformed ears, 21 with small, retreating foreheads, 10 **Asymmetry**, plagiocephalic, 16 with projecting cheekbones, 14 with prominent jaws, 7 with raised frontal sinuses, 6 hydrocephalic, 5 cross-eyed, 14 with facial asymmetry, 10 with physiognomy of retins, 9 goitrous, and 9 with deformed nose."

The following table is based upon 3000 cases studied by independent investigators, by Lombroso, Legge, and Amodei:

TABLE OF ASYMMETRY.

	MALES.		FEMALES.		Savage.	Insane.
	Normal.	Criminal.	Criminal.	Normal.		
	Per Cent.	Per Cent.	Per Cent.	Per Cent.		
Plagiocephalic heads.....	20.0	42.0	21.0	17.2	...	24.0
Cranial sclerosis.....	18.0	31.0	31.0	17.2	100.	50.0

Concerning the intelligence of criminals, Dr. MacDonald says:

"In intelligence the criminal is below the average. It must be remembered that the wandering and uncertain life of a criminal and his knocking about in the world favor a development of his intelligence. The first in Europe to investigate and establish an average were the Spaniards. Out of 53,600 about 67 per cent. had a fair intelligence, 10 per cent. were below the average, and 18 per cent. were depraved mentally; less than 1 per cent. possessed hardly any intelligence, and 2 1/2 per cent. could not be classified.

"Lombroso gives the following table as to education:

	Delinquents. (507)	Normals. (100.)
	Per Cent.	Per Cent.
1. Analphabets.....	12	6
2. Elementary instruction..	95	69
3. Superior instruction.....	12	27

"Here 507 criminals are compared with 100 normal men. The criminals are much below the normals in the two extremes, but not in the elementary instruction.

"In Austria the lowest per cent. of crime (0.83 to 0.71

per cent.) for 14 years was found to be among those engaged in scientific work.

"With poets and artists crime is more frequent; they are dominated more by passion than those engaged in severe inductions or deductions.

"Criminality is more frequent among the liberal professions. In Italy 6.1 per cent. of criminals have superior education; in France, 6.0 per cent.; in Austria, from 3.6 to 3.11 per cent.; in Bavaria, 4.0 per cent. The proportion is here relatively greater than in the other classes of society; it is easy for the physician to give poison, the lawyer to cause perjury to be committed, and the teacher rape. Illiteracy is extremely common among prostitutes.

"As compared with the insane; criminals are much more lazy; but what they do has more purpose. Education tends to diminish monomania, religious and epidemical insanity, insanity of murder, and it gives to crime a less violent and less base appearance."

Concerning the power of contagion upon criminals, Dr. MacDonald says:

"Indirect contagion is as certain as the direct. Aubry gives several cases in illustration:

"A woman of Geneva, Switzerland, in 1885, killed her four children, then tried to commit suicide. In her autobiography were these words: 'As a woman did it, which was in the newspaper.'

"In 1881 a lad of 15 years stole from his patron; when the money was spent he found a child and stabbed it in the abdomen, and as he cut its throat he said: 'I have often read novels, and in one of them I found the description of a scene parallel to this which I have executed.'"

Concerning criminal hypnotism, see HYPNOTISM.

As a result of the study of the criminal, criminologists come to the conclusions as to the treatment of criminals stated in the articles CRIMINOLOGY and PENOLOGY. Dr. MacDonald summarizes them thus:

1. It is detrimental financially, as well as socially and morally, to release prisoners when there is probability of their returning to crime; for in this case the convict is less expensive than the ex-convict.

Summary.

2. The determinate sentence permits many prisoners to be released who are morally certain to return to crime. The indeterminate sentence is the best method of affording the prisoner an opportunity to reform without exposing society to unnecessary dangers.

3. The ground for the imprisonment of the criminal is, first of all, *because he is dangerous to society*. This principle avoids the uncertainty that may rest upon the decision as to the degree of freedom; for upon this last principle some of the most brutal crimes would receive a light punishment.

4. The publication in the newspapers of criminal details and photographs is a positive evil to society on account of the law of imitation; and, in addition, it makes the criminal proud of his record, and develops the morbid curiosity of the people. And it is especially the mentally and morally weak who are affected.

5. It is admitted by some of the most intelligent criminals, and by prison officers in general, that the criminal is a fool; for he is opposing himself to the best, the largest, and the strongest portion of society, and is almost sure to fail.

He adds: "If, as Lombroso thinks, crime is a return to the primitive and barbarous state of our ancestors, the criminal being a savage born into modern civilization, then for such there is

little hope of reformation. But these are criminals by nature and constitute a very small proportion, less than one tenth. The French school of criminology has shown that the greater part of crime arises out of social conditions, and hence is amenable to reformation, by the changing of these conditions.

Results.

Buechner says that defect of intelligence, poverty, and want of education are the three great factors in crime. Major McClaughry, of wide prison experience, and chief of the Chicago police, considers criminal parentage and associations, and neglect of children by their parents, as first among the causes of the criminal class. D'Oliverona, author of a French work on habitual criminality, asserts that three fourths of those who enter prison have been conducted to crime from the results of a neglected education.

"Now, education, in the narrow sense of mere intellectual instruction, is not sufficient to reform children who spend one fourth of the day in school, and three fourths on the street or with criminal, drunken, or idle parents. But are there not reform schools? Yes; but no provision has been made for the little children.

"One of the principal facts brought out at the late National Prison Congress at Baltimore was that all prisons should be reformatories. All men, no matter how old in crime, can at least be improved and benefited; that is to say, the best prisons of the future will be *reformatory* prisons, and the main means of reform will be the inculcation of good mental, moral, physical, and industrial habits—in other words, *education*."

Says Mr. Boies: "Permanent seclusion for the natural and incorrigible criminal, and indeterminate sentence to a reform school or reformatory for first and second convictions, except for the most heinous crimes, and special, permanent wardens for all jails, with complete reform of management, are the three vitally essential requirements of modern penology in America."

CRIMINOLOGY is the science which treats of the nature, causes, growth, and prevention of crime, together with the nature, punishment, and reformation of the criminal. Criminal anthropology is that portion of criminology which treats of the nature of the criminal, and penology that portion which treats of his punishment and reformation. We shall, therefore, treat these subjects under their respective heads. (See CRIMINAL ANTHROPOLOGY and PENOLOGY.) The statistics and character of crime we study under CRIME. In this article we consider, I. The Development of the Science of Criminology; II. The Causes of Crime; III. The Prevention of Crime.

I. THE SCIENCE.

Criminology is a comparatively new science. Penology in a way has been studied as long as human punishments have been inflicted, and

from the classic times there has been more or less thought and written as to the nature of crime; yet only recently has crime been studied in a scientific manner, with deduction and induction from carefully observed facts. The father of modern criminology is Professor Cesare Lombroso, of Turin, whose epoch-making work, *L'uomo delinquente*, appearing in 1876, may be said to have almost created the science. Since then the study of the science has been general, yet Italy still leads. Says Dr. Arthur MacDonald, in his *Abnormal Man*, published in 1893 by the United States Bureau of Education:

"In 1885 the first international congress [for the consideration of criminology] was held at Rome. The second congress met at Paris. At first the scientific study of criminology was looked upon with suspicion. At present interest in the subject is greatly increasing. Like every new science, it is in its polemical stage. The Italians are the innovators. The criminologists are divided into two parties: one emphasizes the pathological or atavistic causes; the other, the psychological and sociological. The latter are subdivided into socialists, who would account for everything by the inequality of economic conditions, and those who take into consideration all social phenomena.

"Criminology proper may be divided into general, special, and practical. General criminology consists in a summary and synthesis of all the facts known. Special criminology concerns the investigation of individual cases, physically, psychically, and historically considered. Here, perhaps, is the most promising field for the advancement of criminology as a science. The practical side, which includes all methods and institutions for the prevention or repression of crime, is the most familiar to the public.

"The subdivisions of criminal anthropology or criminology and its relations to other sciences might be indicated as follows:

"Criminal *vegetology* considers the analogies of crime in the vegetable and animal kingdoms. The *anatomy* of criminology includes more especially the craniology, cerebology, histology, anthropometry and physiognomy of the criminal. In criminal *psychology* one

Subdivisions.

would study the entire *psychical* life: intelligence, sentiments, sensibility, ethics, esthetics, and religion. Criminal *sociology* comprehends the association of criminals; their relation to the State; economically, and in connection with poverty and misery. Criminal *jurisprudence* takes into consideration all criminal laws and their underlying principles. *Penology* treats of the principles, degrees, and methods of punishment. *Statistical* criminology has for its object the arrangement, classification, and summary of all criminal data, and their interpretation. Criminal *hypnology* concerns those hypnotic and partially hypnotic conditions in which crime is committed, especially in the case of hysterical individuals. Criminal *epidemiology* considers those conditions where, through imitation or by a sort of contagion, crime suddenly develops. Criminal *teratology* treats of pathological sexuality, onanism, pederasty, sodomy, masochism and sadism, and sapphism. Criminal *prophylaxy* considers the methods of prevention through alterations of social condition, physical, intellectual, moral, and religious education; by means of prisons, transportation, and deportation. The *philosophy* of criminology takes up the more disputed questions and theories, as atavism, infantilism (natural depravity of children), degeneracy, the interpretation of psychical and physical characteristics, and crimo-psychiatrical cases. We may add that the whole study of pathological humanity may do for humanity what pathology has done for medicine."

Prominent among criminologists are, besides Lombroso, the Italians, Beccaria, Ferri, Garofolo, Rossi, Tenchini; the Germans, Benedikt von Holder, Holtzendorf; the French, Drs. Aubry, Berillon, Bernheim, Corre, Joly, Laurent, Magnan, Tarde; the English and Americans, Brockway, Ellis, Falkner, MacDonald, Morrison, Rylands, E. C. and F. H. Wines. To show the present development of the science, we quote the following report of the In-

ternational Congress for Criminal Anthropology in Brussels in 1892, as written by Dr. MacDonald in his *Abnormal Man*. He says:

"Dimitri Drill, publicist at Moscow, in his report as to the fundamental principles of criminal anthropology or criminology, traced the origin of the school to Gall, its grandfather, and to 'Lombroso, the father and founder.' In speaking of the Italian school, he acknowledged the great merits of Lombroso, but could not follow him in all his opinions. His résumé of the principles and tendencies of the school of criminal anthropology is as follows:

"1. Criminology renounces entirely the law of retaliation as end, principal, or basis of all judicial punishment. The basis and purpose of punishment is the necessity of protecting society against the sad consequences of crime, either by moral reclamation of the criminal or by his separation from society; punishment is not to satisfy vengeance.

"2. In criminology it is not sufficient to study the fact of crime; the criminal himself must be considered; it becomes necessary to define the causes which produce crime, to study the sphere of action of the criminal as well as measures for the safety of society against his acts. Criminology does not study the criminal in the abstract and speculate over his guilt or responsibility; but it analyzes him according to results purely scientific, and with the aid of exact methods which apply equally to the investigation of other phenomena.

"3. In crime the results of two factors are seen reciprocally reacting: first, the individual peculiarities from the nature of the criminal or his psycho-physical organization, then the peculiarities of external influences, as climate, nature of country, and social surroundings.

"4. Relying upon exact results, criminology reveals the criminal as an organization more or less unfortunate, vicious, impoverished, ill-balanced, defective, and so not adapted to struggle with surrounding conditions, and consequently incapable of maintaining this struggle in legally established ways. This defect of adaptation for the majority is not absolute, but varies with the conditions.

"5. The causes of crime fall into three categories: (a) immediate, which arise from the character of the criminal; (b) more remote, which are hidden in his unfavorable surroundings, under the influence of which organic peculiarities are developed into more or less constant criminal agents; (c) predisposing causes, which push these ill-proportioned and viciously developed organizations toward crime.

"6. Thus basing crime upon scientific grounds, criminology has as its purpose a fundamental study of the actual criminal and his crimes as ordinary phenomena which it must investigate throughout their whole extent, from their genesis to their full growth and final development. Thus the phenomenon of crime is united with great social questions.

"7. Based upon these principles, criminology logically recognizes an absence of good sense in repressive measures determined *in advance* as to their duration and specific character. Criminology, on the contrary, affirms the necessity of studying individual peculiarities, before rendering decisions in advance. The term of punishment should endure so long as the causes exist which necessitate it; it should cease as soon as the causes do.

"Manouvrier, who is professor in the anthropological school at Paris, and the well-known opponent of Lombroso's criminal type, in his paper on the comparative study of criminals and normal men, did not find any real distinctive differences except in surrounding conditions, which modify the associations or combinations of habitudes and correlatively the anatomical confirmation.

"Dr. Lacassagne, professor at Lyons, in discussing the primordial sentiments of criminals, distinguished three classes: The frontals (intellectual), the parietals or impulsive class, and the occipitals or the emotional class; the brain is an agglomeration of instincts which at a given moment can have a special function, and it is the preponderance of one of these instincts which can control the whole situation; this explains the want of reflection and of prudence in criminals; cerebral equilibrium, on the contrary, indicates virtue. The occipital instincts are in close relations with the viscera, and so with nutrition; hence the importance of these as social factors. This indicates that in the future it may be necessary to found the theory of criminality upon cerebral function.

Various Views.

"One of the most important papers in the Congress was that on 'Morbid Criminal Possession' by Dr. Magnan, physician and superintendent of the Ste. Anne Insane Asylum at Paris. Such a morbid possession consists generally of an idea isolated and independent of the ordinary course of thought; it is a mode of activity in the brain, in which a word or image imposes itself upon the mind, apart from the volition; in the normal state this idea or possession gives no special uneasiness, but in an abnormal person it can produce a painful agony and become irresistible. In the normal state the possession is transitory and generally easy to repress, and does not involve the other intellectual operations. But in an abnormal or diseased subject the individual can be irresistibly pushed to acts which he consciously disapproves of. Owing to a want of knowledge of such states, judicial and medical errors have not been infrequent. Thus a person pushed by the possession of the irresistible idea to murder (generally a cherished friend), altho horrified by the thought, commits the act. One of Magnan's patients, when having a premonition of the impulsion coming on, would shut herself up in a room until relieved.

Morbid Possession.

"According to Dr. Ladame, professor at Geneva, an individual possessed with the idea of murder belongs to the group of hereditary mental degenerates; such individuals are rare. If it be admitted that this morbid possession is frequent, on the other hand it rarely pushes to homicide, but is turned toward the individual himself, resulting in suicide. Dr. Ladame maintains that heredity is the main predisposing cause, but an occasional cause is also necessary, and this is principally in the publication of details in great crimes. An acquired predisposition is due to alcoholism. It is necessary to distinguish between insane murderers and those pushed to murder by morbid possessions. The latter belong to the large category of those affected by hereditary insanity, as dipsomania, kleptomania, etc. The possession of the idea of murder is sporadic, but is more frequently found under the form of a moral epidemic, resulting from the widespread knowledge of great crimes and from capital executions.

"No question stirred up more discussion than criminal suggestion. While distinguished men were frankly agnostic as to conclusions of their colleagues, yet it may be said that those who have made the most experiments on both normal and abnormal subjects are convinced that criminal suggestion and hypnotism can be produced experimentally, and actually do occur in society.

"Dr. Voisin, physician at La Salpêtrière, who is especially qualified to speak in regard to hypnotism, especially as to its therapeutical value, maintained that criminal suggestibility in the waking or hypnotic state is intimately connected with debility or mental degeneracy of the individual to whom the suggestion is given. There is a small number capable of committing criminal acts upon the example of degenerated impulsive individuals. The penal responsibility of an individual having committed a crime under the influence of hypnotic suggestion should be declared null, conforming to the French penal code (article 64), which says: 'There is neither crime nor misdemeanor, if the accused was in a state of dementia at the time of the act, or if he has been constrained by a force which he could not resist.' As to its therapeutical value, hypnotism in the hands of a physician can give admirable results. It can also save from crime and from the condemnation of the innocent, as well as from disease.

"Dr. Bérillon, editor of the *Revue de l'Hypnotisme*, as a result of his own investigations and experiments in criminal suggestion, believes he is justified in concluding that certain individuals present in the waking state such a suggestibility that it would be possible to make them execute automatically and unconsciously, when under the influence of verbal suggestion, misdemeanors or crimes. If it is shown that the accused acted under such suggestions, he should not be held responsible. On the other hand, authors of criminal suggestions should be held guilty in the same way as those who by abuse of authority or power or by machinations provoked the accomplishment of a crime or misdemeanor, or simply give instructions to commit it (French penal code, article 60).

"Neither Professor Benedikt, of Vienna, nor Professor Mendel, of Berlin, believe in the existence of crime by suggestion. Dr. Masoin, professor at Louvain, answered that negations cannot prevail in the presence of facts. Voisin insisted again on his opinion, since by hypnotism he had saved from condemnation

a woman, to whom a crime had been suggested. Dr. Houzé, professor of anthropology at Brussels, believed that hysteria could be cured by hypnotism, and that certainly it could be ameliorated; he believed also in the reality of criminal suggestion.

"Judge Tarde, of Sarlat, in France, well known as the author of *The Laws of Imitation* and of *Social and Penal Philosophy*, gave with his usual analytical finesse a curious and paradoxical discourse on the *Crimes of Crowds*. Morally and intellectually men in throngs are less valuable than in detail, that is, social collectivity, especially when it takes the form of a crowd, is morally inferior to the average individual in the crowd; thus a nation is not as moral as its normal 'citizen' type; the public are not as moral as the individuals which compose it. The collective spirit, which we call parliament or congress, is not equal in rapid or sure power of functioning, or in profoundness or amplitude of deliberation, to the spirit of the most mediocre of its members, whence the proverb: *Senatores bonivici, senatus autem mala bestia*. Even a liberal sect will become intolerant and despotic; a crowd still more so; in both cases despotism in any event is much more intolerant and despotic than among a majority of the members. Why? Because the contiguity and concentration of opinions are molded into conviction and faith, which became fanatical; that which was a simple desire in the individual becomes a passion in the crowd. The crowd is a retrograde social organism; no matter how perfect, it is passionate, not rational. The more collective a crime the less it is punished. The best police force cannot suppress the brutality of the crowd, unless the press cease to publish that which produces excitation to crime or misdemeanor. The jury will not punish such crimes, especially when they have a political color. Thus the necessity of an exclusive criminal magistrature is shown. The punishment should be, above all, as an example. The individual should be punished in the measure that his impunity is dangerous.

"Dr. Coutagne, medical expert at Lyons, in his paper on the influence of the profession on criminality, advocated the increase of penalty where the nature of the profession aggravates the crime, as in the case of abortion by physicians. Following the principle of social necessity, the penalties for the use of injurious substances in food, defamation of character by journalists, etc., should be increased.

"The respective importance of anthropological and social elements in the determination of penalty was considered by Dr. Gaucler; he showed that the essential function of criminal law is to prevent crime by intimidation, and that this function is conditioned exclusively by social elements; a secondary function is to be assured as to the 'innocuity' of a first offender, and also in some degree to repair the prejudice from which a victim suffers.

"Professor Von Liszt, of the University of Halle, in considering the applications of criminal anthropology, said that the most important one is subordination to criminal sociology. The profound difference between criminals by nature and by occasion is a result that can be immediately applied to legislation. Among the delinquents by nature are found a large number of degenerated individuals especially marked by heredity. Punition must seek to combat and ameliorate the criminal by degeneracy; if the criminal is young, the most preferable measures are those of education. Whether the criminal is incurable or not, society must be protected against him and he must be protected against himself.

"Professor Benedikt submitted the following resolution, that anthropological and biological studies are indispensable for the placing of penal legislation upon solid foundations.

"Professor Van Hamel, of Amsterdam, in his report on measures applicable to the incorrigible, concluded that the principal indication of incorrigibility is recidivation; against recidivists penalty should assume the character of social defense, on account of the danger; there should be indeterminate detention for the incorrigible; there should be periodic deliberations as to such cases, and a large latitude left to competent authority, which should be judiciary.

"In treating of the same question, Professor Alimena held to the idea of long and increased imprisonment proportionate to the number of crimes; and for those guilty of small misdemeanors, especially with recidivists, an abolition of short terms of punishment, and a substitution of obligatory labor in special institutions, in companies for work and in interior colonization. There should be perpetual relegation or deportation

Criminal Sociology.

for criminals who have passed the maximum of re-education.

"Professor Thiry, of Liège, held to the word incorrigible in the relative sense; for him the basis of incorrigibility is the permanent moral influence to which the individual succumbs; he did not believe in perpetual, but in indeterminate, detention; there was also no necessity for judiciary intervention to prolong or interfere with the detention, as administrative responsibility and the supervision already in use were sufficient to prevent arbitrary action.

"Dr. Maus formulated his conclusions as follows: The measures to be taken in regard to hardened recidivists should be, first, those that are best known; to send into the prison asylums those whose recidivation has a pathological cause; to increase considerably and in a gradual manner the duration of the punishment until it becomes perpetual for

Recidivists. the serious crimes; finally to render repression more subjective by applying it with a view to reformation, according to the state of the criminal and the nature of the crime. Such a difficult task requires not only specialists with experience and knowledge of insanity, but perhaps it cannot be accomplished without the aid of sincere devotion and sacrifice. Prevention also plays a rôle in combatting the social causes of recidivation, as degeneracy, alcoholism, prostitution, misery, etc.; these factors render vain in great part the efforts of the penitentiary, producing more recidivists than the penitentiary can correct.

"Professor Prins, of Brussels, who is the general inspector of prisons, placed the indeterminate sentence under two heads: delinquency for misery and for degeneracy; but in regard to repression proper, he saw great practical difficulties for those who are incorrigible and criminal by passion. As to the liberation of the incorrigible, relatively speaking, the appreciation of a judge or administrator is not sufficient guarantee. The solution of the question of the incorrigible lies in a progressive aggravation of punishment; and it is especially necessary to renounce prison luxury.

"Dr. Paul Garnier, chief physician of the 'Préfecture de Police' of Paris, in considering the necessity of a psycho-moral examination of certain accused persons as a duty of the court, said, if it is deemed excessive to ask judicial authorities to organize a medical inspection for the accused—which does not take the place of the medico-legal expert, but designates to him the cases to be inquired into—it is nevertheless a necessity in presence of frequent judicial errors. A magistrate entrusted with so delicate a mission as to decide whether a medico-legal expert is needed should at least possess certain indispensable notions of a scientific order to make such a decision. If the judge orders experts, he should be able to judge of their utility and to control the results through special knowledge; but such special knowledge necessary for the interpretation of scientific facts is outside the domain of a magistrate, however brilliant and judicious he may be."

As to the principles of the science, different schools would, of course, state them differently. Dr. MacDonald, in his report, states them thus:

"The relation of criminality to the other forms of pathological and abnormal humanity is one of degree. If we represent the highest degree, as crime, by A⁶, A⁵, say, would stand for insane criminality, and A⁴ for alcoholism, perhaps, A³ for pauperism, A² for those weak forms of humanity that charity treats more especially, and A for the idea of wrong in general, particularly in its lightest forms. Thus, crime is the most exaggerated form of wrong; but these forms are all one in essence. A drop of water is as much water as is an ocean.

"It is difficult to draw a distinct line between these different forms of wrong. This will become evident from the fact that they are dovetailed one into the other. Thus, when cross-questioning criminals, one often feels that not only are their minds weak and wavering, but that they border close on insanity. The same feeling arises after an examination of confirmed paupers. Here alcoholism is one of the main causes; the individual, on account of his intemperate habits, finds difficulty in obtaining employment, and this forced idleness gradually, from repetition, develops into a confirmed habit. Pauperism may be, in some cases, hereditary, but it is too often overlooked that the children of paupers can acquire all such habits from their parents, and so it can be carried from one generation to another, without resorting to heredity as a cause, which is too often a name to cover up our ignorance of all the early conditions. The extent to which

alcoholism is involved in all forms of humanitarian pathology is well known; it is often indirectly as well as directly the cause of leading the young into crime; the intemperate father makes himself a pest in his own home; the children remain out all night through fear; this habit leads to running away for a longer time. Altho not thieves, the children are compelled to steal or to beg, in order to live; and thus many become confirmed criminals or paupers, or both. The great evil about alcoholism is that it too often injures those around, who are of much more value than the alcoholic himself. It makes itself felt indirectly and directly in our hospitals, insane asylums, orphan asylums, and charitable institutions in general. However low the trade of the prostitute may be, alcohol is her greatest physical enemy.

"As just indicated, some of the lesser degrees of abnormal and pathological humanity may be considered under the head of charitable. These are represented by the different kinds of benevolent institutions, such as asylums for the insane and feeble-minded, for the inebriate; hospitals, homes for the deaf, dumb, and blind, for the aged and orphans, etc.; and institutions for defectives of whatever nature.

"It is evident, however, that the term charitable may not only be applied to what is pathological or abnormal, but also to that which is physiological or normal. Thus it can refer to institutions of quite a different order, but yet none the less charitable in nature. We refer, of course, to educational institutions, the majority of which are a gift to the public, and especially to those who attend them. It is obvious enough that every student is, in some measure, a charity student from the well-known fact that the tuition money in most cases pays a very small part of the expenses.

"Now, no distinct line can be drawn between penal and reformatory institutions, and between reformatory and educational institutions; it is, again, a question of degree. But, in saying this, it is not meant that difference in degree is of little consequence. On the contrary, it is very important to distinguish between penal, reformatory, and educational for practical reasons, as in the classification of prisoners, not all of whom are criminals. In a sense, all education should be reformatory.

"But, it may be asked, where can a subject end? It goes without saying that divisions are more or less arbitrary, if we are seeking reality, for things are together, and the more we look into the world the more we find it to be an *organic mechanism of absolute relativity.*

Principles.

Most human beings who are abnormal or defective in any way are much more alike than unlike normal individuals; and hence, in the thorough study of any single individual (microcosmic mechanism), distinct lines are more for convenience. Thus the difficulties of distinguishing between health and disease, sanity and insanity, vegetable and animal, are familiar. Whatever may be said from the educational point of view about abnormal cases is generally true, with few modifications, of the normal. Education and pedagogy are thus to be included to some extent in a comprehensive charitable system.

"But altho the distinct separation of one wrong from another is not easy, yet the decision as to the highest form of wrong may not be so difficult. This form consists, without doubt, in the act of depriving another of his existence; no act could be more radical; the least that could be said of any one is that he does not exist. The desire for existence is the deepest instinct in nature; not only in the lower forms of nature, but anthropologically considered, this feeling manifests itself in the highest aspirations of races. In mythology, religion, and theology the great fact is existence hereafter, and in philosophy it has gone so far as preexistence of the soul. Perhaps the deepest experience we have of non-existence is in the loss of an intimate friend, when we say so truly that part of our existence has gone from us. It is death which makes existence tragic.

"Now, the degrees of wrong may be expressed in a general way in terms of existence; that is, in depriving another of any of his rights we are taking from him some of his existence, for existence is qualitative as well as temporal; that is, it includes everything that gives to life content.

"Thus, in this sense, a man of 40 may have had more existence than another at 80, where the former's life has been broader, richer in experience and thought, and more valuable to others.

"We may say in general that the existence of a person is beneficial or injurious in that degree in which it is beneficial or injurious to the community or human-

ity. This statement is based upon the truism that the whole is more than any of its parts.

"The degrees of wrong, therefore, should depend upon the degree of danger or injury (moral, intellectual, physical, or financial) which a thought, feeling, willing, or action brings to the community."

This same principle should be applied to degrees of exaggerated wrong or crime.

"But it may be said, should not the degree of freedom or of personal guilt be the main basis for the punishment of the criminal? The force of this objection is evident; historically, the idea of freedom has been the basis of criminal law; it has also been sanctioned by the experience of the race; and altho no claim is made of carrying it into practice without serious difficulties in the way of strict justice (difficulties inevitable to any system), yet it has not only been an invaluable service, but a necessity to humanity. This is not only true on criminal lines, but this idea has been the conscious basis of our highest moral ideas.

"But at the same time it must be admitted that the exaggeration of the idea of freedom has been one of the main causes of vengeance, which has left its traces in blood, fire, martyrdom, and dungeon; and tho at present vengeance seldom takes such extreme forms, yet it is far from extinct. On moral and on biblical grounds, as far as human beings are concerned, vengeance can find little support; an example of its impracticability is the fact that some of the best prison wardens never punish a man until some time after the offense, so that there may be no feeling on the part of either that it is an expression of vengeance. The offender is generally reasoned with kindly, but firmly, and told that he must be punished, otherwise the good discipline of the prison could not be maintained, which means that he is punished for the good of others. With few exceptions, a revengeful tone of manner toward the prisoner (the same is true outside of prison) always does harm, for it stirs up similar feelings in the prisoner, which are often the cause of his bad behavior and crime, and need no development. Kindness with firmness is the desirable combination. Vengeance produces vengeance.

"But, taking the deterministic view of the world, the highest morality is possible. One proof is that some fatalists are rigidly moral. A psychological analysis will show that persons who are loved and esteemed are those whose very nature is to do good—that is, they would not and could not see a fellow-being suffer; that is, from the necessity of their nature, they were from infancy of a kind disposition. We admire the sturdy nature who, by long struggle, has reached the moral goal; but we cannot love him always. He is not always of a kind disposition; this is not a necessity of his nature. As the expression goes, 'There are very good people with whom the Lord Himself could not live.'

"Is it not the spontaneity of a kind act that gives it its beauty, where there is no calculating, no reasoning, no weighing in the balance, no choice? The grace of morality is 'in its naturalness. But go still further. Do we like a good apple more and a bad apple less because they are necessarily good or bad? And if we admitted that every thought, feeling, willing, and acting of men were as necessary as the law of gravity, would we like honest men less and liars more? True, we might at first modify our estimation of some men, but it would be in the direction of better feeling toward all men.

"But, whatever one's personal convictions may be, questions of the freedom of the will and the like must be set aside, not because they are not important, but simply because enough is not known regarding the exact conditions (psychological and physiological) under which we act and think. If we were obliged to withhold action in the case of any criminal for the reason that we did not know whether the will is free or not (allowing for all misconceptions as to this whole question), the community would be wholly unprotected. If a tiger were loose in the streets, the first question would not be whether he was guilty or not. We should imprison the criminal, first of all, because he is dangerous to the community.

"But if it be asked, how there can be responsibility without freedom? the answer is that there is at least the feeling of responsibility in cases where there is little or no freedom; that is, there is sometimes no proportion between the feeling of responsibility and the amount of responsibility afterward shown. The main difficulty, however, is that in our present state of knowledge it is impossible to know whether this very feeling of responsibility or of freedom is not

itself necessarily caused either psychologically or physiologically or both. If we admit that we are compelled to believe we are free (as some determinists seem to claim), we deny freedom in this very statement. Another obvious and practical ground for our ignorance as to this point is the fact that, altho our generations as the best and greatest minds have not failed to give it their attention, yet up to the present time the question remains *sub judice*. If we carried out practically the theory of freedom, we should have to punish some of the greatest criminals the least, since, from their coarse organization and lack of moral sense, their responsibility would be very small.

"There is no objection to speaking of freedom in the sense that a man as an individual may be free in regard to his surroundings and can influence those around him, as is the case in strong characters which can be independent of their outward environment, and so act freely. But to say that within the man himself, within his character or personality (body and mind), there is freedom, is going entirely beyond our knowledge, for there is little or nothing demonstrated concerning the workings or relations of brain and mind.

"Dr. Paul Carus well expresses a similar idea when he says: 'A free man, let us say an artist, full of an idea, executes his work without any compulsion; he works of his own free will. His actions are determined by a motive of his own, not by foreign pressure. Therefore, we call him free.'

"A scientific ethics must regard the question of freedom as an unsettled problem. Any ethics would be unethical in taking as one of its bases so debatable a question.

"Our general, sociological, ethical principle (as above stated) is that the idea of wrong depends upon the moral, intellectual, physical, and financial danger or injury which a thought, feeling, willing, or acting brings to humanity.

"But, accepting this principle, the important question is, just what are these thoughts, feelings, willings, and actions, and by what method are they to be determined? The first part of this question, on account of the narrow and limited knowledge at present in those lines, can be answered only very imperfectly, if at all. As to the method, that of science seems to us the only one that can eventually be satisfactory. By the application of the scientific method is meant that all facts, especially psychological (sociological, historical, etc.), physiological, and pathological, must form the basis of investigation. Psychological facts that can be scientifically determined, as affecting humanity, beneficially or not, are comparatively few in number. Physiologically, more facts can be determined as to their effect on humanity. But it is preeminently in the field of pathology that definite scientific results can be acquired. As to the difficulty of investigating psycho-ethical effects, it may be said physiological psychology and psycho-physics have not as yet furnished a sufficient number of scientific facts.

"By the scientific application of chemistry, clinical and experimental medicine, with vivisection, to physiology, many truths of ethical importance to humanity are made known. But there is much here to be desired; for example, what is said about questions of diet and ways of living in general is scientifically far from satisfactory. The development of pathology in medicine has been without precedent. Its direct ethical value to humanity is already very great; but the outlook into the future is still greater. It is only necessary to mention the discovery of the cholera and tuberculosis germs (a *conditio sine qua non* of their prevention), immunity in the case of the latter would be one of the greatest benefactions yet known to the race. Medicine can be said to be the study of the future, especially in the scientific and prophylactic sense. It is to experimental medicine that scientific ethics will look for many of its basal facts.

"In emphasizing the scientific method as the most important it is not intended to exclude others. The *a priori* method has been of inestimable value to philosophy, ethics, and theology, and to science itself in the forming of hypotheses and theories, which are often necessary anticipations of truth, to be verified afterward. The *a priori* method is related to the *posteriori* method as the sails to the ballast of the boat: the more philosophy, the better, provided there are a sufficient number of facts; otherwise there is danger of upsetting the craft.

"The present office of ethics is, as far as the facts will allow, to suggest methods of conduct to follow and ideals to hold that will bring humanity into a more moral, physiological, and normal state, enabling each individual to live more in harmony with nature's laws. Such an applied ethics must study especially the

Reason for Imprison- ment.

phenomena manifested in the different forms of pathological humanity and draw its conclusions from the facts just gathered.

"But there are many scientists who look with suspicion upon the introduction of philosophical thought and methods into their field. We may call them pure scientists; that is to say, those who believe that the

Responsible-ity.

term scientific truth should be applied only to that form of truth which can be directly verified by facts accessible to all. Yet from this point of view the arrangement, classification, formation of hypotheses and theories, or philosophical conclusions are not necessarily illegitimate, provided those processes are clearly distinguished from each other and rigidly separated from the facts. Perhaps the study which, more than all others, will contribute toward a scientific ethics is criminology, the subject-matter of which touches the popular mind very closely, owing, in a great measure, to the influence of the press; and tho this has its dangers, yet it is the duty of this, as of every science, to make its principles and conclusions as clear as possible to the public, since in the end such questions vitally concern them.

"Crime can be said, in a certain sense, to be nature's experiment on humanity. If a nerve of a normal organism is cut, the organs in which irregularities are produced are those which the nerve controls. In this way the office of a nerve in the normal state may be discovered. The criminal is, so to speak, the severed nerve of society, and the study of him is a practical way (tho indirect) of studying normal men. And since the criminal is seven eighths like other men, such a study is, in addition, a direct inquiry into normal humanity.

"The relation also of criminology to society and to sociological questions is already intimate, and may in the future become closer. Just what crime is at present depends more upon time, location, race, country, nationality, and even the State in which one resides. But notwithstanding the extreme relativity of the idea of crime, there are some things in our present social life that are questionable. A young girl of independence, but near poverty, tries to earn her own living at \$3 a week, and if, having natural desires for a few comforts and some taste for her personal appearance, she finally, through pressure, oversteps the bound, society, which permits this condition of things, immediately ostracizes her. It borders on criminality that a widow works 15 hours a day in a room in which she lives, making trousers at 10 cents a pair, out of which she and her family must live, until they gradually run down toward death from want of sufficient nutrition, fresh air, and any comfort. It is criminally questionable to leave stoves in cars, so that if the passenger is not seriously injured, but only wedged in, he will have the additional chances of burning to death. It has been a general truth, and in some cases is still, that so many persons must perish by fire before private individuals will furnish fire escapes to protect their own patrons. It is a fact that over 5000 persons are killed yearly in the United States at railroad grade crossings, most of whose lives could have been spared had either the road or the railroad passed either one over the other. But it is said that such improvements would involve an enormous expense; that is practically to admit that the extra money required is of more consequence than the 5000 human lives. And yet, strange as it may seem, if a brutal murderer is to lose his life, and there is the

least doubt as to his premeditation, a large part of the community is often aroused into moral excitement, if not indignation, while the innocently murdered railroad passenger excites little more than a murmur.

"There is, perhaps, no subject upon which the public conscience is more tender than the treatment of the criminal.

"Psychologically, the explanation is simple, for the public have been educated gradually to feel the misfortune and sufferings of the criminal; it is also easier to realize, since the thought is confined generally to one personality at a time."

II. CAUSES OF CRIME.

Writers, of course, vary very considerably in their opinions as to the causes of crime.

At the Birmingham meeting of the (English) National Association for the Promotion of Social Science, held in 1868, the Rev. H. S. Elliot gave the following table as to the causes of crime, which he had compiled out of personal observation :

Bad company	351
Drink	205
Poverty	52
Opportunity	77
Want of principle	67
Temper	96
Immorality	39
Wantonness	11
Incapacity	102

Total..... 1,000

Mr. L. G. Rylands says, in his *Crime and its Causes*, from which we quote the above table (p. 46):

"To sum up, the active causes of all kinds are these: Defective training, or total absence of any; immoral associates and bad example in prison as well as out of it; drink, idleness, and the hereditary transmission of evil tendencies. These causes, however, frequently overlap, and one is often found to be the effect of another; the only perfectly simple and absolutely final division is into two main heads: Heredity and Environment."

Considering the separate items here mentioned, various writers have emphasized various causes. In his *Prisoners and Paupers*, Mr. H. M. Boies, member of the Pennsylvania Board of Public Charities, emphasizes the causes of evil surroundings and intemperance. He says that intemperance causes more than 75 per cent. of the crimes committed, while our cities furnish 90 per cent. of our criminals, and in support of which statement he presents the following table :

PERCENTAGE OF URBAN POPULATION AND CRIMINALS IN CERTAIN STATES.*

	Number of Cities.	Percentage of Urban Population to Total.	One Criminal to Every	Total Criminals.
The United States.....	345	27.6	786.5	79,617
Vermont.....	2	7.6	1605.	207
Maine.....	6	17.1	1031.	641

Pennsylvania.....	33	39.1	929.	5,659
Connecticut.....	10	41.8	454.	1,641
New Jersey.....	15	51.	489.	2,948
Rhode Island.....	4	57.6	556.	621
New York.....	32	57.8	455.	13,159
Massachusetts.....	37	66.	703.	3,182
District of Columbia.....	1	100.	548.	370

* Collated from the *Bulletin of the Eleventh Census.*

He shows the same by the following as to Pennsylvania :

"The county of Allegheny, where are the cities of Pittsburg and Allegheny, with a joint population of 343,440 out of 551,959 in the county, largely made up by

mining and manufacturing towns, supplies 20.3 of the criminal population of the same date, or one in 272.7 of its population. This is nearly three times the average of the State. Philadelphia furnishes about seven and a half times, and Allegheny nearly nine times as many criminals as the average of the rural counties.

"A similar condition exists in regard to pauperism."

COMPARATIVE STATISTICS OF PAUPERISM BY RURAL AND URBAN COUNTIES AND THE STATE OF PENNSYLVANIA.*

	State of Pennsylvania.	County of Philadelphia.	County of Allegheny.	Rural Counties.
Population.....	5,258,041	1,046,964	551,050	1,673,556

* Collated from the Report of the Board of Public Charities for 1890.

City life, with its crowded slums and tenements, he considers one great cause of crime. He says :

"Humanity crowded into cities divides itself into three distinct strata in their extreme divergence, altho so gradually merging together as to leave no positive line of demarcation between them. At the top of the social scale is the wealthy class, able to live without labor, and to indulge itself in the gratification of most of its desires. Next below is the middle class of workers, living in comfort without extreme luxury. At the bottom all the rest, the largest number of all; hustled and swirled in the fierce currents of life hither and thither; packed and crowded into such tenements as are left to them; mostly unable to procure or incapable of enjoying any but the baser sensual pleasures; mixed indiscriminately in their habitations, and everywhere with the most vicious of mankind, with everything to corrupt and but little to improve them.

"The influences of city life upon these three classes are different in nature and degree. The two upper are extensively reached by the conservative and elevating privileges of intellectual and religious culture and stimulation; the lower but slightly. Wealth and the power it confers tend to engender in the highest stratum a sense of independence of, and superiority over, the rules and regulations of human and divine law. Selfishness and indulgence weaken the moral sense and physical powers; the incessant pursuit of pleasure by individuals disturbs and disrupts family relations; domestic enjoyment is abandoned for the more exciting attractions of 'society,' and the family home becomes but little better than a hotel to sleep and eat in when not otherwise engaged.

As a consequence, marriage tends to become simply an arrangement of convenience like the home; children are committed to the training of hired nurses and tutors; parental responsibilities are ignored or neglected, and one by one the members of the highest class sink out of it, by loss of health, character, or wealth, and it makes its contribution to criminality or pauperism in due time from those ruined in it. The display of luxury and splendor by the wealthy also, doubtless, excites ambitions and desires among those who are unable to gratify them honestly, which leads to dishonesty and crime. The inability of many of the young who are in association with the wealthy to maintain the expense of a family in a style to which they are accustomed operates to discourage matrimony, and conduces to licentiousness and the increase of prostitution. It is commonly understood that social morals and religion are at their lowest ebb in the upper and nether strata of society the world over.

"The great intervening mass of citizens which con-

stitute the social leaven, ordained to save the whole lump, are exposed to grave dangers of a different nature in city life. They are subjected to temptations of the most attractive and insidious kinds. Vice clothes itself in its most alluring vesture in great cities. The most capable and skilful of the vicious and immoral naturally seek and find here their most fruitful field of operation, as well as opportunity to hide themselves amid the thronging thousands. Gorgeous saloons for gambling, drinking, and prostitution invite the unwary on all sides. 'Traps for the innocent are baited with every kind of 'entertainment;' names are invented to clothe wrong-doing in the garments of respectability, and the constant, necessary familiarity with the various forms of vice which abound leads the unwary first to 'endure, then pity, then embrace.' The density of population affords also opportunity for secret indulgence in sinful practices, without attracting attention. People live for years in houses whose doorsteps are only separated by an iron railing without knowing one another. Thousands spend their lives in 'flats,' with other families above and below them, others in hotels and boarding-houses. The husband and father is absent regularly every day at his business, the home deserted; Sunday, being the only day when the whole family is together, becomes a day of enjoyment and recreation; religion wanes and dies, and its restraints and elevating influences disappear.

"Worse than all, the children are compelled to play in the streets, and to associate with all they meet there; to learn all the evil known by the worst. Here they become familiar with every form of evil and sin. The curbstones and doorsteps of the respectable resident

Child Life.

portion of large cities, crowded with children on a pleasant evening, are often a painful sight to a philanthropist. Girls and boys of all ages and kinds, sporting promiscuously of necessity where every foul nighthawk seeks its prey, lose the lovely innocence of childhood before they reach their teens, and each generation of city growth takes a lower level in purity and morals as its average than the preceding. Parents, too, absorbed in the urgent competitions and activities of business and pleasure, become more and more prone to delegate the nurture and admonition of their children to the day-school and Sunday-school teacher--often to omit the latter entirely. Family training and duties grow lax as communal social requirements increase. As the divinely instituted responsibilities are ignored, the conservative and elevating influence of domestic life declines; so the community takes the place of the family.

"It is a threatening and dangerous change which substitutes public pleasures for private enjoyments, or a public for a private life in society, obliterating the home from the consciousness and recollections of a people.

"An inordinate eagerness to accumulate wealth is

inflamed in the ranks of the successful; a speculative spirit akin to gambling depraves honest business. . . .

"If the life of the upper classes of citizens conduces to degradation, what shall be said of the lower and lowest? What can be expected from the helpless and

Slums.

hopeless; the dregs of humanity, settled, out of the ferment of civilization in the cities? Their want and misery, immorality and vice, have reached bottom, and can descend no farther with life. The shocking and deplorable condition of the 'submerged' has been forcibly portrayed by General Booth of the Salvation Army and other recent writers. Whole families (14, even, were found in one room) huddled in single garret or cellar rooms, to feed together on garbage, and sleep together on rags and straw gathered on the streets; murderers, robbers, thieves, worn-out drunkards, and prostitutes crowding together in vile dens; establishing communities which the police scarcely dare enter after dark; filling single tenements with the population of a village; whole precincts living in actual if not open defiance of the law of God and man, of decency, of health, of honesty, social welfare, morals, and religion. Their numbers, constantly recruited by criminal fugitives from every direction, have no thought or study but to prey upon society, and to educate one another in the ingenuities of vice. Few, feeble, and futile are the efforts that are made to rescue or help or save them, and even these are received with a snarl like that with which the hunted street cur takes a morsel from the hand of pity.

"Amid such environments society is corrupted chiefly by the frightfully increasing vices of Sabbath desecration, intemperance, fornication, and gambling. To these debasing influences are to be attributed largely the shocking increase of pauperism and criminality from cities. These are the honor destroyers, the family disruptors, the youth corruptors, the corrodors of vitality, the obliterators of morality, the savage enemies of religion in cities. They all assail classes with equal virulence and assiduity. They are the common enemies of Christianity and humanity, grown already into such proportions and power in our cities as to threaten the public welfare and endanger the State. They have been ignored and tolerated or unwisely dealt with so long, that they have acquired a status and strength which displays its arrogance even in the organization of the government which should suppress them. They demand and often receive official protection, instead of police extinction. Public sentiment, even, is half disposed to recognize and accept their presence as an inevitable necessity. With a contempt bred of familiarity many question and doubt the possibility of their control or eradication, while their minions and votaries, with amazing audacity, assert and proclaim their immunity from interference. The burglar, the robber, and embezzler might, with equal propriety, make common cause with their pals, and claim a right to exercise, unchallenged, their nefarious professions.

"Another prolific source of crime and pauperism in cities is the gambling spirit which pervades all classes. From speculation in real property or in the paper tokens of property, such as stocks and bonds, and social card-playing for

Speculation.

money, down through the gilded gambling saloons, glittering with an almost regal splendor, and made attractive with almost every luxury of temptation to appetite; through the private poker-rooms of the hotels and liquor-saloons; through skillfully disguised lottery schemes; plain betting on competitions, on horse-races, on base-ball games; indeed on every undecided event, the desire and effort to acquire the property of another without labor, or without the rendering of a fair equivalent of value, seems to permeate and corrupt a constantly increasing proportion of city people. The inevitable losses which befall the losing half, and the hope of retrieving them where they were made, are the incitements to more frauds, embezzlements, misappropriations, robberies, and even thefts, than are the demands of actual want. . . .

"Another modern development of urban life contrary to nature and prejudicial to good morals is becoming recognizable in the multiplication of 'clubs' of all kinds. Some of these are useful as midday resorts for those engaged at a distance from home. Others are unobjectionable when formed for the promotion of a laudable object. But when they become substitutes for home, and are made to satisfy the desires and wants of young men apart by themselves, they deserve the condemnation and discouragement of every Christian, moralist, philanthropist, and patriot.

"The *New York City Directory* contains the names of 242 of such clubs as having sufficient prominence to warrant record there. Besides these, there are the unnumbered small coteries, unnamed or unknown beyond their immediate membership, which exist in all parts of the city. This lead of the metropolis is being followed to a greater or less extent in all important cities, and the tendency to club life appears to be growing. Inspired in the inception largely for the comfort and convenience of the unmarried young men abounding in the cities, by providing opportunity and temptation to indulgence of all kinds in comparative privacy, especially for convivial drinking and social gambling, they not only threaten the young there with the dangers of intemperance and gambling, but so ameliorate the loneliness and discomforts of bachelor life as to become an obstacle and hindrance to marriage. It is said that the sales of liquor in some of the most popular clubs in New York exceed those of any bar-room in the city."

It may be noted also that, according to Levasseur (vol. ii., p. 455), urban population in France has a criminality double that of the rural population; while, according to W. D. Morrison (*Mind*, vol. i., N. S., p. 512), London, with less than one fifth of the population of England and Wales, furnishes one third the indictable crimes.

Concerning intemperance as a cause of crime, Mr. Boies says:

"We have attributed the abnormal increase of criminality and pauperism in the United States largely to an increase of intemperance. Alcoholic drink is estimated to be the direct or indirect cause of 75 per cent. of all the crimes committed, and of at least 50 per cent. of all the sufferings endured on account of poverty, in this country and among civilized nations."

For a contrary opinion, see POVERTY, CAUSES OF.

Mr. Boies enforces his statement by the following quotations.

E. C. Wines, D.D., LL.D., President of the International Penitentiary Congress of Stockholm, author of *State of Prisons in the Civilized World*, etc., testifies:

"Intemperance is a proximate cause of a very large proportion of the crime committed in America. Fully three fourths of all the prisoners with whom I have personally conversed in different parts of the country admitted that they were addicted to an excessive use of alcoholic liquors. . . . In a circular letter which I once addressed to the wardens of all our State prisons, this question was put to them, among others: 'What is your opinion as to the connection of strong drink and crime?' The answers were all one way. Mr. Pollard, of Vermont, did but echo the general sentiment, tho he put it more sharply than most, when he said: 'My opinion is that if intoxicants were totally eradicated, the Vermont State Prison would hold all the criminals in the United States.'"

William Tallack, Secretary of the Howard Association, London, England, author of *Defects of Criminal Administration, Penological and Preventive Principles*, etc., testifies:

"It is unquestionable that, in most countries, the worst sufferings inflicted upon women, children, and dumb animals are perpetrated under the influence of intoxicating drink, for this is provocative of both cruelty and lust. . . . Most crimes must be and are attributable to intemperance. . . . What is the origin, in innumerable instances, of the wretchedness of those homes which it is a calamity for a child to be born into? It is intemperance. And what is the main source of that poverty which causes so many children to be either neglected or driven into evil courses? Again it is unquestionably intemperance."†

Ex-Chief-Justice Noah Davis, of the New York Supreme Court, testifies:

* *State of Prisons*, pp. 112, 113.

† *Penological Principles*, pp. 296, 380.

"Among all causes of crime, intemperance stands out the unapproachable chief. That habits of intemperance are the chief causes of crime, is the testimony of all judges of large experience.*"

Dr. Harris, of the Prison Association of New York, testifies :

"That fully 85 per cent. of all convicts give evidence of having in some larger degree been prepared or enticed to do criminal acts because of the physical and destructive effects upon the human organism of alcohol.†"

The State Board of Charities of Massachusetts, in their report of 1869, testify :

"The proportion of crime traceable to this great vice (intemperance) must be set down, as heretofore, at not less than four fifths."

Hon. Sanford M. Green, Judge of the Supreme and Circuit Courts of Michigan, testifies :

"That it (intemperance) is the parent of pauperism. That it is the chief cause of crime.‡"

John C. Park, District Attorney of Suffolk County, Mass., testifies :

"While district attorney I formed the opinion (and it is not a mere matter of opinion, but is confirmed by every hour of experience since) that ninety-nine hundredths of the crime in the commonwealth is produced by intoxicating liquors."

Mr. Fisk, in a report of the United States Commissioner of Education, 1871, testifies :

"At the Deer Island House of Industry, Boston, 88 per cent. of the committals were for drunkenness and 93 per cent. of the confinements were connected with strong drink."

Charles S. Hoyt, Secretary of the State Board of Charities of New York, testifies :

"After an examination made of the inmates of the various poorhouses of the State in 1875, numbering 12,614, that 84.36 per cent. of the males and 41.97 per cent. of the females were intemperate; and of 4047 insane examined, 79.21 of the males had been intemperate, and 21.44 per cent. of the females."

A few other minor causes may be mentioned. Mr. Forbes Winslow, Physician to the British Hospital, says, in his *Youthful Eccentricity a Precursor of Crime* (p. 85) :

"The great publicity given to the minutiae of atrocious crimes in the public press is undoubtedly a fruitful source of crime in this and other countries. The evil is a great and admitted one; the remedy has yet to be discovered which does not come under the accusation of interfering with the liberty rightly exercised in most matters by the press. There is always floating on the surface of society a numerous class of persons of questionable moral sense, ripe and ready for any kind of vice, eager to seize hold of any excuse for the commission of grave offenses against person and property. This class is generally more or less affected by the publication of the minute details of murder, suicide, and other crimes. They tend, as it were, to form the type of the moral epidemic, and to give form and character to the criminal propensities. Many years ago, Esquirol, a leading authority in lunacy, with many others of the period of which I write, complained bitterly, even then, of the effect of the public press in increasing the amount of maniacal crimes. This was at a time when newspapers were comparatively scarce, but since then, I regret to say, the tendency for the sensational has been gradually but surely increasing, to the damage and detriment of its youthful readers, ever eager to gloat over the description of a crime or an execution. The daily reports which appear in the press as to the

health, deportment, the general conduct of a notorious criminal, his behavior, quotations from his letters, scenes in prison, are surely the strongest inducements to many weak-minded persons to take the same means of acquiring notoriety by following in the steps of the criminal in question. . . .

"In dealing with the influence of the bar on the spread of crime, I allude to the impressive and eloquent addresses made for the defense in some sensational cases."

"The law of any land is that it allows no man's guilt until it is proven, and all are entitled to such defense as the law allows. But, being conscious of the fact, what a powerful incentive to crime is the love of notoriety! Let any one glance over the detailed, impassioned speeches of those learned in the law, pleading for their client's sake, the thrilling and soul-stirring perorations of those conscientiously pleading for very life, to save a fellow-creature from the gallows, and let him calmly consider whether to be thus spoken of would not be, to hundreds, a strong incentive to go and do likewise, in order to be thus exalted by such advocates at the bar."

Other causes for crime exist besides those of unhealthy city life and intemperance. Mr. Carroll D. Wright, in a paper published by the American Academy of Political and Social Science, says concerning the economic causes of crime :

"All great social questions, on careful analysis, resolve themselves, in a more or less degree, into some phase of what we call the labor question, and certainly the causes of crime, in a sociological sense, cannot be studied without considering the status of man in the prevailing industrial order, for among all the causes for criminal action, or for the existence of the criminal class, we find that economic conditions contribute in some degree to their existence. This, however, is only a phase of criminology. It is this phase which has been given me as a subject for discussion. . . .

"Guizot has said that labor is a most efficient guarantee against the revolutionary disposition of the poorer classes. He might have added that labor, properly remunerated, is an effective guarantee against the commission of crime. Certainly hunger leads to more crime of a petty nature, perhaps, than any other one cause."

"In the study of economic conditions, and whatever bearing they may have upon crime, I can do no better than to repeat, as a general idea, a statement made some years ago by Mr. Ira Steward, of Massachusetts, one of the leading labor reformers in that State in his day. He said: 'Starting in the labor problem from whatever point we may, we reach, as the ultimate cause of our industrial, social, moral, and material difficulties, the terrible fact of poverty. By poverty we mean something more than pauperism. The latter is a condition of entire dependence upon charity, while the former is a condition of want, of lack, of being without, the not necessarily a condition of complete dependence.'

"It is in this view that the proper understanding of the subject given me, in its comprehensiveness and the development of the principles which underlie it, means the consideration of the abolition of pauperism and the eradication of crime; and the definitions given by Mr. Steward carry with them all the elements of those great special inquiries embodied in the very existence of our vast charitable, penal, and reformatory institutions, 'How shall poverty be abolished, and crime be eradicated?' The discussion is a very old one, and neither modern professional labor reformers, nor philanthropists, nor criminologists, nor penologists have any patents upon the theme. The progress of the world may be read as well by statutes in the humanity of law, in the existence of prisons, in the establishment of charitable institutions, and by the economic conditions which surround labor, as by written history; for, as the condition of labor rises, pauperism and crime must fall in the general scale."

"To say that pauperism, and crime as an attendant evil, follow the unemployed more mercilessly than the employed, would be to make a statement too simple in its nature to invite serious consideration. Yet the history and the statistics of labor and the conclusions resulting from their study in their relation to pauperism and crime present most interesting and valuable features. Criminal conditions, the evils we are considering, have always existed, no matter what the so-

* Address before the National Temperance Society, 1878.

cial or legal status of men; under the most favorable as well as under the most unfavorable conditions; under liberal and under despotic government; in barbarous and in enlightened lands; with heathenism and with Christianity; under a variety of commercial systems; and yet they are, in a philosophic sense, a rebuke to a people living under constitutional liberty.

"Employment of the unemployed will not crush pauperism and crime, even if every able-bodied man in the country could be furnished with work to-morrow. Universal education will not. The realization of the highest hopes of the temperance and labor reformers will not. The general adoption of the Christian religion will not. But all these grand and divine agencies working together will reduce them to a minimum, and make that community which tolerates them indictable at the bar of public opinion, the most powerful tribunal known.

"Physical agencies, without all the higher elements, can do but little. The early history of this country and the history of all countries where civilization has made any headway teach this truth.

"The proposition that pauperism and crime are less frequent in cultured communities will not, I suppose, be debated. It is true that the intelligent, skilled laborer is rarely found either in a penal or a charitable institution; nor is the person who has the elementary education sufficient to enable him to read, write, and make his own calculations so liable to become a charge as the one who has not these qualifications. I am, of course, aware that the full accuracy of these statements is oftentimes questioned; yet it is statistically true that enough of knowledge to be of value in increasing the amount and quality of work done, to give character, to some extent at least, to a person's tastes and aspirations, is a better safeguard against the inroads of crime than any code of criminal laws. I must, of course, consider this point as a fact, and shall not weary you with the oft-repeated arguments and the usual array of figures used to convince legislators that it is wise economy to foster our educational institutions. This being conceded as to intellectual or mental requirements, including elementary book-learning, how does the fact affect the matter under consideration? Simply that the kind of labor which requires the most skill on the part of the workman to perform insures him most perfectly against want and crime, as a rule.

"This statement is fortified by such statistics as are available. Of 430 convicts, at one time, in the State of Massachusetts, 299, or 69 per cent., were returned as having no occupation.

Unemployment.

"The adult convicts numbered at that time 297. Of these 46 were illiterate; and the warden of the State prison, for the year in question, stated that of 220 men sentenced during that year, 147 were without a trade or any regular means of earning a living.

"In Pennsylvania, during a recent year, nearly 88 per cent. of the penitentiary convicts had never been apprenticed to any trade or occupation; and this was also true of 68½ per cent. of the convicts sentenced to county jails and workhouses in the same State during the same year.

"In Mr. Frederick Wines' recent report on homicide in the United States, in 1890, it is shown that of 6953 men, 5175, or more than 74 per cent. of the whole, were said to have no trade. . . .

"Furthermore, it is true, so far as the statistics which I have been able to consult demonstrate, that during periods of industrial depressions crime of almost all grades is increased in volume. The difficulty of demonstrating this feature of my subject to any full extent lies in the fact that our criminal statistics are given for periods, and not year by year. Could we have annual statements of the convictions in all our States, so that such statements could be consulted relative to economic conditions, I feel sure that we should find a coordination of results that would startle us all. We should find that the lines of crime rise and fall as the prosperity of the country falls and rises. . . .

"It is perfectly true that unsanitary conditions, and all conditions that work a deterioration in the health of people, lead to uneconomic conditions. Bad air, bad housing, bad drainage, lead to intemperance and want. It requires no argument to show that these are precursors of crime. Anything that brings about a higher rate of mortality among the children of the poor leads to crime, and it is perfectly deducible from facts that are known that any occupation which insures a high rate of mortality among the children of its participants tends to conditions most favorable to the prevalence of pauperism and crime.

"The displacement of labor through the application of improved machinery temporarily, and to the individual, produces a condition of want which may or may not be remedied by the increased labor demanded through invention. Society can be easily answered by stating the benefits which come to it through inventive genius, but it is a poor answer to the man who finds the means of supporting his family taken from him. But with the progress of invention and the consequent elevation of labor both pauperism and crime, so far as society is concerned, have correspondingly decreased. This is true in more senses than one. The age of invention, or periods given to the development and practical adaptation of natural laws, raises all peoples to a higher intellectual level, to a more comprehensive understanding of the world's march of progress.

"But the question of the removal of poverty and the suppression of crime is not wholly with the working man; the employer has as much to learn as he, and he is to be held to equal, if not greater, responsibility. Ignorant labor comprehends ignorant employer. Inasmuch as the profits of labor are equitably shared with labor, inasmuch as poverty is lessened, and inasmuch as crime is lessened, inasmuch as crime decreased. The employer should always remember that if conditions become ameliorated, if life becomes less of a struggle, if leisure be obtained, civilization, as a general rule, advances in the scale. If these conditions be reversed, if the struggle for existence tends to occupy the whole attention of each man, civilization disappears in a measure, * communities become dangerous, and the people seek a revolutionary change, hoping by chance to secure what was not possible by honest labor.

Labor.

"In a State in which labor had all its rights there would be, of course, little pauperism and little crime. On the other hand, the undue subjection of the laboring man must tend to make paupers and criminals, and entail a financial burden upon wealth which it would have been easier to prevent than to endure; and this prevention must come in a large degree through educated labor.

"Do not understand me as desiring to give the impression that I believe crime to be a necessary accompaniment of our industrial system. I have labored in other places and at other times to prove the reverse, and I believe the reverse to be true. Our sober, industrious working men and women are as free from vicious and criminal courses as any other class. What I am contending for relates entirely to conditions affecting the few. The great volume of crime is found outside the real ranks of industry.

"The modern system of industry has reduced the periods of depression from the long reaches extending over half a century under older systems. These periods have been reduced to decades and half decades of years. The time will come when periods of depression will occur only for the few months of a single year, and when this time comes the columns of the statistics of crime will show a receding quantity. Infinitely superior as the modern system is over that which has passed, the iron law of wages, when enforced with an iron hand, keeps men in the lowest walks of life, often on the verge of starvation. As intelligence increases and is more generally diffused, the individual man wants more, has higher aspirations for himself and his family; but, under the iron law of wages, at times, all these desires and aspirations are hard to satisfy. The modern system produces mental friction; a competition of mind has taken the place, in a large measure, of mere muscular competition, and the laggard in the industrial race may lose his mind or his conscience, in the latter case causing him to develop into the criminal. The economic condition or environment of this particular man leads him inevitably to crime."

On the other hand, and in opposition to the above views, Mr. W. D. Morrison, of the (English) Wandsworth Prison, in his volume *Crime and its Causes*, denies that destitution or poverty are powerful factors in producing crime. He says that if destitution were a prominent factor in producing crime, the crimes most prevalent would be begging and theft. Yet, he says, out of the total number of cases tried in England and Wales during the year 1887-88, 726,698,

* Rawlinson's *Origin of Nations*.

or only 8 per cent., were offenses against property, excluding cases of malicious damage, and only 7 per cent. offenses against the Vagrancy Acts. This makes only 15 per cent., yet he argues that all these cases cannot be laid to destitution, because his inquiries show that fully one half of the offenders of this class had work when they committed the offense. Add to these the great bulk of juvenile offenders and those who steal because of a thievish disposition, and there is only a small percentage left. Yet this is not all. Many offenders of this class are habitual criminals, professional burglars, shoplifters, etc., who are able often to pay counsel high fees; these cannot be said to be driven to crime through destitution. As for vagrants, we must not forget the large class of habitual or professional beggars who will not work (see TRAMP), who are, perhaps, destitute, but not destitute from necessity. He says M. Monod, of the Ministry of the Interior in France, arranged with some merchants and manufacturers to offer work at 4 frs. (80 cents) per day to any persons he sent them. In eight months, 727

beggars applied to him for help, and were told to come the next day and receive a letter which would enable them to get work at the above price. Four hundred and fifteen never came, 138 more came, but never presented their letter. Of the whole number only 18 continued at work three days. Mr. Morrison figures, after careful argument, that only 4 per cent. of the criminal population commit crime from destitution. As for poverty as distinguished from destitution, Mr. Morrison argues that not much crime can be due to poverty, because if it were there would be most theft where there was the most poverty; and he says this is not the fact, and presents the appended table, extracted from a larger one by Signor L. Bodio, Director-General of Statistics for Italy. The calculations for every country except Spain are based on the census of 1880 or 1881; the calculations for Spain are based on the census of 1877. In all the countries except Germany and Spain the calculations are based on an average of five years; for Germany and Spain the average is only two years.

Country	Year	Annual trials for theft per 100,000 inhabitants,	221
Italy,	1880-84	"	"
France,	1879-83	"	121
Belgium,	1876-80	"	143
Germany,	1882-83	"	262
England,	1880-84	"	228
Scotland,	1880-84	"	289
Ireland,	1880-84	"	101
Hungary,	1876-80	"	82
Spain,	1883-84	"	74

Mr. Morrison says:

"To what conclusions do the statistics contained in this table point? It is useless burdening this chapter with additional figures to prove that England and France are the two wealthiest countries in Europe. The wealth of England, for instance, is perhaps six times the wealth of Italy; but, notwithstanding this fact, more thefts are annually committed in England than in Italy. The wealth of France is enormously superior to the wealth of Ireland, both in quantity and distribution, but the population of France commits more offenses against property than the Irish. Spain is one of the poorest countries in Europe, Scotland is one of the richest, but side by side with this inequality of wealth we see that the Scotch commit, per 100,000 of the population, almost four times as many thefts as the Spaniards. With the exception of Italy it is the poorest countries of Europe that are the least dishonest, and, according to our table, even the Italians are not so much addicted to offenses against property as the inhabitants of England.

"Perhaps the most instructive figures in these international statistics are those relating to England and Ireland. The criminal statistics of the two countries are drawn up on very much the same principles; the ordinary criminal law is very much the same, and there is very much the same feeling among the population with respect to ordinary crime; in fact, with the exception of agrarian offenses, the administration of the law in Ireland is as effective as it is in England. On almost every point the similarity of the criminal law and its administration in the two countries almost amounts to identity, and a comparison of their criminal statistics, in so far as they relate to ordinary offenses against property, reaches a high level of exactitude. What does such a comparison reveal? It shows that the Irish, with all their poverty, are not half so much addicted to offenses against property as the English, with all their wealth, and it serves to confirm the idea that the connection between poverty and theft is not so close as is generally imagined.

"International statistics, then, as far as they go, point to the conclusion that it is the growth of wealth, rather than the reverse, which has a tendency to augment the number of offenses against property, and national statistics, as far as England is concerned, exhibit a similar result. . . .

"If we look at crime in general, instead of that par-

ticular form of it which consists in offenses against property, it will likewise become apparent that it is not so closely connected with poverty as is generally believed. The accuracy of Indian criminal statistics is a matter that has already been pointed out.

When these statistics are placed side by side with our own what do we find? According to the returns for the two countries in the year 1888, it comes out that in England one person was proceeded against criminally to every 42 of the population, while in India only one person was proceeded against to every 195. In other words, official statistics show that the people of England are between four and five times more addicted to crime than the people of India. On the supposition that poverty is the parent of crime, the population of India should be one of the most lawless in the world, for it is undoubtedly one of the very poorest. The reverse, however, is the case, and India is justly celebrated for the singularly law-abiding character of its inhabitants. . . .

"A further illustration of the same fact will be found on examining the prison statistics of the United States. According to an instructive paper recently read by Mr. Roland P. Falkner before the American Statistical Association, the foreign-born population in America is, on the whole, less inclined to commit crime than the native-born American. In some of the States—Maine, New Hampshire, Vermont, and California—the foreign born," says Mr. Falkner, "make a worse showing than the native. In a great number of cases, notably Massachusetts, Pennsylvania, and Tennessee, we notice hardly any difference. Elsewhere the showing is decidedly in favor of the foreign born, and nowhere more strongly than in Wisconsin and Minnesota." (See CRIME.) It is perfectly certain that the foreign-born population of the United States is not, as a rule, so well off economically as the native-born citizen. The vast proportion of the emigrant population is composed of poor people seeking to better their condition, and it is well known that a large percentage of the hard, manual work done in America is performed by those men. The economic condition of the average native-born American is superior to the economic condition of the average emigrant; but the native American, notwithstanding his economic superiority, cuts a worse figure in the statistics of crime. . . .

**Poverty not
a Cause of
Crime.**

"A further illustration of this significant truth is to be witnessed in the Antipodes. In no quarter of the world is there such widespread prosperity as exists in the colony of Victoria. All writers and travellers are unanimous upon this point. Nowhere in the world is there less economic excuse for the perpetration of crime. Work of one kind or another can almost always be had in that favored portion of the globe.

"Even in the worst of times, if men are willing to go 'up country,' as it is called, occupation of some sort is certain to be found, and trade depression never reaches the acute point which it sometimes does at home.

"Nevertheless, on examining the criminal statistics of the colony of Victoria, what do we find? According to the returns for 1887, one arrest on a charge of crime was made in every 30 of the population, and on looking down the list of offenses for which these arrests were made, it will be seen that Victoria, notwithstanding her widely diffused material well-being, is just as much addicted to crimes against person and property as some of the poor and squalid States of Europe. It may be said in extenuation of this condition of things that Victoria contains a larger grown-up population, and, therefore, a larger percentage of persons in a position to commit crime than is to be found in older countries. This is, to a certain extent, true, but the difference is not so great as might at first sight be supposed. Assuming that the criminal ages lies between 15 and 60, we find that in the seven Australasian colonies 563 persons out of every 1000 are alive between these two ages. In Great Britain and Ireland 550 persons per 1000 are alive between 15 and 60. According to these figures, the difference between the population within the criminal age in the colony, as compared with the mother country, is very small, and is quite insufficient to account for the relatively high percentage of crime exhibited by the Victorian criminal statistics.

"All these considerations force us back to the conclusion that an abundant measure of material well-being has a much smaller influence in diminishing crime than is usually supposed, and compels us to admit that much crime would still exist even if the world were turned into a paradise of material prosperity tomorrow."

If it be asked to what causes Mr. Morrison does lay excess of crime, it is to be answered, to the effect of climate and season.

To prove the first point, he shows that while race makes some difference in the amount of crime, people of different races do not materially differ in the amount of crime they commit in the same climate, while people of the same race do materially differ in different climates. He shows that in the proportion of murders to the population in European countries (see HOMICIDE), Italy, Spain, and Hungary head the list; Austria and Belgium come next; France, Ireland, and Germany follow; England, Scotland, and Holland stand at the bottom. He shows that this cannot be due to the conditions of civilization or economic conditions, because poor countries and uncivilized countries do not by any means always have many murders. M. de Quatrefages argues that in crime white men are scarcely more moral than black. If poverty were the

cause of the difference, why should Ireland be so different from Italy? For the same reason it cannot be religion. In America he argues that white men of the South commit more homicides than white men of the North. Above all, he compares the Australian colony of Victoria with Great Britain. He argues that the population in Victoria is better than the average in Great Britain, its general prosperity greater, its police more thorough, and yet he shows crime to be much more frequent in Victoria in proportion to the population.

In the same line of argument, Mr. Morrison shows that crime, from October to February, falls with the falling temperature, and from February to October climbs with the climbing temperature. He says that the cause of this cannot be economic, because in the summer it is easier to get work. He shows, too, that in summer there are more offenses against prison order than in winter.

Climate.

Thus far we have been considering the effect of environment upon crime. But heredity contributes to the result. Says Mr. H. M. Boies (*Prisoners and Paupers*, pp. 266, 279):

"We believe it is established beyond controversy that criminals and paupers, both, are degenerate; the imperfect, knotty, knurly, worm-eaten, half rotten fruit of the race. In short, both criminality and pauperism are conditions and not dispositions. The mind, the intellectual faculties, and the soul, the moral faculties—which are the motive powers of character, which constitute the man—have their home in his body, to which they are conformed, which they represent, and by which they are limited and controlled in their operations, as well as in their conditions. A normal character is not to be expected in an abnormal physique, nor a sound and healthy character in a diseased constitution.

Heredity.

"The law that 'like begets like' is by no means confined to criminals and paupers, but operates inexorably in all classes and conditions of people. A taint of hereditary drunkenness, insanity, suicide, epilepsy, idiocy, deaf-mutism, cancer, syphilis, gout, rheumatism, tuberculosis or scrofulous diathesis in the blood is a symptom of degeneration, likely to be intensified by propagation in succeeding generations until the tainted family becomes extinct. Intermarriage with those tainted diffuses weakness, deformity, and abnormality through the social structure, deteriorates and contaminates all who issue from such unions. These things are well known and completely established. We have not space for the argument here."

The diagrammatic history of eight families, given below, are taken from Dr. Strahan's book (*Marriage and Disease*, a study of hereditary and the more important family degenerations, 1892) and illustrate the evil more impressively than argument.

S. H.—'S FAMILY.

It is true that most scientists to-day believe that environment has greater influence on character than heredity, and that heredity transmits only the natural and not the acquired habits of the parent. Says Mr. Morrison (*Crime and its Causes*, p. 189):

"The son of a rope-dancer does not inherit his father's faculties for rope-dancing, nor the son of

an orator his father's ready aptitude for public speech, nor the son of a designer his father's acquired skill in the making of designs. All that the son inherits is the natural faculties of the parent but no more. Hence it follows that the son of a thief, on the supposition that thieving comes by habit and practice, does not by natural inheritance acquire the parent's criminal propensity. As far as his natural faculties are concerned he starts life free from the vicious habits of his parent, and should he in turn become a thief, as sometimes happens, it is not because he has inherited his

father's thievish habits, but because he has himself acquired them. It is imitation, not instinct, which transforms him into a thief; and if he is removed from the influence of evil example he will have almost as small a chance of falling into a criminal life as any other member of the community."

"Nevertheless, natural characteristics are transmitted. In a recent communication to a German periodical, Herr Sichart, Director of Prisons in the kingdom of Württemberg, has shown that a very high percentage of criminals are the descendants of degenerate parents. Herr Sichart's inquiries extended over several years and included 1714 prisoners. Of this number 16 per cent. were descended from drunken parents; 6 per cent. from families in which there was madness; 4 per cent. from families addicted to suicide; 1 per cent. from families in which there was epilepsy. In all, 27 per cent. of the offenders examined by Herr Sichart were descended from families in which there was degeneracy. According to these figures, more than one fourth of the German prison population have received a defective organization from their ancestry, which manifests itself in a life of crime."

"In France and Italy the same state of things prevails. Dr. Corre is of opinion that a very large proportion of persons convicted of bad conduct in the French military service are distinctly degenerate either in body or mind. Dr. Virgilio says that in Italy 32 per cent. of the criminal population have inherited criminal tendencies from their parents." Of England Mr. Morrison says:

"The population in the local jails in 1888-89, between the ages of 21 and 40, constituted 54 per cent. of the total prison population, while the same class between the ages of 40 and 60 formed only 20 per cent. of the prison population. One half of this drop in the percentage of prisoners between 40 and 60 may be accounted for by the decreased percentage of persons between these two ages in the general population. The other half can only be accounted for by the extent to which premature decay and death rage among criminals who have passed their fortieth year. In other words, the number of criminals alive after 40 is much smaller than the number of normal men alive after that age."

"A direct proof of the extent of degeneracy in the shape of insanity among persons convicted of murder can be found in the judicial statistics. The number of persons convicted of wilful murder, not including manslaughter or non-capital homicides, from 1879 to 1888 amounted to 441. Out of this total 143, or 32 per cent., were found insane. Of the 299 condemned to death, no less than 145, or nearly one half, had their sentences commuted, many of them on the ground of mental infirmity. The whole of these figures decisively prove that between 40 and 50 per cent. of the convictions for wilful murder are cases in which the murderers were either insane or mentally infirm."

The socialist view of the causes of crime is that they may be summed up in one word, *environment*, produced by a capitalistic system. It agrees with Mr. Boies when he says (*Prisoners and Paupers*, p. 263):

"We have been convinced by our study that most of those characteristics which have hitherto been treated as causes, such as ignorance, intemperance, poverty, disease, and defects, are symptoms indicating a social state or condition of crime and pauperism, rather than causes of them."

Most of the above quotations are simply illustrations of the power of environment produced by capitalism upon character. As for Mr. Morrison's supposed proof that want and destitution do not produce crime, because there

is more crime in wealthy countries like England and France than in poor countries like Ireland and Italy, Mr. Morrison forgets that the average wealth of a country does not prove that there are not poor people there. England and France are wealthier than Ireland and Italy, but still there may be more desperate poverty, above all, more poverty crowded in great cities, in wealthy countries than in poor. India is poor and comparatively free from crime (not necessarily free from immorality), but India does not have the kind of poverty produced by a capitalist system. It is not poverty simply, but poverty and bad environment, produced by a seeking after profits which blesses neither the wealthy nor the poor, and tends to increase crime in both classes.

III. THE PREVENTION OF CRIME.

If the cause of crime be poor homes, intemperance, lack of proper education for children, lack of family life, etc., it is easy to see that the way to prevent crime is to reduce intemperance, educate children, and give a proper environment to all classes. Said Mr. Charlton T. Lewis, President of the New York Prison Association, in the opening address at the International Congress of Charities and Corrections at Chicago in 1893:

"There is now stirring in the general mind a sense that we are on the eve of one of the greatest social revolutions which mankind has ever experienced, and that the revolution will be a reorganization of society, a reconstitution of law, a reformation of the courts, a reconstruction of the system of dealing with crime. . . . The business of society in protecting itself against the criminal, or warring against crime, in striking the blow of vengeance at the criminal, has given place to the work of charity to the criminal."

How society can bring proper education and environment to all classes is too vast a subject to be considered here. It is the subject of this whole encyclopedia. (See especially EDUCATION; INDUSTRIAL EDUCATION; UNEMPLOYMENT; CITY; TENEMENT-HOUSE QUESTION; SLUMS; TEMPERANCE; CHARITY ORGANIZATIONS; SOCIALISM, etc.)

A few points here may be noted. Says Mr. Boies (*Prisoners and Paupers*): "The problem then is that of the reformation of city life. . . . It is important that an improved system of public charities should be organized in all cities to prevent the abuse of benevolence. The organization of charity, which has begun under this necessity, ought to be perfected and sustained by law. It should comprehend within its scope the reinstatement of the family unit in its original potentiality in urban life. It must endeavor to adapt the family to its urban environments, and urban environments to the essential family privacy and integrity."

"The very plan and method of institutional charity is a mistake in almost every direction. It violates the primordial principle of the social organization by the effort to substitute communal treatment for the natural family arrangement. . . .

"The general consensus of the wisest students of sociology is coming to favor a smaller classification and a more domestic provision for dependents, that which most closely resembles and reproduces private family relations in the reduced classification, as most hopeful of wide and permanent success. . . .

"These factors of the problem of city life seem to require the exercise of public power. . . .

"One of the primary objects of good local government in cities should be the restoration of a fair equilibrium in density of population. . . .

Social
Reforms.

"The Health Department of New York reported in 1891 a count of 37,358 tenement houses in the city, occupied by 276,565 families and 1,225,411 souls. This shows an increase of over 200,000 in tenement population in three years, and an average of 32.8 occupants to each tenement! The average density of the 22 largest cities in the country was 15.92 persons to the acre, so that the greatest density in New York was 32 times, and in Philadelphia 10 times the average.

"It ought to be the province of the Government to relieve this social congestion. People do not live in misery from choice, but because they are unable to escape it. Let society, in self-protection, open up the way of escape if it can, and nature will relieve itself. Real estate in cities increases in value according to its accessibility to transportation terminals and occupation centers. The poor abide where they obtain subsistence, because they cannot afford the time and money to live farther away. Offer them cheap and quick transfer to healthier and better homes, and they will quickly spread themselves out of their stifling abodes.

"It becomes a public necessity, then, to provide rapid and cheap transportation from centers to suburbs. . . .

"An autonomic municipality should and would greatly improve its police. It would recognize its increased dependence upon it, and the importance of making it the absolutely safe reliance which it should be. The municipal police is the public executive force, the manifestation of the authority and power of the people's government. Instead of being the tool of politicians, it must be made entirely independent of and superior to partisanship. . . .

"All our cities must provide for the adaptation of the rising generations to the probable needs of the coming time, for the general advantage indeed, but especially to reduce the herds of the idle—the prolific source of crime and poverty. This provision cannot safely be left longer to the bequests of the benevolent. It has become a necessary function of government, as imperative as the public school, as palpable and obligatory as the provision of almshouses, asylums, and prisons, and a thousand times better. A fraction of the sums expended in maintaining these would be sufficient to transform idleness into earning, and largely empty them of their inmates—an ounce of prevention, equivalent to many pounds of ineffectual cure.

"It will be necessary to remove those who are incapable, by nature or disposition, of adaptation to a higher life to the simpler requirements of the country, to locations where labor suitable to their abilities is in demand. The time has come when the public welfare requires not only that the advantages of adaptation shall be general and sufficient, but also that the privileges of a constant and even equilibrium of work and labor shall be maintained uniformly, and without friction. The ease and economy of modern facilities of travel and transportation, in America certainly, have not only made great famines impossible, but human idleness inexcusable. If the hands are unfit, and cannot be made fit for the work at hand, let society see to it that they are taken where fit work waits."

Employment.

As to intemperance, Mr. Boies advocates taxing liquor enough to make it meet the expense of a greatly increased number of asylums, Keeley institutes, etc., and the gradual reduction of intemperance by strict laws restricting or prohibiting the sale of liquor to minors, paupers, etc., and punishing offenders. He would also have coffee houses and other substitutes for the saloon, and have the State teach hygienic cooking to all classes. (See TEMPERANCE.)

The State, he says, cannot, however, do all. The redemption of the urban population is not to be expected from the action of the Government alone, altho this may facilitate it. Government may restrict and abolish drinking-saloons, gambling saloons, and brothels. It may punish vice and crime; it may chase immorality from public sight. It must provide for the helpless indigent, and put forth effort to reform the criminal in its hands. But the reformation and elevation of

society at large devolves upon philanthropy, patriotism, and the Church of Christ.

On this point Mr. Forbes Winslow says (*Youthful Eccentricity a Precursor to Crime*):

"An education which merely instructs will encourage crime. One which coordinates the faculties of the mind, which gives exercise to reason and judgment, at the same time that it represses without ignoring the instinctive part of man's nature, will elevate his position in the scale of the creation, and turn those faculties to the services of his fellow-creatures which otherwise would be employed to their destruction. If the emotions be constantly trampled down and invariably subordinated to reason, they will in time assert their claims, and break forth in insanity or crime; if they be constantly indulged, the result will probably be the same. . . . I am no opponent to the diffusion of knowledge; but I am to that description of information which has only reference 'to the life that is, and not to that which is to be.' Such a system of instruction is of necessity defective, because it is partial in its operation.

"Teach a man his duty to God, as well as his obligations to his fellow-men; lead him to believe that his life is not his own, and we disseminate principles which will give expansion to those faculties that alone can fortify the mind against the commission of a crime alike repugnant to all human and Divine laws."

Concerning the methods of reaching the economic causes of crime, Mr. Carroll D. Wright says, in the paper quoted above :

"Trade instruction, technical education, manual training—all these are efficient elements in the reduction of crime, because they all help to better and truer economic conditions. I think, from what I have said, the elements of solution are clearly discernible. Justice to labor, equitable distribution of profits under some system which I feel sure will supersede the present, and without resorting to socialism, instruction in trades, by which a man can earn his living outside a penal institution, the practical application of the great moral law in all business relations—all these elements, with the more enlightened treatment of the criminal when apprehended, will lead to a reduction in the volume of crime, but not to the millennium."

So far as heredity contributes to crime, Mr. Boies would meet it by strict marriage laws. He says (*Prisoners and Paupers*, p. 277) :

"It is an astonishing and incomprehensible fact to the student that society, among all the plans and projects it is continually devising for the benefit and elevation of humanity, has in our modern civilization utterly overlooked and ignored the one vital social function upon which improvement of the race depends. Marriage, which constitutes the social unit, which creates the family, whence the generations succeed one another in upward or downward progress, has been left by philanthropy, by Church and State, except by the recognition and solemnization of the fact itself, almost as entirely unregulated as it was in the days of savage life, as it is among wild animals. The union of the pair upon whose fitness will depend the physique and character of the next generation is submitted by society to 'natural selection' and 'chance.' If otherwise influenced at all, it is solely by material considerations of selfish, temporary importance rather than those affecting the real object and purpose of the union, the children who are to come of the union. Its doubtful if one in a thousand of those who marry ever take this subject into consideration in their selections. If they were to do so, indeed, there would be no proper method available to determine the questions needing settlement. So this seriously vital function is settled by caprice and 'chance.' The chances remaining about the same, the results have been about the same for thousands of years, save for the multiplication of the unit.

"Society has willingly expended, and continues each year to expend, vast sums of money and great labor in the support of religious institutions, preachers, and churches for the moral elevation of the people. It submits cheerfully to pay the largest share of the public tax, and contributes immense amounts in addition, benevolently, to promote their intellectual progress. It founds and supports medical colleges, stimulates physical culture by encouraging athletic games and

sports, and advocates the improvement of the physique in every imaginable direction. Religion and philanthropy join their forces in ceaseless and exhausting effort to stem the resistless tide which appears to be sweeping the race over the cataract of extinction, sustained by faith in the eternal promise of a millennium rather than encouraged by any palpable success. They contend valiantly against overwhelming results, ignorant or oblivious of the easily controlled causes.

Let it once assume the regulation of the propagation of the race with wisdom and faithful efficacy, and all the other burdens and labors will become light and full of promise, hope, and fruit. It must control this vital function of marriage for the public welfare, as well as for the private good of the individual. This control is sanctioned and required by the divine right of self-preservation, and has become an imperative duty to the race and to God—a duty supreme in impulse and in consequence.

"Nor is its performance impeded by great difficulties. The tentative measures which have been enacted, the previous license, the consent of parents or guardians for minors, the prohibited marriage of the idiot and raving maniac, have secured unanimous approval. So, eventually, the common-sense of mankind will endorse the enactment of whatever provisions are essential to the common welfare.

"We recommend, as the next step, the enactment of a code regulating marriage fully in these respects, and by some such methods, as follows:

"First, it should be required that a license must in all cases be obtained from a county official before a legal marriage can be made.

"Second, severe penalties should be imposed upon any who perform the marriage ceremony without the presence of the prescribed license, which should have a blank upon it for the marriage certificate, with the ages, residence, parentage, nativity, and race of the parties; the signature of witnesses, and the certificates of one or more reputable physicians, under oath, testifying to a knowledge of the following facts, derived from personal acquaintance with the persons and families of the parties, or from other satisfactory evidence.

"That they are both of proper marriageable age, in good health, sound and complete physically, neither intemperate, criminals, nor paupers; whether either parents or grandparents were lunatics, drunkards, idiotic, epileptic, congenitally blind, deaf, or deformed, or of syphilitic, cancerous, scrofulous, or tuberculous constitution.

"The license papers should be issued in duplicate, and one copy with all blanks filled should be filed and recorded in the county clerk's office. A false certificate by a physician should prevent the further practice of his profession. The law should strictly prohibit the marriage of females under 20, and males under 25; of males over 45 with females over 40 who have not passed the period of child-bearing (for outside of these limitations of age it is generally understood healthy children are exceedingly improbable, if not impossible); of habitual criminals, paupers, tramps, and vagrants; of the insane, idiotic, epileptic, paralytic, syphilitic, intemperate, cancerous, scrofulous, and tuberculous; of the congenitally blind, deaf, defective, or deformed; the children or grandchildren of parents possessed of these taints, or of suicides, which is of itself presumptive evidence of degeneracy.

"The infraction of this law or the cohabitation with prohibited persons should be punished by the permanent seclusion of both parties in the penitentiaries provided for life confinements.

"This is neither a complicated nor impracticable scheme. Consider what the results would be. In the brief course of one generation all the inherited rottenness and corruption of the ages would be purged out of the people. The criminal and pauper class, as a class, would become extinct. Penitentiaries, jails, almshouses, insane asylums, idiot, deaf and dumb and blind asylums would be largely depopulated. Intemperance, the fruitful mother of all evil, sin, and suffering, would become a rare vice; suicide, the refuge of conscious incompetence, which has increased at the rate of 33 per cent. in 25 years in England,* and quite as much here, would be an almost unknown crime; the growing burden of inordinate taxation and benevolence for the dependent would be lifted from society; the evils of divorce would cease, chronic diseases would disappear almost entirely, and temporary ailments be robbed of more than half their terrors;

more than half of the poignant grief and affliction over the untimely death of children would be avoided; health and strength and ruddy cheeks would delight the eyes and hearts that now grieve over puny forms and wan faces; doctors' bills would no longer drain the family resources; the earning power of the next generation would be magnified, its capacity for intellectual improvement and education increased, its susceptibility to moral and religious influence and government intensified, and the whole race rebound from the depression of its past with a buoyancy and power equal to the full development of its age of steam and electricity."

For the treatment of prisoners and its important bearing on the prevention of crime, see PENOLOGY.

CRISES (COMMERCIAL AND MONETARY).—A time of general difficulty and pressure in commercial and monetary circles, if acute, is called a *crisis*; if prolonged it is usually called a *period of depression*. A crisis, too, must not be confused with a panic. A panic starts with a group of speculators, perhaps occasioned by some disastrous event or report of a disastrous effect. The market is upset. Weaker firms fail; yet there is no general crisis and the market soon recovers. A crisis lasts longer and is general, tho it is often connected with panics. Crises, whatever be their cause, usually follow a certain course, which it is asserted by some writers, Jevons prominently among them, follows a certain cycle. Jevons in his *Political Economy Primer* thus describes them. He tells us (pp. 115-119) that the cause of this cycle is not well understood, but then says:

"There can be no doubt that in some years men become confident and hopeful. They think that the country is going to be very prosperous, and that if they invest their capital in new factories, banks, railways, ships, or other enterprises, they will make much profit. When some people are thus hopeful, others readily become so too, just as a few cheerful people in a party make everybody cheerful. Thus the hopefulness gradually spreads itself through all the trades of the country. Clever men then propose schemes for new inventions and novel undertakings, and they find that they can readily get capitalists to subscribe for shares. This encourages other speculators to put forth proposals, and when the shares of some companies have risen in value, it is supposed that other shares will do so likewise. The most absurd schemes find supporters in a time of great hopefulness, and there thus arises what is called a bubble or mania.

"When the schemes started during a bubble begin to be carried out, great quantities of materials are required for building, and the prices of these materials rise rapidly. The workpeople who produce these materials then earn high wages, and they spend these wages in better living, in pleasure, or in buying an

* *Marriage and Disease*, p. 88.

unusual quantity of new clothes, furniture, etc. Thus the demand for commodities increases, and tradespeople make large profits. Even when there is no sufficient reason, the prices of the remaining commodities usually rise, as it is called, by sympathy, because those who deal in them think their goods will probably rise like other goods, and they buy up stocks in the hope of making profits. Every trader now wants to buy, because he believes that prices will rise higher and higher, and that, by selling at the right time, the loss of any subsequent fall of prices will be thrown upon other people.

"This state of things, however, cannot go on very long. Those who have subscribed for shares in new companies have to pay up the calls—that is, find the capital which they promised. They are obliged to draw out the money which they had formerly deposited in banks, and then the bankers have less to lend.

Course of Crises.

Manufacturers, merchants, and speculators, who are making or buying large stocks of goods, wish to borrow more and more money, in order that they may have a larger business, the profit seeming likely to be so great. Then, according to the laws of supply and demand, the price of money rises, which means that the rate of interest for short loans, from a week to three or six months in duration, is increased. The bubble goes on growing, until the more venturesome and unscrupulous speculators have borrowed many times as much money as they themselves really possess. Credit is said to be greatly extended, and a firm which perhaps owns a capital worth £10,000 will have undertaken to pay £200,000 or £300,000 for the goods which they have bought on speculation.

"But the sudden rise which, sooner or later, occurs in the rate of interest, is very disastrous to such speculators; when they began to speculate interest was, perhaps, only 2 or 3 per cent.; but when it becomes 7 or 8 per cent., there is fear that much of the profit will go in interest paid to the lenders of capital. Moreover, those who lent the money, by discounting the speculators' bills, or making advances on the security of goods, become anxious to have it paid back. Thus the speculators are forced at last to begin selling their stocks at the best prices they can get. As soon as some people begin to sell in this way, others who hold goods think they had better sell before the prices fall seriously; then there arises a sudden rush to sell, and buyers being alarmed, refuse to buy except at much reduced rates. The bad speculators now find themselves unable to maintain their credit, because, if they sell their large stocks at a considerable loss, their own real capital will be quite insufficient to cover this loss. They are thus unable to pay what they have engaged to pay, and stop payment, or, in other words, become bankrupt. This is very awkward for other people, manufacturers, for instance, who had sold goods to the bankrupts on credit; they do not receive the money they expected, and as they also perhaps have borrowed money while making the goods, they become bankrupt likewise. Thus the discredit spreads, and firms even which had borrowed only moderate sums of money, in proportion to their capital, are in danger of failing. . . .

"No one ventures to propose a new scheme or a new company, because he knows that people in general have great difficulty in paying up what they promised to the schemes started during the bubble. This bubble is now burst, and it is found that many of the new works and undertakings from which people expected so much profit are absurd and hopeless mistakes. It was proposed to make railways where there was nothing to carry; to sink mines where there was no coal nor metal; to build ships which would not sail; all kinds of impracticable schemes have to be given up, and the capital spent upon them is lost.

"Not only does this collapse ruin many of the subscribers to these schemes, but it presently causes workpeople to be thrown out of employment. The more successful schemes indeed are carried out, and, for a year or two, give employment to builders, iron manufacturers, and others, who furnish the materials. But as these schemes are completed by degrees, no one ventures to propose new ones; people have been frightened by the losses and bankruptcies and frauds brought to light in the collapse, and when some people are afraid, others readily become frightened likewise by sympathy. In matters of this kind, men of business are much like a flock of sheep which follow each other without any clear idea why they do so. In a year or two the prices of iron, coal, timber, etc., are reduced to the lowest point; great losses are suf-

fered by those who make or deal in such materials, and many workmen are out of employment. The working classes then have less to spend on luxuries, and the demand for other goods decreases; trade in general becomes depressed; many people find themselves paupers, or spend their savings accumulated during previous years. Such a state of depression may continue for two or three years, until speculators have begun to forget their failures, or a new set of younger men, unacquainted with disaster, think they see a way to make profits. During such a period of depression, too, the richer people, who have more income than they spend, save it up in the banks. Business men as they sell off their stocks of goods leave the money received in the banks; thus by degrees capital becomes abundant, and the rate of interest falls. After a time bankers, who were so very cautious at the time of the collapse, find it necessary to lend their increasing funds, and credit is improved. Then begins a new credit cycle, which probably goes through much the same course as the previous one."

Such is Jevons's description of a general crisis; crises started by particular causes we shall consider under the history of crises below. It is necessary now to point that Jevons and other economists claim that general crises not only follow a **Periodicity**, somewhat fixed course, but occur at somewhat fixed periods. Thornton, Tooke, Langton, Mr. John Mills, of Manchester, and Jevons have all treated this subject at length. Palgrave's *Dictionary of Political Economy* says:

"An enumeration of recorded years of acute commercial distress—1753, 1763, 1772-73, 1783, 1793, 1815, 1825, 1836-39, 1847, 1857, 1866, 1878, 1890—suggests periodicity. During these 140 years trade and banking have been carried on in war and peace, with a silver standard, with a gold standard, under a suspension of cash payments, in times of plenty and in times of want; but the fatal years have come round with a considerable approach to cyclical regularity. While admitting that the commercial crises to which this generation has been exposed have been less acute than those which afflicted the close of the last and the beginning of the present century, the fact of their recurrence in something like periodicity remains."

Jevons explained crises in part by bad crops, and these by sun-spot periods. He says in a communication to the British Association (1862):

"There is a periodic tendency to commercial distress and difficulty during these months (October and November). It is when great irregular fluctuations aggravate this distress, as in the years 1836, 39, 1847, 1857, that disastrous breaches of commercial credit occur."

And again (*Journal of the Statistical Society of London*, 1866, vol. xxix., p. 249): "These changes arise from deficient or excessive harvests, from sudden changes of supply or demand in any of our great staple articles, from periods of excessive investment or speculation, from wars and political disturbances, or other fortuitous occurrences which we cannot calculate upon and allow for." Still further developing the notion of periodicity, Jevons (*Political Economy*, 1878, Science Primers) says: "Good vintage years on the continent of Europe, and droughts in India, recur every 10 or 11 years, and it seems probable that commercial crises are connected with a periodic variation of weather affecting all parts of the earth, and probably arising from increased waves of heat received from the sun at average intervals of 10 years and a fraction."

The invention of this theory of "credit cycles" can be traced to Mr. John Mills, of Manchester (paper on "Credit Cycles and the Origin of Commercial Panics," *Transactions of the Manchester Statistical Society*, December, 1867). Mr. Mills discusses the pathology of crises; and after alluding to "the occult forces which swell or diminish the volume of transactions through a procession of years," thus speaks of periodicity:

"It is an unquestionable fact that about every ten years there occurs a vast and sudden increase of demand in the loan market followed by a great revulsion and a temporary destruction of credit."

A perhaps safer position is to say that while the cause of crises lies in the various motives which lead men to overspeculation, and in the psychological principles which make the act of one mind or of a few minds influence a whole community, so that overspeculation creates a general overspeculation, in the above-suggested ideas may lie the secret of crises returning so frequently about once in ten years. Many causes, however, may lead to crises. Macleod's *Dictionary of Political Economy* puts the causes of commercial crises as follows :

"1. A long-continued very low rate of interest. Persons in such times who have nothing but the interest of small capitals to live on are so strained in their means that they look out for more profitable investments. At such times wild speculators are sure to abound to take advantage of the credulous. One scheme breeds another, and a speculative fever seizes upon the public like a mania. Multitudes of schemes are set afloat for no other purpose than gambling in the shares. Numbers of persons then rush to buy the shares merely for the sake of selling them again, knowing full well that a crash must come, but hoping to make a lucky hit during the fever. Then, at last, either when calls come, supposing them ever to get to that stage, or when the circle of dupes is found to be exhausted, prices begin to waver and every one rushes to sell, and of course things fall as rapidly as they rose, and then comes the crash."

"2. When some new, large market is opened at home or abroad, in which extraordinary gains are realized by the first adventurers, numbers then rush in and over-production takes place, and the herd of adventurers is ruined."

"3. A great and general failure of some great crop necessary for subsistence. The enormously increased price deranges the demand for other things; the sudden rise of price tempts great speculation, sure to be followed by enormous disasters."

"4. A great derangement of the ordinary course of trade from some great general cause, such as the sudden commencement or the sudden termination of a war. The sudden cessation of demand for some articles deranges the calculations of the producers of them, and the sudden demand for large quantities of others raises their price suddenly, and gives rise to immense speculations in them, which are sure to be overdone and end in general ruin."

"Each of these causes separately, if on a sufficient scale, may produce a commercial crisis; but, as several of them may happen together, it will, of course, be proportionably intensified."

Of peculiarly monetary crises the Report of the United States Monetary Commission of 1876 gives a description from which we quote the following extracts :

"The worst effect, however, economically considered, of falling prices, is not upon existing property nor upon debtors, evil as it is, but upon laborers, whom it deprives of employment and consigns to poverty, and upon society, which it deprives of that vast sum of wealth which resides potentially in the vigorous arms of the idle workman."

Contraction of Money and Crises.

A shrinking volume of money transfers existing property unjustly, and causes a concentration and diminution of wealth. It also impairs the value of existing property by eliminating from it that important element of value conferred upon it by the skill, energy, and care of the debtors from whom it is wrested. But it does not destroy any existing property, while it does absolutely annihilate all the values producible by the labor which it condemns to idleness. The estimate is not an extravagant one that there are now in the United States 3,000,000 persons willing to work, but who are idle because they cannot obtain employment.

"Money capital, labor, and other forms of capital are the warp and woof of the economical system.

Labor, cooperating with the forces of nature, is the source of all wealth, and to reach the highest degree of effectiveness, it must be classified through the aid of capital and supported by capital during the process of production and be measured and paid in money, each unit of which is a sight draft on all other forms of property, bearing a value in proportion to the number of such drafts. In order that any country may reach the maximum of material prosperity, certain conditions are indispensable. All its labor, assisted by the most approved machinery and appliances, must be employed, and the fruits of industry must be justly distributed. These conditions are utterly impossible when the money stock is shrinking and the money value of property and services is declining. Howsoever great the natural resources of a country may be, however genial its climate, fertile its soil, ingenious, enterprising, and industrious its inhabitants, or free its institutions, if the volume of money is shrinking and prices are falling, its merchants will be overwhelmed with bankruptcy, its industries will be paralyzed, and destitution and distress will prevail. . . .

"The peculiar effect of a contraction in the value of money is to give profit to the owners of unemployed money, through the appreciation of its purchasing power, by the mere lapse of time. It is falling prices that robs labor of employment and precipitates a conflict between it and money capital, and it is the appreciating effect which a shrinkage in the volume of money has on the value of money that renders the contest an unequal one, and gives to money capital the decisive advantage over labor and over other forms of capital invested in industrial enterprises. Idle machinery and industrial appliances of all kinds, instead of being productive of profit, are a source of loss. They constantly deteriorate through rust and waste. They cannot escape the assessor and tax-gatherer as the bulk of money does, and must pay extra insurance when idle. Labor, unlike money, cannot be hoarded. The day's labor unperformed is so much capital lost forever to the laborer and to society. It being his only capital, his only means of existence, the laborer cannot wait on better times for better wages. Absolute necessity forces him to dispose of it on any terms which the owners of money may dictate. These are the conditions which surround the laborer throughout the commercial world to-day. The labor of the past is enslaving the labor of the present. At least that portion of the labor of the past which has been crystallized into money is enabled through a shrinkage of its volume and while lying idle in the hands of its owners to increase its command over present labor and over all forms of property, and to transform vast numbers of honest and industrious workmen into tramps and beggars. These laborers must make their wants conform to their diminished earnings. They must content themselves with such things as are absolutely essential to their existence. Consumption is therefore constantly shrinking toward such limits as urgent necessities require. Production, which must be confined to the limits indicated by consumption, is constantly tending toward its minimum, whereas its appliances, built up under more favorable conditions, are sufficient to supply the maximum of consumption. Thus idle labor, idle money, idle machinery, and idle capital stand facing each other, and the stagnation spreads wider and wider."

HISTORY OF CRISES.

In 1634 there was a crisis over tulips which became a *furor* in Holland. This mania lasted four years before it burst. But the first crisis of the modern type occurred in 1720 over the speculative plans of John Law in forming his Mississippi Company. His company possessed in 1719 over 21 ships and nearly \$1,000,000. Shares went up to many times their value. Speculation developed like a fever in France and England. In France the currency was inflated. The fall **Early Crises.** was precipitate. About the same time, too, in England was developed the South Sea Bubble (*q. v.*). Various companies united into one South Sea Company, but they were largely fraudulent, and the leading to great speculation, soon utterly failed. In 1763 and 1799 there were crises in Hamburg. In

England there were crises in 1783, 1793, 1795-1797, in connection with the American and French wars. In 1815 there was a severer crisis at the close of the Napoleonic wars. Hitherto the French ports had been closed to England. After the peace England undertook to flood Europe with manufactures. But there was "over-production" (*q. v.*) and a crisis. In 1825 there was another crisis, an account of which, together with the accounts of the next succeeding crises, so far as they concern England, we abridge from the account by G. H. Pownall in Palgrave's *Dictionary of Political Economy*. It was one of the most severe:

"At this date speculation ran very high, for the most part in loans and mining adventures, and other investments abroad. The foreign exchanges were so much depressed as to be the cause of a nearly continuous drain on the bullion of the bank. This foreign drain, Tooke remarks, was not counteracted by any operation of the bank; it was suffered, he observed, to run its course, till it ceased of its own accord, that is by

Crises of 1825.

simple efflux, toward the close of the summer. Many and heavy banking failures, and a state of commercial discredit, preceded and formed the earlier stage of the panic. The tendency to speculation, and the undue extension of credit, was preceded, probably caused, and certainly favored and promoted, by the low rate of interest which had existed for some time previously; and this low rate of interest was apparently prolonged by the operations of the Bank of England. Facility of banking accommodation, which had existed for some time previously, favored undue extension of credit.

"This gradually led on to the great difficulties of the year.

"In the summer of 1822 the bank reduced its rate of discount from 5 to 4 per cent.

"The great severity of the pressure extended over a very short time, hardly more than three weeks. Some banking failures, principally in the provinces, in the month of December, were followed by the failure of several banks in London. A severe drain on the resources of the Bank of England took place. The accidental discovery, for such it was said by Mr. Harman in his evidence in 1832 (Bank Charter Report, 1832) to have been, of an amount of £1 notes which had been put away in the bank was, doubtless, a fortunate circumstance; for altho the sum was not large (between £700,000 and £800,000), it served to meet the peculiar difficulty of that time, which consisted in an extensive distrust of the small note country circulation, and it is probable that it had an immediate and very great effect in stopping the demand from the provinces for gold." (Tooke.)

"Tooke describes the spirit of speculation aroused as follows: 'This possibility of enormous profit by risking a small sum was a bait too tempting to be resisted; all the gambling propensities of human nature were constantly solicited into action; and crowds of individuals of every description—the credulous and the suspicious, the crafty and the bold, the raw and the experienced, the intelligent and the ignorant; princes, nobles, politicians, placemen, patriots, lawyers, physicians, divines, philosophers, poets, intermingled with women of all ranks and degrees (spinsters, wives, and widows)—hastened to venture some portion of their property in schemes of which scarcely anything was known except the names.'

"The recoil from these speculations was inevitable. The country banks, whose advances and whose issues of notes had both exceeded the limit of prudence, were among the principal sufferers. Several London banks likewise failed. A remark made by Mr. Huskisson, "that we were within a few hours of a state of barter," has often been quoted as showing the severity of the trial the country passed through. The turning-point appears to have been in the week ending Saturday, December 27, 1825. On that day, according to a statement made by Mr. Richards, then deputy governor of the bank, "whether from fatigue, or whether from being satisfied, the public mind had yielded to circumstances, and the tide turned at the moment on that Saturday night." The greater part of 1826 was a time of considerable depression, but by 1827 the trade and manufactures of the country had resumed their usual and steady course."

The crisis in America was at its height in 1826. In July metal had disappeared from the banks. Discount rose from 20 to 30 per cent. By August failures were general.

The monetary disturbances of 1836-37 are not included by Tooke among the memorable commercial crisis. "It was confined in a great measure to two branches of trade, the American and East Indian, including China. The Bank of England raised its rate of discount to 5 per cent., and laid some restriction upon the bills of the American houses, who were notoriously overtrading."

But in the United States this crisis was most severe. Early in 1836 President Jackson counseled an increase of circulation at the expense of small notes, and gold began to come to America; but by the above-mentioned action of the Bank of England credit was withheld, and failures in this country became numerous. Gold in 1837 went back to England, and the crisis in the United States was general. Seven hundred banks stopped payment.

It was the worst period since the Revolutionary War. Early in 1838 there was prosperity again, but a crisis breaking out in France and Belgium, with a great draft of gold from the Bank of England, which came near stopping specie payment, the crisis in the United States became still more formidable. On October 10 the United States Bank (see BANKS AND BANKING) was compelled to close its doors. In 1839, 959 banks stopped payment. There were 33,000 failures, with a loss of \$440,000,000.

The crisis of 1847 affected England more. The failure of the potato crop in 1846 caused the need for a heavy importation of corn. "The price of corn was very high in 1847, the average in May being 92s. 10d.

per quarter, but the imports rose in proportion. The result was the failure of many houses in the corn trade, which became the signal for other heavy bankruptcies. Several banks succumbed, and credit was severely shaken."

Meanwhile the anxiety and alarm were causing hoarding, and it appeared not unlikely that the banking department of the Bank of England might be compelled to stop payment while there was more than £6,000,000 of specie in the issue department. Some of the leading city bankers had an interview with the prime minister, and the desired relaxation was given. The official letter recommended "the directors of the Bank of England, in the present emergency, to enlarge the amount of their discounts and advances, upon approved security." A high rate, 8 per cent., was to be charged, to keep these operations within reasonable limits; a bill of indemnity was promised if the arrangement led to a breach of the law. The extra profit derived was to be for the benefit of the public. No really adequate reason has ever been given for this last stipulation, unless it is supposed to have been made to prevent the bank from maintaining the extra rate unduly long.

The effect of the Government letter in allaying the panic was complete. When anxiety as to obtaining bank notes or gold was removed, the immediate pressure shortly disappeared.

The crisis of 1857 began in America. New

Crises of 1847.

companies had been forming in all directions. There was an unusual importation of European goods. The banks were unable to resist the monetary pressure, and on August 24 they stopped payment; 5123 failures were counted, with liabilities of \$299,000,000. The enormous fall of values, however, brought back gold, and by January, 1858, most of the banks had resumed. It affected England later, but most severely. The suspension of the Bank Act of 1844 eased the market somewhat, but the industrial crises were even more marked. Hundreds of thousands of workmen were unemployed. Riots became frequent. The crisis passed, but then gradually reached successively France, Germany, the Scandinavian States, Austria, Italy, South America.

The crisis of 1861 affected England in January and France in the autumn, and was brought on by England's having to pay a heavy balance in favor of the United States. The rate of discount in France had to rise to 8 per cent. to bring back cash.

The crisis of 1866 was mainly in England, once more causing a suspension of the Bank Act, and was marked by the memorable "Black Friday" and of the failure of the almost historic house of Overend, Gurney & Co. September 23, 1869, saw a "Black Friday" in New York, but it was mainly local and connected with gold speculation.

During the first three quarters of 1873 the general prosperity of the United States seemed undiminished; but on September 18, 1873, the most extraordinary panic began which this country has ever witnessed, and reached its height about the middle of October. It prostrated thousands of commercial houses, cut off the wages of hundreds of thousands of workmen, and overthrew the Stock Exchange. It swept down the entire banking system of the country. Even savings banks closed their doors. It broke off the negotiation of American securities in Europe, and prostrated business in every way. The causes were involved.

The closing of the War of the Rebellion had seen the commencement of great industrial activity in the United States. From 1869-73 enormous amounts of money were invested in commercial enterprises. The cost of the railroad construction of those five years is estimated at \$1,700,000,000, while municipalities and private corporations borrowed money for vast undertakings. The land grant policy and cheap transportation developed a new West. In Europe the opening of the Suez Canal stimulated commerce. Interest was based on the high prices of war time. There was increased need of currency. Instead of this the policy of resumption and contraction (see CONTRACTION AND EXPANSION OF CURRENCY) limited the amount of currency below the demand. Prices fell, whether owing to contraction of currency or cheaper processes of production is a disputed point. (See BIMETALLISM.) Both causes were probably at work. But it is not disputed that

prices fell. Heavy crops and an unusually large demand for money precipitated the impending crisis. September 18 the great house of Jay Cooke & Co., of New York, failed. This brought trouble to Fish & Hatch, and to McCulloch of London. The worst immediate effects of the crisis were soon met. The bankers met and voted: 1. To issue \$10,000,000 loan certificates, and still later \$10,000,000 more. 2. A general movement on the part of the banks to make large payments in checks only, certified as "good through the Clearing House." 3. Purchase of bonds by the Treasury amounting to \$13,500,000, which liberated an equal amount of legal tenders. 4. The advantage taken by the savings banks of the thirty days' notice of withdrawals by depositors. 5. The closing of the Stock Exchange from the 20th to the 30th of the month. Great pressure was brought to bear upon the United States Treasurer to afford relief by issuing United States notes; but he declined, and only consented to sell \$13,000,000 bonds.

The immediate crisis was stayed; but in industrial lines 1874 was worse than 1873, and there was depression till 1877. The great railroad strikes of that year made matters worse. In 1878 there was improvement, and this continued till 1883. In 1884 another crisis occurred, tho of less serious character, and depression continued through the strikes and industrial troubles, which continued till 1886. Confidence was then in a degree restored, and with some depression in 1888, till the crisis of 1890. That year prominent English houses which had invested in Argentine Republican and African securities were disturbed, and finally on December 15 even the great house of Baring Brothers suspended. In France the great coffee syndicate failed. But the Bank of England stood firm, and a syndicate of strong houses liquidated the debt of Baring Brothers. It affected the United States almost as much, tho not so much in the form of a crisis as of adding to depression, continuing without much improvement to the great crisis of 1893.

The crisis of 1893 was in many ways different from all other crises. It was only very slightly due to overspeculation, almost purely to monetary conditions, yet it affected not only financial circles, but industry all over the United States. Early in the year there was widespread financial unsteadiness, with securities on the down grade. In Congress there was discussion over the repeal of the silver-purchasing act of 1890. (See CURRENCY.) During May and June there was no improvement, tho, with the exception of the National Cordage Company, no important houses were seriously affected. June 26, however, it was announced that India had stopped the free coinage of silver. It at once sent the price of silver bullion down to the lowest point ever recorded, and all stocks went down. The mines of Colorado and other silver States were at once stopped and their workmen left unemployed. There was a panic. Western and Southern banks began to fail. Hoarding set in, even in the East. Currency became scarce. Many manufactories shut down. Even strong manu-

facturing companies could not get change to pay their men. Wealthy men with unquestioned credit could not get checks cashed. All the banking centers except Chicago began to have recourse to clearing-house certificates. In New York during the summer these certificates reached the sum of \$38,280,000. Early in August bank and treasury notes commanded a premium as high as 4 per cent. in New York. There was a money dearth. The President called an extra session of Congress, which opened August 7. It was claimed by the monometallists that the money panic was caused by a lack of confidence in the United States monetary policy, from fear that, the silver was depreciating, the United States would be committed to depreciated silver. In the House a bill was therefore introduced by Mr. Wilson, according to the suggestion of the President's message, repealing the silver-purchase bill, the renewing the pledge to maintain the parity of gold and silver at the existing or some other ratio. On the other hand, it was claimed by the free-silver men that the financial crisis was caused by the lack of money resulting from the purpose of the gold manipulators to drive silver from the world, enhance the value of gold, and increase their profits. It was claimed that ever since 1873 this policy had resulted in a contracted currency, low prices, suffering for the debtor classes, stoppage of manufactories, etc., a long depression, and that now by a last stroke the crisis had been brought on by the bankers trying to drive silver completely from the market. The conflict was bitter in Congress and through the country, the sentiment of the West and South being bitter against the capitalistic East. Finally, August 28, the Wilson Bill was carried by a vote of 240 to 110, and the silver-purchase clause repealed. Then began a still more heated struggle in the Senate. Not till October 30 was a bill introduced by Senator Voorhees repealing the silver-purchase law, but declaring for the parity of gold and silver in stronger terms, substituted for the Wilson Bill passed by the Senate by a vote of 43 to 32, accepted by the House by a vote of 192 to 94, and signed by the President November 1.

Meanwhile the crisis was already checked. By the middle of August confidence began to return. By September the premium on currency vanished. Foreign investors began sending in money, taking advantage of the low price of stocks. Only one private banking firm in New York City had failed and only one national bank. Of the 301 bank suspensions from May 1 to July 22, 93 per cent. were in the South and West. Yet the business failures from April 1 to October 1 were 8105 against 4171 for those months in 1892, with liabilities of \$284,663,624 against \$41,110,322 for 1892. Thus the number of failures had doubled and the liabilities had increased nearly sevenfold. Three great railway systems were sent into the hands of receivers: the Northern Pacific, the Union Pacific, and the Erie. For further details of this crisis and for references, see CURRENCY. For various other views as to the causes of crises, see articles SILVER QUESTION; CONTRACTION AND EXPANSION OF CURRENCY; MONOMETALLISM OVER PRODUCTION; SOCIALISM.

CRUSADES, SOCIAL EFFECT OF.—The crusades covering the interval from the eleventh to the thirteenth centuries, and partly inclusive of these, exercised the most profound influence upon Europe; not only upon those directly engaged, but upon popes, kings, and emperors; upon the relations of Church and State, and upon the development of literature, education, and art. Classes were broken up, and nations were brought together. The economic conditions of Europe were changed. The decay of the Western empire had broken off the intercourse between the East and West, and completely ended the maritime traffic which had been begun by the Phœnicians. It was this destruction of naval commerce that compelled the Crusaders to march overland to Asia. The crusades revived the trades of ship-building and merchandising, and dotted the Mediterranean with sails. Asia Minor exchanged products with Norway and Sweden. An enormous impulse was thus given to manufactures and agriculture. Neglected industries were developed, and new arts and occupations introduced from the East. The crusaders learned in Greece the manufacture of silk, in Tyre the art of glass-making, in Africa the cultivation of maize and sugar-cane, and in Damascus the working of metals and making of cloth. Manufactures necessitated the growth of large towns, which was one of the most notable results of the crusades. Great wealth, with all its good and evil consequences, began to flow into the cities of Italy, Germany, France, Flanders, and other European countries.

CUNNINGHAM, WILLIAM, is best known in economic thought as the leading English advocate of the historical or empirical study of social phenomena. Graduated from Trinity College, Cambridge, in 1873, and ordained the same year, he devoted his early years mainly to historical, theological, and ecclesiastical studies. Deputy to the Knightsbridge professor, 1881, and since 1887 Vicar of St. Mary's the Great, Cambridge, he has given his later years largely to economic history. In 1882 appeared the first edition of his important work, *The Growth of English Industry and Commerce*, which Professor Ashley (*q.v.*) calls the first attempt that had been made to trace the whole course of English economic development. He has since developed this book into a practically new work, the first volume of which appeared in 1890 and the second in 1892. In 1884 he published his *Christian Opinion on Usury*; in 1885, *Politics and Economics, an Essay on the Nature of the Principles of Political Economy and a Survey of Recent Legislation*; in 1886 *S. Austin and his Place in the History of Christian Thought*; in 1887, *Political Economy Treated as an Experimental Science*; in 1891, *Use and Abuse of Money*. In 1891 he was made Tooke Professor of Political Economy at King's College, London, and also elected to a fellowship at Trinity, Cambridge. He is a D.Sc. of Edinburgh and D.D. of Cambridge.

CURRENCY.—(See also MONEY; BANKS AND BANKING; GOLD; SILVER; BIMETALLISM; MONOMETALLISM; PAPER MONEY; CONTRACTION AND EXPANSION OF CURRENCY; CRISES; MONETARY CONFERENCES; GREENBACKISM, etc.) The word currency may be defined as money in *circulation*, or the commodity or commodities in use in any country as the medium of exchange. Money (*q.v.*) is the general and philosophic term; currency is money, with emphasis upon its passing from hand to hand. For a statement, therefore, of the economic principles and different theories of money, see MONEY. We present here an historical review of the

UNITED STATES CURRENCY,

our main authorities being, for the earlier periods, Professor Sumner's *History of American Currency*, and Bolles' *Financial History of the United States*; for the later periods, the reports of the Secretary of the Treasury, the Comptroller of the Currency, the Director of the Mint, and the Record of Political Events in the *Political Science Quarterly*.

I. COLONIAL PERIOD.

From Professor Sumner we learn that the first colonies to this country brought little English or European currency with them, and soon found need for more.

Winthrop wrote to his son in 1630 especially to bring £150 of £200 with him. A married clergyman in those days was allowed £30 per annum. Carpenters and skilled workmen, who were greatly in demand, were forbidden to take over 1*sd.* and later 2*s.* per day. When explorers reached Long Island Sound, they found the Indians more advanced in civilization than their northern neighbors, and using a circulating medium of exchange, consisting of beads of two kinds, one white, made out of the end of a periwinkle shell, and the other black, made out of the dark part of a clam shell. They were rubbed down and polished, and when artistically arranged in strings or belts formed objects of real beauty. These beads circulated among the Indians as money, one black bead being reckoned as worth two white ones, and were known as *wampum*, or *wampumpeag* or *peag*. The colonists came to use them first in their trade with the Indians, and then among themselves. In Massachusetts they became by custom the common currency of the colony, and were made a legal tender in small sums. "The white man," says Professor Sumner, "also proved his superiority by counterfeiting it." A fathom or belt of wampum consisted of 360 beads, and one fathom of white would buy furs valued at 5*s.* sterling. Barter was also at this time continually used, and various commodities did duty for money. In 1635 musket bullets were used for change at a farthing apiece. And the more barter was used because money was scarce, the scarcer money became. Interest in 1664 was 8 per cent. Merchants drained the people of their cash. In 1652 Massachusetts set up a mint to coin silver—the famous "pine tree" coinage. She coined shillings, sixpences, and threepences. The coins were to be of sterling alloy $\frac{1}{4}$ fine, and the shilling worth 1*0d.* sterling. It was taken in England at 25 per cent. discount, and declared to be not of even weight or fineness. Barter, however,

Pine Tree Coinage.

continued. Silver was smuggled out of the country or clipped. The silver which came to the colony consisted mainly of Spanish pillar coins. They were not allowed to be circulated. In 1686 a bank was proposed, and seems to have made issues, but soon disappeared. Andrews stopped the mint about 1688. The first enduring issue of paper money made in the colonies was in 1690, six years before the founding of the Bank of England.

An expedition had been sent out against Canada, and returning without spoils, and in a state of misery, the soldiers were clamorous for their pay. So £7000

were issued in notes from 5*s.* to £5. The form of these notes or bills was as follows:

"This indented bill of 10*s.*, due from the Massachusetts colony to the possessor, shall be in value equal to money, and shall be accordingly accepted by the treasurer and receivers subordinate to him in all public payments, and for any stock at any time in the treasury." The soldiers disposed of them at one third discount till 1692, when the Government ordered that they be received at 5 per cent. advance over coin, and promised to redeem them in money within 12 months. This kept them at par 20 years. There were continually at every new crisis new issues of money. Another expedition against Canada in 1700 meant a new large issue. Connecticut and most of the colonies also issued a small amount. South Carolina probably issued more money than any other colony. In 1709 the time for redemption in Massachusetts was set at four years and then later, and the paper began to depreciate. In Connecticut there were four prices for "pay," "pay as money," "money," and "trusting." "Pay" was barter at Government prices. "Money" was Spanish or New England coin. "Pay as money" was barter currency at prices one third less than the Government rate; "trusting" was an enhanced price according to time. The merchant asked his customer how he would pay before fixing his price.

In 1715 John Colman proposed a land bank, which in those days meant simply an issue of paper based on land. Such an issue was made. Banking was arresting attention the world over. The Land Bank of England dates from 1685, the Austrian enterprises from 1700, John Law's scheme from 1715, and the South Sea Company from 1711. In 1720 trade was stagnant, and there was a great cry for more issues. At the same time the commissioners of the New England colonies became alarmed at the tendency to further increase of paper notes. The English Parliament forbade bank-

Land Banks.
ing except under its charter, and forbade the colonial governments from emitting bills. Later the restriction was modified to permit an issue for government expenses only. In 1739 a "land bank" was set in operation, which loaned its notes for 3 per cent. per annum interest, and 5 per cent. in principal, *both payable in merchandise*. This bank became a factor in politics, and as fortunes were to be made through it, the "land bank," says Sumner, "resisted its fate by social and political intrigues." In 1740 Parliament required its wind up, but it managed to evade the requirement.

Rhode Island had the severest experience, as it issued bills the most recklessly. Parties were no longer Whig or Tory, but Creditor and Debtor. In 1721 Massachusetts issued £100,000, and forbade buying or selling silver; but this could not be stopped. It led to the above-mentioned instructions from Parliament to forbid the governors signing any acts for emitting bills, and the history of the next 20 years is a history of struggle over this. In 1749 the paper issue of Massachusetts was £2,466,712. Parliament at this time ransomed Louisbourg from the colonies, and paid Massachusetts in silver and copper £138,649 sterling, which at 11 to 1, the ruling exchange, nearly cancelled the paper, and Massachusetts found herself with a specie currency. Other colonies, and Rhode Island in particular, clung longer to paper money.

2. TO THE WAR OF THE REBELLION.

We now come to the times of the Revolution. The colonies commenced the war, many of them with paper already in circulation. To issue paper money was the one way in which they were accustomed to meet a crisis. The Continental Congress ordered in May, and issued in August, 1775, paper for 300,000 Spanish dollars, on the faith of the "Continent," redeemable in three years in gold and silver. This went on till \$9,000,000 were thus issued. In 1776 depreciation began. In 1779 Congress was at its wits' end. It tried to force paper money into circulation by making it legal tender, and by fixing prices, but this only increased depreciation. In 1780 the bills were worth only two cents on the dollar. The following table, con-

densed from Gouge's *History of Continental Money*, gives the issues and depreciation :

Added in	1776	\$20,064,464
"	1777	26,426,333
"	1778	66,965,269
"	1779	149,703,856
"	1780	82,198,320
"	1781	11,408,095
Total,		\$357,476,541

Amount issued up to and inclusive of the year—

{ Rate of exchange }	Jan. 1, 1777	1¼ for 1
{ for gold or silver }	" 1778	4 "
"	" 1779	9 "
"	" 1780	45 "
"	" 1781	100 "
"	" 1782	500 "

The French alliance in 1779 enabled Congress to borrow money, and it attempted to limit the outstanding issues of paper money to \$200,000,000, but did not. The loss of value of the entire issue became complete in 1781, and having been gradual, as it passed from hand to hand through several years, came to be regarded in the light of an involuntary tax for the maintenance of the war, which in general had fallen severely on people, according to their means, tho in cases it produced shameful wrongs. Nevertheless,

of this depreciation of the continental paper money, it should be added that it struggled against fearful odds. Congress issued the bills, but only the individual States could redeem them. Congress collected no duties on imports or internal revenue. For Congress it was all outgo and no income. The continental money was made payable in coin which was at a premium. The wonder is that it circulated as well as it did.

The colonies were contending with the greatest nation on earth, whose armies had generally been victorious on land, who was conceded to be the mistress of the seas. The colonies were poorly prepared for war. They had no army, no navy, no fortifications, no arms, no ammunition, no credit, no money. The odds were immensely against them, viewed from a military standpoint. The contest was not only doubtful, but from any standpoint except justice and right was overwhelmingly in favor of Great Britain. Under these circumstances it would have been difficult to maintain a State paper circulation at par had Congress adopted the best method of doing it. But with the means adopted, it is astonishing that any success attended their efforts. So that, while the continental paper money must be admitted to have failed, small argument can be drawn from it as to the failure of such money under proper conditions. But the real currency of this period was the note circulation of banks, under either national or State charters, altho some metal was coined. For a fuller consideration of this period, we therefore refer the reader to the article BANKS AND BANKING.

In January, 1782, the Bank of North America was chartered in Philadelphia, with a capital of \$400,000. Seventy thousand dollars in specie were put into its capital by citizens, and the remainder by the Government in specie or foreign exchange out of a foreign loan. The bank had its origin in a union of citizens to supply the army. They issued the bank's notes in pay. Gouge, in his *History of Paper Money and Banking in the United States*, published in 1833, shows that it was a mistake to suppose that that bank aided the

Government, as its stockholders only paid in \$70,000, or seven-fortieths of its capital. The Government deposited \$254,000, and was credited by Robert Morris with that amount of stock in the bank. The individual directors thus acquired the power to circulate \$400,000 in the bank's notes, and loaned the Government and others their own money and the \$400,000 additional money which the Government's deposits and sanction soon made current at par. The dividends were soon from 12 to 16 per cent. for the stockholders. "In 1785," says Gouge, "the effects of its operation began to be apparent. . . . A temporary plentifulness of money, followed by great scarcity, usury, ruin to the many, riches to the few." In 1785 the Legislature of Pennsylvania repealed its charter, but it existed under its old congressional charter till Pennsylvania finally rechartered it. In 1785 and 1786 Shay's rebellion broke out in New England. It was an insurrection of debtors who were suffering from a collapse of the currency and return to specie values. They clamored for paper. The rebellion was put down by force ; but Massachusetts passed a law delaying the collection of debts. In Rhode Island the Paper Money Party carried the election of 1786, and £100,000 were issued by vote of the rural districts against the cities.

The new federal Constitution, framed in 1787, had decreed that no State "shall coin money, emit bills of credit, or make anything but gold and silver coin a tender in payment of debts ;" and this would seem to have forever barred a State from giving charters to banks of issue, since it would seem that a State Legislature could not delegate to private corporations a power the Constitution had denied to the State itself. Nevertheless, the rage for banking became so extreme, excited largely by the high profits of the Bank of North America, that Massachusetts, New York, and Maryland gave charters to banks which United States courts did not abrogate. The Bank of North America had already been chartered, and it was held that "bills of credit" were not meant to cover bank-notes. The courts have held that a State may authorize bank issues when it itself owns all the stock ; when the Legislature appoints the directors ; when the faith of the State is pledged for the redemption of the bills, and when they are receivable for public dues, provided also that the capital is paid in and the bank may be sued (Story, fourth edition, vol i., p. 227, note). On the question, Can the national Government do what the States cannot do under this clause ? the courts have decided that it can.

When it was proposed, however, in the constitutional convention to give to Congress the right to emit bills of credit, it was defeated by a vote of nine States to two.

United States Banks.

Thus began the great flood of State banking, which did not terminate till the War of the Rebellion. (See BANKS AND BANKING.) The first United States bank was chartered in 1791, and expired in 1811. The second United States bank was opened January 1, 1817, and finally suspended February 4, 1841. The Secretary of the Treasury began to interfere with the bank market directly about 1814. (For the whole struggle of the Government and of the State banks against the national bank, and for the effect of the national and State bank issues upon the currency, see BANKS AND BANKING.) In 1786 Congress passed a coinage law upon a plan presented by Thomas Jefferson.

The Constitution (Article 1, section 8, clause 5) had vested in Congress the right to coin money and to regulate the value thereof, and the Act of Congress of April 2, 1792, was the first act respecting coinage, entitled "An act establishing a mint and regulating the coins of the United States." The ninth section of this act provided:

"That there shall be from time to time struck and coined at the said mint, coins of gold, silver, and copper of the following denominations, values, and descriptions, viz.: Eagles—each to be of the value of \$10 or units, and to contain 247 grains and four eighths of a grain of pure, or 270 grains of standard gold."

After providing for half eagles, each to be of half the value of the eagle, and quarter eagles, each to be of one fourth of the value of the eagle, the section continues, as follows:

"Dollars or units—each to be of the value of a Spanish milled dollar as the same is now current, and to contain 371 grains and four sixteenth parts of a grain of pure, or 416 grains of standard silver."

The act also provided for half dollars, quarter dollars, dimes, and half dimes, each to contain, respectively, one half, one fourth, one tenth, and one twentieth of the pure silver contained in the dollar. The coinage of cents and half cents of copper was also provided for.

It thus declared the dollar to be the unit of value, and it measured this value in silver.

The money unit of the United States had been already established in 1785 by the Continental Congress as the dollar. This was a well-known coin, and had been in constant use for many years. Indeed, it com-

Adoption of a Currency. peted with the pound as a measure of value; in some transactions the pound measure was used; in other transactions the dollar measure.

Persons expressed their transactions in their books of account either in pounds or dollars; but for a long period the quantity coined was so small that it was necessary to use foreign coins for monetary purposes. Congress first authorized their use in 1793, declaring at what rates they should pass current, and that they should be a legal tender for the period of three years from the time the mint began operations. When that time expired their use was renewed by additional legislation for short periods until 1809. To determine their value, they were assayed annually, and from the information thus obtained Congress could act intelligently in fixing the rates. After the supply of domestic coin became ample, foreign coins ceased to be used much as money, tho, as they were mingled with the domestic coinage, they were to be constantly seen until the suspension of specie payments in 1861, when all coin disappeared.

By the act of 1792 the proportion of pure gold to the alloy in gold coins was made by this act, 11 parts gold and one part alloy, the alloy being composed of

silver and copper. The proportion of pure silver to the alloy in silver coins was made 1485 parts fine silver to 179 parts alloy. The reason for this proportion of silver to alloy was that the alloy was found in that proportion in the Spanish dollars then current. These coins having been a long time in circulation were more or less worn, and their assay did not show the exact original weight of the coin, and probably not the exact original proportion of alloy. The alloy in the silver dollar consisted of 44 $\frac{1}{2}$ grains of copper, making the dollar 892.25 fine; this, by the act of 1837, was changed to 41 $\frac{1}{2}$ grains of copper, making the standard nine tenths fine. Section 11 of the act provided:

"That the proportional value of gold to silver in all coins which shall by law be current as money within the United States, shall be as 15 to 1, according to quantity in weight of pure gold or pure silver; that is to say, every 15 lbs. weight of pure silver shall be of equal value in all payments with 1 lb. weight of pure gold, and so in proportion as to any greater or less quantities of the respective metals."

A dollar of gold contained 24.75 grains of pure metal, and a dollar of silver 371.25 grains—being exactly 15 to 1. Section 14 provided:

"That it shall be lawful for any person or persons to bring to the said mint gold and silver bullion, in order to their being coined; and that the bullion so brought shall be there assayed and coined as speedily as may be after the receipt thereof, and that free of expense to the person or persons by whom the same shall have been brought. And as soon as the said bullion shall have been coined, the person or persons by whom the same shall have been delivered shall, upon demand, receive in lieu thereof coins of the same species of bullion which shall have been so delivered, weight for weight, of the pure gold or pure silver therein contained."

Section 16, which follows, made the coinage of both metals equally a lawful tender in all payments whatsoever, thus establishing the free coinage and full legal tender of both metals without limit, at the ratio of 15 to 1. The exact language of section 16 of the act is:

"That all the gold and silver coins which shall have been struck at, and issued from the said mint, shall be a lawful tender in all payments whatsoever; those of full weight according to the respective values hereinbefore declared, and those of less than full weight at values proportional to their respective weights."

The ratio of 15 to 1 for American coins was not exactly in accordance with the ratio which then prevailed in European countries. Silver was slightly overvalued and gold a little undervalued.

The result was that the metallic money of the United States during this period consisted mostly of silver coins and largely of foreign coins. But \$11,908,800 of gold altogether were coined from 1793 to 1834, and this was generally soon exported. The production of gold for the same period in the United States is given at \$4,000,000.

The act of May 8, 1792, provided for the purchase of copper, "not exceeding 150 tons," "to be coined into cents and half cents," which, by the act of April 2, 1792, were to contain respectively 11 and 5 $\frac{1}{2}$ pennyweights. The act of January 14, 1793, provided that the cent piece should contain 208 grains of copper and the half cent 104 grains.

The act of February 9, 1793, prescribed the rates at which foreign gold and silver coins should be legal tender in the United States. This act provided that Spanish milled dollars should be legal tender "at the rate of 100 cents for each dollar, the actual weight whereof shall not be less than 17 pennyweights and 7 grains." Section 2 of this act provided, "That at the expiration of three years next ensuing the time when the coinage of gold and silver, agreeably to the act entitled 'An act establishing a mint and regulating the coins of the United States,' shall commence at the mint of the United States (which time shall be announced by the proclamation of the President of the United States), all foreign gold coins and all foreign silver coins, except Spanish milled dollars and parts of such dollars, shall cease to be a legal tender, as aforesaid."

Section 5 of the act of March 3, 1795, provided for the deduction of two cents per ounce from deposits of silver bullion when below the standard of the United States and four cents per ounce from gold bullion below the standard to cover the cost of refining.

Only the copper, however, at this time was coined, and, being below standard, depreciated. They bore 13 circles linked together, with a small circle in the middle, around this the words "United States," and in the

15 to 1.

centre "We are one." On the opposite a sun-dial with the words "Fugio" and "1787" on either side, and "Mind your business," below the dial. The real currency of the United States at this time consisted mainly of bank notes, nominally convertible, issued by chartered banks. In 1794, the first silver was actually coined, the dollar weighing 416 grains, 1485 parts pure to 1790 parts alloy. Gold was first coined in 1795, the eagle weighing 270 grains, $\frac{1}{4}$ pure, so that one dollar contained 24.75 grains pure gold. It was assumed that silver was to gold as 15 to 1, but the actual market value was $15\frac{1}{4}$ to 1. With slight amendments the above was the coinage to 1834, when there was a change.

Currency Changes.

The act of June 28, 1834, changed weight and fineness of the gold eagle, making it 258 grains of .899225 fineness, or 232 grains of pure gold. No change was made in our silver coins by the act of 1834. Why the ratio should have been changed at this time from 15 to 1, as established in 1792, to 16 to 1, 31 years after the French act of 1803, which had practically fixed the ratio for all Europe at $15\frac{1}{2}$ to 1, is difficult to understand. The reason usually given is that under the ratio of 15 to 1 little or no gold came or stayed here, and new mines of gold having been discovered in North Carolina and Georgia about this time, the higher ratio was adopted in order to give the gold a higher rating relatively to silver, and thereby keep it here.

But it worked evil, and the act of January 18, 1837, established .900 as the standard fineness of both gold and silver. It left the weight of the gold dollar unaltered (thus slightly increasing its value) and reduced the weight of the silver dollar to 412½ grains.

Between the act of 1792, establishing the mint, and the act of 1837, no change whatever was made in the silver coins, and the only change made in these coins by the act of 1837 was the change in the alloy from 44½ grains, as contained in the dollar of the act of 1792, to 41½ grains, the pure silver being left the same exactly by the act of 1837 as it was in the original act of 1792. The pure gold was changed from 24.75 grains to a dollar, as in the act of 1792, to 23.22 grains, as fixed in the act of 1837. As $37\frac{1}{4}$ grains is the weight of pure silver in our present standard dollar, it will be seen that this unit has therefore never varied in weight of pure metal through all the changes of our mint laws. It stands today the same dollar it was when our money system was established.

The change in the ratio to 16 to 1, in 1834, while the European ratio stood at $15\frac{1}{2}$ to 1, led to the exportation of nearly all our full-weight silver coins. For, by this variation in the ratio between the two metals in the United States and in Europe, full-weight silver coins were worth for export a little more than 3 per cent. more than our gold coins; and as our subsidiary coins contained proportionally the same weight of pure silver contained in the dollar piece, it was as profitable to export these coins as the dollar piece; and consequently the country was well-nigh depleted of small coins. To remedy this evil, Congress by the act of February 21, 1853, reduced the weight of the half-dollar from 206½ grains to 192 grains standard silver, and the smaller silver coins in proportion. Until this act fractional silver coins were legal tender for all sums; but by this act they were made legal tender for \$5. only. Deposits of silver for coinage into fractional pieces for the benefit of the depositor were no longer received, but provision was made for the purchase of silver bullion on government account for the fabrication of the light-weight subsidiary coins.

Passing by legislation concerning foreign coin (which by the act of February 21, 1857, was deprived of currency) and concerning minor currency, we now reach the period of the War of the Rebellion. Yet it must not be forgotten that through all this period the currency of the country was really very largely the bank notes, and that the great currency problems and movements of the day were connected with the banks and the battle of the various administrations for or against the national and State banks. (For all this interesting period, however, see BANKS AND BANKING.)

3. THE PERIOD OF THE WAR OF THE REBELLION.

At the breaking out of the Rebellion, the Government found itself destitute of the means

necessary to carry on a gigantic war, and unable to procure such means from ordinary sources. Salmon P. Chase, of Ohio, had been nominated Secretary of the Treasury by Mr. Lincoln, and after much hesitation had accepted. He was without experience, but trusted by the people. He had a difficult problem to meet. Howell Cobb had worked under the preceding administration to ruin the credit of the Government, and the General J. A. Dix, after Mr. Cobb's retirement, had done his best, he had had to borrow at 12 per cent. interest, and raised only \$5,000,000 of treasury notes at that.

Mr. Chase first negotiated some small loans under the authority already existing, and on July 4, 1861, Congress convened to enact measures for suppressing the war. A loan of \$250,000,000 was authorized, duties were increased, an internal revenue system was adopted, and a direct tax of \$20,000,000 was laid. The States were offered 15 per cent. reduction if they paid the tax, and this course was taken by all the States except those in rebellion, Delaware, and two of the territories, altho much of the money was paid by fitting out troops, and brought in no revenue to the general Government. Tax commissioners were appointed to enforce the law in the insurrectionary States, and they made levies and sold land, and after a long effort collected a portion of the tax assessed on them.

As soon as Congress adjourned, Mr. Chase went to New York to effect the loan, obtaining a promise of \$150,000,000. Subscription books for a "popular loan" were opened and brought in \$24,678,866, and the banks agreed to make up the rest. The thought was naturally in people's minds, What if we do not support the Government?

The banks proposed that they should pay their respective portions over to one or two banks, and that the secretary should draw it out by issuing checks like an ordinary borrower. Congress had voted to suspend the law forbidding the Government from receiving anything but specie. The banks said that this would be the easiest way for them, as the checks would then simply go through the clearing house like other checks. Mr. Chase, however, insisted that the banks pay the Government in gold. They undertook to do so, but sought a promise that the treasury notes, which had been authorized to the extent of \$50,000,000, should not be issued. Tho not making any formal promise, Mr. Chase assured the banks that their wishes should be regarded. Soon, however, the notes began to appear in circulation. The effect was soon apparent. The banks could provide for the redemption of their own circulation, but as the Government had only so much gold as the banks could furnish, the banks must provide for the redemption of the Government notes or they must circulate without any foundation. The banks, therefore, feared the notes.

They, however, appeared in small quantities at first, and as the gold paid out quickly came back again in the way of ordinary deposits, all went well. But as soon as the quantity of the treasury issues became considerable, the gold did not return to the banks as before, and see-

ing that it was rapidly disappearing, the banks, on December 28, 1861, concluded to suspend specie payments on the Monday following (December 30).

The balance of the \$150,000,000 they agreed to pay the Government was paid in paper. Professor Sumner says that the banks suspended unnecessarily. Nevertheless they had done so, and the Government was compelled thereby also to suspend specie payment. But more money was needed. Public sentiment favored the issue of treasury notes. Mr. Chase, in his report (see BANKS AND BANKING), had already proposed the creation of a national banking system, but it was seen that this could not be developed in time. Money was needed then. Mr. E. G. Spaulding, of New York, therefore, two days after the suspension of the banks, introduced a bill into the House authorizing the issue of \$50,000,000 of treasury notes to be legal tender in payment of all debts in the United States and receivable by

Greenbacks. Government for all dues to the United States. It was referred to the Committee of Ways and Means, consisting of Thaddeus Stevens, Chairman; J. S. Morrill, of Vermont; J. S. Phelps, of Missouri; E. G. Spaulding, of New York; V. B. Horton, of Ohio; Erastus Corning, of New York; S. Hooper, of Massachusetts; Horace Maynard, of Tennessee; and J. L. N. Stratton, of New Jersey. The committee duly considered it, increased the amount to \$100,000,000, and reported it favorably by a vote of five to four, altho Mr. Stratton finally consented to cast a favorable vote only to bring it before the House. Stevens, Spaulding, Hooper, and Maynard voted for it. It immediately created great discussion and interest. Delegates from the banks came to Washington and protested. James Gallatin, President of the Gallatin Bank of New York, made the principal speech, and proposed a counter plan of taxation, and to make a loan with the banks as depositories, the Government to issue \$100,000,000 treasury notes for two years, to be receivable for public dues except duties on imports. The consultation immediately resulted in nothing except that later the delegates favored Mr. Chase's proposals of a national banking system. Meanwhile the \$100,000,000 Legal Tender Note Bill came before the House for debate January 28. It was claimed—and on this point Stevens had at first hesitated—that the bill was unconstitutional, since the Constitution provides that "no State shall . . . make anything but gold and silver coin a tender in payment of debts." It was answered that this pertained only to States. The preceding clause in the same section, "No State shall emit bills of credit," has always been so understood. Mr. Pendleton, of Ohio, made the best plea against its constitutionality. It was believed by many that Mr. Chase doubted its constitutionality, and he was appealed to; but he wrote that necessity seemed to demand it. Mr. Morrill proposed a counter scheme. Mr. Stevens closed the debate, arguing that it was "a measure of necessity, not of choice." An amendment was passed increasing the amount to \$150,000,000; but the \$50,000,000 authorized by the July act of the previous year were to be

retired. The act finally passed by a vote of 93 to 59.

On February 10 the bill was reported by the Finance Committee of the Senate, with various amendments—among others, that the notes should not be receivable for "interest on bonds and notes, which shall be paid in coin," and an amendment relating to the issuing of certificates, which, said Mr. Fessenden, the Chairman of the Committee, "was very much desired by the banks in all the cities." This was opposed by Senator Sherman, and answered by Mr. Fessenden, who, however, opposed the bill as "a confession of bankruptcy," "bad faith," and "a stain on the national honor," altho he admitted that if it were necessary to issue legal-tender notes to sustain the Government, he should have no hesitation in doing so. The bill passed the Senate by a vote of 30 to 7. Returning to the House, after a strong contention with the Senate, its principal amendments were finally concurred in. As a fair specimen of the supporters of the bill, few of whom would have voted for it had the notes not been made legal tender, we quote Mr. Wilson, of Massachusetts, who said, February 13, 1862:

"If the legal-tender clause is not retained in this bill, I shall vote against it under any and all circumstances. . . . I shall vote for every measure to sustain these notes by sustaining the credit and good faith of the nation. . . . Your manufacturers, your merchants, your men who have their hundreds of millions trusted out in all parts of the country, are for this measure, for it is their protection and their interest. You will find that the families of your soldiers who are to receive a small pittance from the men who are fighting the battles of your country in the field are in favor of stamping upon these notes the words 'legal tender,' so that when that little pittance comes from the field to them to support them at home, they can use it to pay their necessary debts and support themselves without having to go through the process of broker-shavings. . . . I believe the sentiment of the nation approaches unanimity in favor of this legal-tender clause. . . . The intelligence I obtain from all portions of the country is to the same effect. . . .

**Legal
Tender.**

Senator Sherman said the same day:

"I do believe there is a pressing necessity that these demand notes be made a legal tender, if we want to avoid the evils of a depreciated, dishonored paper currency. I do believe we have the constitutional power to pass such a provision, and that the public safety now demands its exercise. . . . We have the concurrence of the Chamber of Commerce of the city of New York, the opinion of the Committee on Public Safety of the city of New York, composed of distinguished men, nearly all of whom are good financiers, who agree fully in the same opinion. I may say the same in regard to the Chambers of Commerce of the city of Boston, of the city of Philadelphia, and of almost every recognized organ of financial opinion in this country. They have said to us in the most solemn form that this measure was indispensably necessary to maintain the credit of the Government. . . . I desire to show the necessity of it from reason.

"We have to raise and pay out of the treasury of the United States before July 1 next, according to the estimate of the Committee of Ways and Means, the sum of \$343,235,000. Of this sum, \$100,000,000 is now due and payable to your soldiers, to contractors, to the men who have furnished provisions and clothing for your army, to your officers, your judges, and your civil magistrates.

"Where will you get this money?
"A question of hard necessity presses you. We know very well that this money cannot be obtained of the banks."

The bill finally passed as amended by a vote of 97 to 22, and was signed by the President. February 5.

On February 19, 1862, the Hon. Mr. Spaulding spoke to the amendments of the Senate to the legal tender bill :

"Mr. Chairman, I desire especially to oppose the amendments of the Senate which require the interest on bonds and notes to be paid in coin semi-annually, and which authorizes the Secretary of the Treasury to sell 6 per cent. bonds at the market price for coin to pay the interest. . . . It might be very pleasant for the holders of the 7³/₁₀ Treasury notes and 6 per cent. bonds to receive their interest in coin semi-annually, but very disastrous to the Government to be compelled to sell its bonds at ruinous rates of discount every six months to pay them gold and silver, while it would pay only treasury notes to the soldier, sailor, and all other creditors of the Government. I am opposed to all those amendments of the Senate which make unjust discriminations between the creditors of the Government. A soldier or sailor who performs service in the army or navy is a creditor of the Government. The man who sells food, clothing, and the material of war for the use of the army and navy is a creditor of the Government. . . . All are creditors of the Government on an equal footing, and all are equally entitled to their pay in gold and silver. I am opposed to all those amendments of the Senate which discriminate in favor of the holders of bonds. . . . Why make this discrimination? Who asks to have one class of creditors placed on a better footing than another class? Do the people of New England, the Middle States, or the people of the West and Northwest, or anywhere else in the rural districts, ask to have any such discrimination made in their favor? . . .

"No, sir; no such unjust preference is asked for by this class of men. They ask for the legal-tender note bill pure and simple. They ask for a national currency which shall be of equal value in all parts of the country. . . . They want a currency secured by adequate taxation upon the whole property of the country which will pay the soldier, the farmer, the mechanic, and the banker alike for all debts due. . . .

"Who, then, are they that ask to have a preference given to them over other creditors of the Government? Sir, it is . . . a class of men who are very sharp in all money transactions. They are not generally among the producing classes, not among those who by their labor and skill make the wealth of the country, but a class of men that have accumulated wealth—men who are willing to lend money to the Government if you will make the security beyond all question, give them a high rate of interest and make it payable in coin. . . . Safe, no hazard, secure, and the interest payable in coin. Who would not be willing to loan money on such terms?"

On February 20, Thaddeus Stevens, closing the debate upon this bill, said :

"I approach the subject with more depression of spirits than I ever before approached any question. No personal feeling influences me. I hope not, at least. I have a melancholy foreboding that we are about to consummate a cunningly devised scheme which will carry great injury and great loss to all classes of the people throughout this Union, except one.

"With my colleague I believe that no act of legislation of this Government was ever hailed with as much delight throughout the whole length and breadth of this Union by every class of people, without any exception, as the bill we passed and sent to the Senate. . . . It is true there was a doleful sound came up from the caverns of bullion brokers and from the saloons of the associated banks. . . . They fell upon the bill in hot haste, and so disfigured and deformed it that its very father would not know it. . . . It is now positively mischievous. . . . It makes two classes of money—one for the banks and brokers and another for the people."

In speaking of the mutilated bill, he said later :

"We did not yield until we found that the country must be lost or the banks be gratified, and we have sought to save the country in spite of the cupidity of the wealthy citizens."

To the legal-tender act Judge Kelley, on January 15, 1876, in Philadelphia, refers in these words :

"But the patriots to whom I have referred had studied the Constitution of the United States. They knew that it had imposed upon them the duty of saving the nation. They knew that money is the sinew of war. . . . A marvelous child was that 'rag baby.' It lighted the fires in every forge and furnace in the country; it hired ships and bought others. . . . It rallied an army of 75,000 men, and we soon after heard ringing through the streets shouts of well-paid and well-clad soldiers—'We're coming, Father Abraham, 300,000 more.' It met all demands, and the free States, with the great war on its hands, were prosperous as they had never been before."

Of the Senate's limitations he said :

"That crime perpetrated by the Senate of the United States, or that blunder worse than a crime, has cost the American people more than all the war would have cost had the House bill been adopted as originally passed."

Even Senator Sherman said, in 1862 :

"If we can compel one citizen to take this paper money, why not another and another? Is it any less the violation of contracts in one case than another? Do not all citizens hold their property subject to unlimited power of taxation? Do not all share in the blessings of Government, and should not all share in its burdens? Shall we inflict a loss only on those who trust the labor for the Government, and relieve the selfish, avaricious, idle, unpatriotic citizen who will neither fight for, lend to, nor aid the Government?"

"Sir, to make all these share in the burden of the war, and to relieve those who risk life and property in its defense, I would waive a constitutional doubt."

Such, even in the opinion of men not Greenbackers, was the effect of this limitation.

On the other hand, by many believers in specie it is claimed that it has not even yet been proved that any such notes were needed, and that the United States could not have gotten along without issuing these notes. However, the bill passed, and was soon followed by another of \$150,000,000 more.

Many who voted for the first bill strongly opposed the second; but it passed and became a law. The banks, tho prudently confining their issues for a time after suspending specie payments, turned a fresh issue into the swollen stream. Hav- **Second Issue.** ing suspended specie payment they could issue as much as they chose.

As soon as the legal-tender notes appeared, the banks could legally use these for redeeming their own issues, and thus the way had been made easy for an enormous inflation. Some of the banks did, in truth, collect the legal-tender notes and substitute their own to a much larger amount. The increase in one year, after suspension of specie payment, was \$56,000,000 (Treasurer's Report, 1866, p. 67). This was one of the causes of enmity on the part of Congress against the banks, and helped onward the creation of a rival system and the imposition of the tax of 10 per cent. on the State bank issues, which finally drove them out of existence.

At this time this was one of the strongest arguments made for issuing more treasury notes. Mr. Hooper, of Massachusetts, said in the debate :

"I confess that I can see no limit to a depreciation of the currency that may be produced by the banks; and were it not that I have great faith in the prudence and wisdom and patriotism of those who manage the banks, I should have great apprehension in regard to it, as no obligation is now recognized by them to redeem their circulation, many of the States having legalized the suspension of specie payments."

Another member said of the banks :

"They have authority to buy up our bonds in the market, to take up our circulation, and put their circulation in place of it, and that is what they are doing all the time, and the question is whether we shall pay these people 6 per cent. upon our bonds for furnishing no better currency than we can furnish ourselves. . . . In other words, it is a struggle on the part of the banking institutions of the country to bleed the Government of the United States to the tune of 6 per cent. on every dollar, which is necessary for the Government to use in carrying on this struggle for our independence and our life." Senator Sherman said the same in milder form: "The legal-tender notes are actually kept out of circulation by the depreciated bank paper of the country; and every issue you make increases that tendency. Every new issue of treasury notes is only a bid for new inflation by the banks, and thus the better money of the United States is hoarded and laid away, and the paper money which is issued on the credit of it is thrown on the country, producing inflation and derangement of our monetary system, and I believe in the end will produce disaster." (A. S. Bolles's *Financial History of the United States*, vol. iii., pp. 79, 80.)

Senator Chandler, of Michigan, spoke strongly against the issue, but it passed. Depreciation set in and gold rose. By August, Professor Sumner says that specie had disappeared. July 11 postage-stamps were made legal payment to the Government in quantities not exceeding \$10. Corporations and individuals began to issue "shin-plasters," and in many cases made them exchangeable for commodities. Cities and towns issued small notes payable in taxes or lawful money. This was forbidden by Congress for amounts less than \$1. In March, 1863, Congress authorized the secretary to issue fractional currency to an amount not exceeding \$50,000,000. But already by February, 1863, Congress had issued \$400,000,000 of treasury notes (the last \$100,000,000 of these being in January, 1863, to pay the soldiers), and had indorsed \$60,000,000 more of other notes with the legal-tender quality, besides the postage-stamps, etc.

The next step we give in the words of Mr. A. S. Bolles (*Encyclopedia Americana*, article FINANCE) :

"The same law which authorized the first issue of legal-tender notes also authorized the issue of \$500,000,000 of bonds bearing 6 per cent. interest and payable after five and within 20 years. The interest was payable in gold collected from import duties, and at this early date Congress also provided that one per cent. of the public debt should be discharged annually. At first the bonds sold very slowly, but, in the mean time, the Government procured considerable funds by two kinds of temporary loans. The first consisted of certificates of indebtedness, which were nothing more than certificates given to such creditors of the Government as would take them, payable in a year, or sooner if it desired, and bearing 6 per cent. interest. The other kind of temporary loan consisted at first of \$25,000,000, and finally increased to \$100,000,000, of deposits of treasury notes by the banks to the Government, which bore not exceeding 5 per cent. interest, and which they could demand after 30 days' notice."

To some members of Congress this operation of the treasury seemed to be wholly for the benefit of banks, as the Government could make no use of money which it was liable to pay at such a short notice. In truth, however, the Government did use all of the money thus loaned, so that it was a highly favorable operation of the Government. To provide more adequately for the payment of these deposits, if they should be demanded when the Government was not able to respond, an issue of \$50,000,000 legal-tender notes was authorized for this purpose. When the country became full of

these notes the bonds began to sell. Arrangements were made with Jay Cooke & Co., and large quantities were sold by them. Mr. Chase then withdrew their sale and tried bonds at only 5 per cent. No one wanted these, and the debt rapidly increased.

Meanwhile the bill establishing the national banking system had been at last enacted. (See BANKS and BANKING.) It was Mr. Chase's favorite measure. He had outlined it in his first report and emphasized it in his second, and President Lincoln strongly favored it. A sentiment against the State banks had developed partly through their expansion of notes to replace or at least add to the treasury notes, and so cause inflation. Many believed that there was a general policy of the banks to cause inflation, and so drive specie into their hands, to be used later when the crash should come. Even a bank officer in Pennsylvania wrote in December, 1862: "The present expansion of the banks is unjustifiable. . . . They will continue to expand until the bubble bursts or the iron hand of the Government interferes to save the people. This *ad libitum* issue of paper is filling up all the channels of circulation and forcing specie into the clutches of hoarders and the hands of brokers" (Bolles's *Financial History*, vol. iii., p. 135). Many believed that but for the bank issue the Government notes would not have depreciated. Mr. Chase himself, in his report for 1863, said of these bank issues: "Were these notes withdrawn from use it is believed that much of the now very considerable difference between coin and the United States notes would disappear." Amasa Walker, of Massachusetts, in a speech prepared but not delivered, wrote: "Could I have my own wishes, I should, as I have before insisted, instead of creating a rival system, lay a tax of 3 per cent. semi-annually on all present bank circulation, drive it entirely out of existence, and fill its place with the legal-tender notes of the Government, so that on the return of peace and specie payments by the Government and banks, there would be no credit currency issues except those made by the national currency, which, by suitable limitation, might always be kept at par with gold" (*Bankers' Magazine*, 17, p. 833). Senator Sherman had said in the Senate, July 4, 1862: "When you issue your pay money now, as you are compelled to issue it, it becomes the basis of other issues by the banks, and the inflation which you are compelled to give becomes a double inflation from its consequence on the banks of the United States. When the Government of the United States issued \$150,000,000 of notes, if there had been no depreciated bank paper money in the United States, that of \$150,000,000 would this moment have been at par with gold."

With this hostility to the State from very different sources it was not strange that a national banking system should be favored. Mr. Chase was obstinate in his purpose of effecting it. A bill for its creation was introduced into the Senate by Mr. Sherman, and supported at length by him. Mr. Collamer opposed the bill in an elaborate speech, saying that it would destroy the State banks and create a monopoly that

**National
Banking
System.**

would give the Secretary of the Treasury too much power. The bill passed by a vote of 23 to 21. In the House similar bills had been debated before, but not enacted, and the debate was now brief. Mr. Spaulding and Mr. Fenton, both of New York, supported it. Mr. Baker, of the same State, principally opposed it. It passed by a vote of 78 to 64 on February 20, 1863, and received the President's signature February 25. The bill (see BANKS AND BANKING) provided for an issue of \$300,000,000. Yet no issues appeared till December 21, and conversions of the State banks did not take effect until after the amendments of the bill the next year, the act of March 3, 1865, which forced their conversion by a tax of 10 per cent. on all issues of State banks, and the decision that the act was constitutional. Then the process went on rapidly. But we are anticipating. Many claimed that the delay was because the banks wanted to send the treasury notes to a lower point before they bought them all and exchanged them for bonds, which meanwhile Mr. Chase was gradually placing. Into all the details of the placing of these bonds we need not enter. When Mr. Chase found that he could not place the bonds at 5 per cent. he had recourse to the issue of more legal-tender notes which he induced

Inflation. Congress to authorize till the currency was depreciated to a point where he could place these bonds.

Thus, wittingly or unwittingly, he played into the hands of the bond-buyers, who bought these bonds with a depreciated currency, and then held them for the contraction which later they forced. On the last day of the fiscal year 1864 Mr. Chase retired from the office of the treasury and Mr. William P. Fessenden, of Maine, took his place. Mr. Chase, not a banker by profession and without much experience in financiering, had yet proved himself obstinate and unwilling to learn. Whatever were his intentions—and it must be allowed that they were probably good and his difficulties great—he had, yet without consenting to what the bankers desired on many points, actually played into their hands. Men said that his ambition to be president had been his weakness. Mr. Fessenden was a man of different type. He determined, if possible, to issue no more treasury notes. He advertised for a loan, the lenders to receive treasury notes payable in three years, with semi-annual interest at 7.3 per cent. in lawful money. The response was not great—the soldiers themselves, however, taking over \$20,000,000. Once more then he endeavored to sell bonds, and was successful. Bids reached nearly \$70,000,000, and the premium offered was 4 per cent. and higher. He continued this general policy till, being reelected to the Senate, he retired from the treasury on March 5, 1864, and Hugh McCulloch took his place. In April, Richmond was captured, and soon after the Confederate armies surrendered. Mr. McCulloch knew that he would now need a large sum for transportation, pay, and bounties. To use his own words, "As it was important that these requisitions should be promptly met, and especially important that not a soldier should remain in the service a single day for want of means to

pay him," the secretary perceived the necessity of realizing as rapidly as possible the amount—\$53,000,000—still authorized to be borrowed under the act of March 5, 1865. The 7.3 per cent. notes had proved to be a popular loan, and altho a security on longer time and lower interest would have been advantageous to the Government, the secretary considered it advisable, under the circumstances, to continue to offer these notes to the public, and to avail himself, as his immediate predecessors had done, of the services of Jay Cooke in the sale of them. The result was in the highest degree satisfactory. . . . No loan ever offered in the United States, notwithstanding the large amount of Government securities previously taken by the people, was so promptly subscribed for as this. Before August 1 the entire amount had been taken." This was the last war loan. The other great war loans had been :

\$500,000,000, authorized February 25, 1862 ; \$900,000,000, March 3, 1863 ; \$200,000,000, March 3, 1864 ; \$400,000,000, June 30, 1864 ; \$600,000,000, March 3, 1865.

The acts for legal-tender notes may be thus summarized :

\$150,000,000, February 25, 1862 ; \$150,000,000, July 11, 1862 ; \$150,000,000, January 17 and March 17, 1863 ; \$400,000,000, March 3, 1863 ; six per cent. interest-bearing notes, running not longer than two years ; \$400,000,000, June 30, 1864, and January 28, 1865, 7.3 per cent. interest-bearing notes, running for three years or longer.

The cost of the war was estimated at \$6,844,571,431.03 (Sen. Doc., No. 206, 46 Cong. Second Session). The expenditure by States and Municipalities was \$467,954,364 (Bolles's *Financial History*, vol. iii., p. 245).

It will be seen that the issue of non-interest-bearing legal-tender notes was comparatively not large. Their effect has been probably exaggerated. Prices rose not only because of inflation, but because of the enormous demand for arms and other commodities by the Government. The price of gold was comparatively but slightly affected by the issue. It went up and down according as war reports were unfavorable or otherwise. Gold speculation was also rife. **Speculation.** Hugh McCulloch, Comptroller of the Currency, said, in his second report : "Hostility to the Government has been as decidedly manifested in the effort that has been made in the commercial metropolis of the nation to depreciate the currency as it has been by the enemy in the field, and unfortunately the effort of sympathizers with the rebellion and of the agents of the rebellious States to prostrate the national credit has been strengthened and sustained by thousands in the loyal States whose political fidelity it might be ungenerous to question. Immense interests have been at work all over and concentrated in New York to raise the price of coin, and splendid fortunes have been apparently made by their success. . . . Gold has been a favorite article to gamble in. . . . The effect of all this has been, not to break down the credit of the Government, but to increase enormously the cost of the war and the expense of living ; for, however small may have been the connection between the price of coin and our domestic products, every rise of gold, no matter by what means effected, has been used as a pretext by holders and speculators for an advance of prices, to the great injury of the Government and the sorrow of a large portion

of the people." He again, in the same report, gives a statement of the price of gold in the New York market from January, 1862, to September, 1864, and then adds: "None of these fluctuations (from a premium of 23½ to 185) were brought about by an increase or decrease of the currency; on the contrary, gold rose the most rapidly when there was no considerable increase of the currency, and fell in the face of large additions to it. Nothing can be more conclusive of the incorrectness of the opinion that gold is always the standard of value, and that the high price during the progress of the war is the result of an inflated currency, than this brief statement of its variations in the New York stock market." A senator (*Globe*, April 15, 1864, p. 1645) stated a partial cause of gold fluctuations: "It is the immense business that your citizens are now carrying on, domestic as well as foreign; it is the immense amount of bonds which your local corporations throughout the whole extent of the United States are issuing for the purpose of accomplishing some particular local or general improvement. The whole, in one sense, is a species of currency, by means of which the business of the country is being conducted." Whatever were the causes, however, prices did rise. Money was so plentiful that the demand for products of the Old World, especially those of luxury, was unparalleled. Fortunes were made by speculation, and the basis laid for the change of our social life from one of comparative simplicity to comparative luxury. One thing only did not rise in proportion. Wages were the slowest of any "commodity" to advance. They suffered the most from the speculation. Mr. McCulloch said, in a speech at Fort Wayne, 1865: "Men are apparently getting rich, while morality languishes and the productive industry of the country is being diminished. Good morals in business, and sober, persevering industry, if not at a discount, are considered too old-fogyish for the present times." To many the creation of this tendency was the worst legacy left the country by the speculators during the war.

4. SINCE THE WAR.

As soon as the war was over there was general talk of a return to specie payment. Mr. McCulloch, then Secretary of the Treasury, strongly recommended this, and prepared for it. The President, in his annual message, sustained the Secretary, and boards of trade and similar organizations all over the land endorsed the position. "Five years ago," said Mr. Lincoln, "the bank-note circulation of the country amounted to \$200,000,000; now the circulation, bank and national, exceeds \$700,000,000. The simple statement of

Restriction. The fact recommends more strongly than any words of mine could do the necessity of our restraining this expansion. The gradual reduction of the currency is the only measure that can save the business of the country from disastrous calamities; and this can be almost imperceptibly accomplished by gradually funding the national circulation in securities that may be made redeemable at the pleasure of the Government."

Many, however, objected to a reduction of the currency. They argued that it would reduce prices and injure trade, raise the value of the bonds already taken, and the debt of the debtor classes. (See CONTRACTION AND EXPANSION OF CURRENCY.) The Secretary met these criticisms as best he could, arguing mainly that it was better to get to specie payments as rapidly as possible and prevent getting more debts, even if it did hurt the debtor class to some extent. "The process," he said, "need not be injuriously rapid." There was a long and warm debate in Congress, Messrs. Morrill, Hooper, and Wentworth strongly favoring contraction, Messrs. Kelly and Boutwell, with Mr. Sherman, in the Senate, strongly opposing. There were many amendments, and the Secretary was finally authorized to retire \$4,000,000 of notes a month. The bill passed the House by 83 to 53, 47 members not voting. In the Senate only seven voted against it (act of April 12, 1866). By 1868 there was such stringency in the money market that a bill to suspend the retiring of the legal-tender notes was hurriedly passed. In 1870 the banks were authorized to increase their circulation to the amount of \$54,000,000, but a similar amount of the loan certificates were to be destroyed. With the opening of General Grant's administration (1869) Mr. McCulloch had been superseded by G. S. Boutwell, and in October of that year he issued \$1,500,000 legal-tender notes to relieve a Wall Street stringency, and the next year a larger amount; but he was so criticised that he and Mr. W. A. Richardson, who succeeded him March 17, 1873, retired the issue. This was the year of the great crisis, and Mr. Richardson had hardly become Secretary when the cyclone struck the country, and Mr. Richardson was induced to issue more notes. He, however, asked Congress to decide whether the Secretary should be allowed to do this whenever a crisis came, and the House voted that notes could be issued up to \$400,000,000. This was the effect of the growing protest against Mr. McCulloch's policy of contraction. The debtor class were beginning to cry out, and the crisis of 1873 brought this to a head. The bill was then carried to the Senate and debated. Meanwhile, general interest and excitement were aroused. A bill to establish free banking had been introduced into the House. The whole country seemed full of plans to prevent another crisis. Over sixty different bills were sent to the Senate finance committee proposing every conceivable step—from establishing an elastic currency, as proposed by General Butler, to the resumption of specie payments, proposed by Messrs. Cox and Pierce. The Senate finally voted to increase the legal-tender notes to \$400,000,000, and to authorize an additional issue of \$46,000,000 of bank-notes, to be distributed in the South and West. This bill the President vetoed, the specie and bank men believing this to be "one of the crowning glories in President Grant's civil career" (Bolles's *Financial History*, vol. iii., p. 289); the inflationists, as friends of the bill were called, believing that it showed that the President was under the influence of the bankers and bondholders. Early the next session a bill was introduced by Mr. Sherman in the Senate entitled "An act to provide for

the resumption of specie payments." Upon it all the Republican senators were agreed except Mr. Schurz.

The main features were the withdrawal of \$80 of the legal-tender notes for each issue of \$100 of national bank-notes, until the aggregate amount should be reduced to \$300,000,000, and the accumulation of coin from customs duties and the sale of bonds. The question arose, Could the treasury notes thus withdrawn be reissued? When Mr. Sherman was asked, he replied that the question must be left unsettled. It was seen that if they could be, the intent of the law could be defeated. It was a defective, double-faced law. Opposition in Congress to any kind of a resumption measure was strong.

But the bill passed. As a matter of fact, the secretaries, Bristow and then Morrill, gradually retired the legal-tender notes, till in March, 1877, Senator Sherman himself became treasurer. He completed the work. He sold as the bill allowed, but, as the former treasurers had not done, bonds enough for coin to resume specie payments. An arrangement was entered into with the banks, and on January 1, 1878, specie payments were wholly resumed, to the delight of the friends of specie and amid the indignation of a growing greenback party. We have followed this portion of our subject to its conclusion; but simultaneously with this question of resumption other great currency questions were being discussed, and were connected with it. From the beginning one of the great objections raised to the issue of legal-tender notes had been their alleged unconstitutionality, Mr. Pendleton, of Ohio, making perhaps the strongest speech on that side. The State courts decided in favor of the law, with the single exception of the Supreme Court of Pennsylvania. The Court of Appeals of New York at an early day declared the law to be constitutional. But all felt that the question would not be settled until it reached the United States Supreme Court. When it finally came before that tribunal in 1867, Mr. Chase was the chief justice. He and four of his colleagues (Nelson, Grier, Clifford, and Field) decided against the constitutionality of the law, the other three dissenting. It was said that Mr. Chase now decided against the constitutionality of what he himself had once favored, because he thought it would aid his presidential chances. At the time of rendering this decision, however, two vacancies existed, which were soon after filled. The attorney-general, R. E. Hoar, then applied for a reargument of the question in another case. He claimed that the former decision had been made when the bench was not full, and that a question of such transcendent importance ought not to be declared as definitely settled until all the members had expressed an opinion. The judges who concurred in the opinion given were opposed to opening the question; but those who dissented, uniting with the two new appointees, constituted a majority, and decided in favor of another argument. The decision in the second case sustained the law. At a later period another question was raised—namely, that, admitting it was constitutional to issue

such notes in time of war, could this be legally done in a time of peace? The court in the second case maintained that if the issuing of such notes was necessary to supply the absolute necessities of the treasury, that if nothing else would have enabled the Government to maintain its armies and navy, nothing else would have saved the Government and the Constitution from destruction, while the legal-tender acts would, could any one be so bold as to assert that Congress had transgressed its powers? Whether they were needful, the court declared, was a question for Congress to decide. If it was a question for Congress in the second case, it was equally so in the last case, so the court decided, and thus the law stands. This case was not decided till March, 1883.

Another great question of this period was concerning the paying off of the public debt. In September, 1865, it stood at its maximum, \$2,757,689,571. Public sentiment favored its being paid as rapidly as possible. It was needful to make provision for the debts as they matured, and Secretary McCulloch's policy was to take up from time to time such portions of it as could be advantageously converted into bonds, bonds or paid in currency before maturity, so as to avoid the necessity of accumulating large sums of money or of being compelled to sell bonds at the last moment, when perhaps the condition of the market would prevent their sale on advantageous terms. He asked and received from Congress large discretionary powers as to the sale. He then drew in as rapidly as he thought possible the temporary loans, certificates of indebtedness, the compound interest notes, by converting them into bonds at 6 per cent. He also kept a large gold reserve. Most people believed that Mr. McCulloch acted wisely and well. Not all, however. His withdrawing of the temporary loans, etc., practically acted as a reduction of the currency, since they were to no little extent used as currency, and some of them had been endowed with the legal-tender quality. Men began to feel the pressure. By 1868 the last of the temporary obligations had been funded, and \$271,496,018 of the public debt had been paid. This was well; but men began to question. Bond-seekers were buying the bonds for legal-tender treasury notes at their face value, which they had got perhaps at a depreciation even down to two or three for one dollar, and were now drawing interest in gold, and would get the principal in gold. For some of this payment in gold there was no help, as the bondholders had seen to it that while the soldiers and others could be paid in paper, the law read that their interest should be paid in gold. But of all the bonds this was not true. Of some of them the law did not say in what their interest or principal should be paid. This was true of the \$500,000,000 five-twenty loan of 1863. The question now arose called "the Ohio idea," whether it was not justifiable to pay this off in legal-tender notes. The secretary was pronounced in his utterances that they should be paid in gold, and that honesty demanded this. It was argued that as this was expressly stated of other bonds, this was the implicit understand-

ing in regard to all the bonds. On the other hand, it was held that the mere fact that it was not stated so of some and was stated of others showed there was a difference. Debate ran high through all the country, and, with other causes, led to the formation of the Greenback Party, tho many State conventions of all, and especially of the Democratic Party, favored paying these bonds in paper. Mr. Tilden, however, and the leaders of the Democratic Party in the East, mainly favored gold payment. Failing to get Congress to pay in paper, some extremists favored repudiation. Credit was said to be damaged. Congress therefore, in March, 1869, passed the so-called Credit Strengthening Act, pledging the faith of the United States to pay all principal and interest in gold save where the law authorizing an issue had expressly provided that it could be paid in other currency than gold or silver. This was received with joy and boasting by those who believed in specie, which they called "honest money," and was denounced as the influence of the bondholder upon legislation by the growing number of believers in "soft money," and by not a few who did not so believe, but yet feared the bondholder's power.

It is in these votes, one by one enacted in favor of the so-called "money power," that one must look for the basis of the Greenback charge of a "gold conspiracy," which has played so important a part in the Greenback and People's party movements.

Many soldiers pronounced the enactment unscrupulous. They had faced opposing ranks—had saved the nation and kept its banner from trailing in the dust. They protested against these privileges being granted to a few bondholders by this Government when it could not keep its faith with them. They demanded restitution, and asked their representative in Congress, General James B. Weaver, to introduce a bill in that body asking that the difference between paper and coin payment be made to them as per agreement, but Congress would not hear.

In 1870 a bill was introduced into the Senate by Mr. Sumner, among other things, exempting all national bonds from taxation, State or national, it being urged that to tax them would be simply to lower their value, so that the Government would sell them for less, and thus lose whatever she should gain from them by taxation. After much debate, this was enacted. The Greenbackers, however, claimed that the bank influence was growing more and more. The Greenback claim was that a "bank conspiracy" had caused the greenbacks to be depreciated by putting limitations on their legal-tender value and by themselves inflating the currency with their own notes; that they had then caused needless bonds to be issued by the Government; that they had next, when the greenbacks had got low enough, bought these bonds with the depreciated greenbacks, the Government taking them at their par value; that they then caused Congress to vote that the capital and interest in them all should be paid in gold, and that they should not be taxed. It was, moreover, charged that the banks and

bondholders, having got the bonds with a depreciated currency, were now inducing the Government to contract the currency by withdrawing the notes under the color of returning to an "honest" specie basis, and by funding the debt to make the debt more permanent. The whole national banking system was declared to be an organization to make the debt permanent. It was declared that when Congress voted to pay all interest and principal in coin, amounting to many hundreds more of gold and silver coin than were in its resources to pay, it was proof that the Government intended the debt never to be paid off, but to be the abiding benefit of the bondholding class. Had not Mr. Chase said in 1862 of the national banking system :

"The central idea of the measure is the establishment of a sound uniform currency throughout the country upon the foundation of national credit (in other words, upon a national debt), making this the settled policy of the country."

If, now, this settled policy was based on the national debt, using it to furnish the people with a permanent circulation, did it not prove that the debt was to be permanent? Comparing the Government's treatment of the favored bondholder with its treatment of the soldier, who was paid in paper, and the poor man, whose debt was increased by contracting the currency, the Greenbackers roused bitter feeling against the gold policy.

Nevertheless, the secretaries went steadily on funding the debt, and paying it off slowly. Into all the details we need not enter. The process went on under the secretaries McCulloch, Boutwell, Richardson, Bristow, Morrell, Sherman, Windom, Folger, Gresham. The secretaries were able to get lower and lower interest, till Secretary Windom was able to get $3\frac{1}{2}$ per cent., and later, when rechartering (see BANKS AND BANKING), the national banks were allowed to exchange the "Windoms" of $3\frac{1}{2}$ per cent. to other bonds, with longer time to run, bearing only 3 per cent. On November 1, 1884, the net debt was \$1,408,482,948.69. In 19 years the debt had been reduced \$1,347,948,622.74, and the annual interest charge \$103,653,866.37.

"In the management of its debt," said Mr. McCulloch, then again Secretary of the Treasury, "the United States had been an example to the world. Nothing has so much surprised European statesmen as the fact that immediately after the termination of one of the most expensive, and in some respects exhaustive, wars that has ever been carried on, the United States should have commenced the payment of its debts and continued its reduction through all reverses until nearly one half of it has been paid. . . . It is true that all this has been effected by heavy taxes, but it is also true that these taxes have neither checked enterprise nor retarded growth."

Paying the Debt.

But there are other sides to this statement. For the argument that these heavy protective war tariffs were paid by the consumers, see FREE TRADE. We notice here another point. Greenbackers and some not Greenbackers said that by contracting the currency the Government, while paying off a part of the debt, was making the remainder of the debt really worth more, measured by what it would buy, than the

original debt. President Andrews (*An Honest Dollar*, p. 13) says: "Our national debt on September 1, 1865, was about two and three quarter billions. It could then have been paid off with eighteen million bales of cotton or twenty-five million tons of bar iron.

**Falling
of Prices.**

When it had been reduced to a billion and a quarter, thirty million bales of cotton, or thirty-two million tons of iron, would have been required to pay it. In other words, while a nominal shrinkage of about 55 per cent. had taken place in the debt, it had, as measured on either of these two world staples, actually been enlarged by some 50 per cent." When a trained economist says this, it can be fancied what has been said by men feeling as the Greenback Party felt on this question. It was of not much use for Mr. McCulloch to talk to them of how the debt had been paid off, when they held that he and his fellow-secretaries had made the debt that was left worth more than the original debt, and had, moreover, in proportional measure, increased the debt of every farmer who had a mortgage on his farm, or every poor man who owed any money. It is perfectly true that by no means all this appreciation of the value of the debt could be laid to the contraction of the currency. Undoubtedly a large part must be laid to invention, skill, and the general progress in lowering the expense of production, so that a dollar can now go twice as far in many ways as in war times, and in this progress all classes have had part. (See MONOMETALLISM.) Nevertheless, to men who held that when they borrowed a dollar it represented a certain possibility of purchase in the market, they ought in all equity to be asked only to return the same possibility of purchase, the same real value, and that, therefore, if when they came to return the dollar, it had appreciated, no matter how, enough to be worth the price it was when they borrowed it, they ought in equity only to be asked to return 50 cents. To such people, maddened by what at least looked like a favoring of the bondholding class, we can readily see what paying debts which had doubled in value came to mean, and how bitterly they denounced any approach to contraction of the currency, which would still more increase the value of their debts (for a discussion of this position, see CONTRACTION AND EXPANSION OF CURRENCY); but a realization of this thought is necessary to understand the bitterness of feeling and expression which characterized many of the Greenback leaders and to-day characterizes many of their successors, the leaders in the People's Party, robbed, as they believe, by the influence upon Congress of the bondholders.

And early in the seventies came one more element to fan their wrath—an element which has developed to-day into a question of prime importance to currency, and must therefore be well understood. After the suspension of specie payment during the war, Congress did not much concern itself with the coinage.

**Silver
Suspension.**

There were minor changes in minor coins. In 1867 a conference held in Paris, at which 19 nations were represented, proposed a single gold standard and coins of equal weight

and fineness. The Senate Finance Committee strongly favored this; but as the existing five-franc gold piece was to be the unit, it would have reduced the gold dollar in this country 3½ per cent., and Congress was not ready for this. It would have reduced the public debt \$90,000,000, and private debts proportionally. In 1870 Mr. Knox, the Deputy Comptroller of the Currency, reported to Congress, at the request of the Secretary of the Treasury, concerning the mint laws, which had not been revised since 1837. Among other things, the report proposed to discontinue the coinage of silver dollars. The reason assigned was that the silver dollar was at a premium, and had long been so, and had therefore long ceased to be a coin of circulation, being bought and melted by manufacturers of silverware. According to Bolles's *Financial History*, vol. iii., p. 378, the bill proposed by the report was reported by the Finance Committee of the Senate, discussed two days, passed, and sent to the House, where it was exhaustively discussed by Mr. Hooper and others, Mr. Kelley, chairman of the Coinage Committee, favoring, and saying that the bill had received as careful attention as he had ever known a committee to bestow on any measure, having gone over the bill not only section by section, but line upon line and word upon word. According to Upton's *Money in Politics*, p. 20, the report of the deputy comptroller distinctly stated that the bill accompanying it proposed to discontinue the issue of the silver dollar pieces; the House considered it during five sessions; the bill was printed 13 times by order of Congress and once by the commissioners revising the statutes. It passed the House by a vote of 110 to 13. Yet later, as we shall see, congressmen asserted that they had not known that the bill contained this measure, and that it had been passed surreptitiously. They asserted that the act was nominally one for the codification of the coinage laws, and new legislation was not supposed to be introduced into a codifying act unless the attention of both houses was called to the change. The act was exceedingly long, and no congressman could be held responsible for not having noticed the few lines first omitted and then inserted by which silver was demonetized. The debate which took place in the Senate was upon the minor point whether the mints should charge three tenths of one per cent. for coinage, or coin free. Mr. Kelley, of Pennsylvania, who introduced the codifying act into the House, expressly stated that the principal change proposed related to certain officials of the mint. In 1876, when the knowledge of the great change that had been made, and its consequences, had become apparent, Mr. Kelley introduced the bill to restore silver to its old place in the coinage, and permit greenbacks to be payable in the gold or silver which they promised. Not only a great many members of Congress stated that they voted for the codifying act, not knowing the great change it made, but so careful a political economist as President Walker has written that the bill had been a law for several months before he ever heard of this feature in it. The debate shows that a few members of Congress did know that the single standard was established, but most of them at least attached no

importance to it, for the country was then using neither gold nor silver, and the bullion value of a silver dollar had for many years been \$1.03 in gold, the price offered by the French mints. Only a few experts were aware of the legislation against silver which had just been entered upon by European nations, and which has resulted in making the debts of Christendom payable in gold alone. The codifying act was drafted by experts, and upon them the responsibility for its wording rests, tho it does not necessarily follow that they were guilty of a plot, since few knew how it would result.

But the results at least were momentous, and Greenbackers and believers in free silver generally believe it to have been a part of a world-

Conspiracy Charged.

wide plot to demonetize silver, contract currency, and so enhance the value of the gold loaned by the gold kings and capitalists in America, and especially in England (see **BIMETALLISM; CONTRACTION**), and "traitor" is but among the milder names they have heaped upon Senator Sherman and others, for, as they believe, selling themselves to the gold interest. For hardly had the bill been enacted when silver began to fall as compared with gold. The amount of silver in the dollar could be bought now for only 93 cents in gold; in 1874 for 96 cents; in 1876 for 97⁷/₁₀ cents; in 1877 for 90 cents. An agitation to remonetize silver was started. Mr. Reagan in 1875 introduced a bill into the House to make silver dollars legal tender to the amount of \$50. The Senate amended the bill, and authorized the coinage of a silver dollar nine-tenths fine and weighing 412⁷/₁₀ grains troy to be legal tender to the amount of \$20 in one payment, except for duties and interest on the public debt. Each House passed the amendment. The silver excitement now became universal. The statement was constantly made that silver had been demonetized by stealthy means. The silver producers wanted silver remonetized, and were joined by the growing number of those who wanted the currency expanded, and who, having failed in securing the payment of the bonded debt in paper, now wanted it paid in silver. It became a theme of general discussion in the United States. It was a prolific source of debate in the Forty-fourth Congress; and on August 15, 1876, the Senate initiated a joint resolution for the appointment of a joint commission of three senators, three members of the House, with experts, not exceeding three, to be selected by the former, whose duty was to inquire :

"First, into the change which has taken place in the relative value of gold and silver; the causes thereof, whether permanent or otherwise; the effects thereof, upon trade, commerce, finance, and the productive interests of the country, and upon the standard of value in this and foreign countries; second, into the policy of the restoration of the double standard in this country; and, if restored, what the legal relation between the two coins, silver and gold, should be; third, into the policy of continuing legal-tender notes concurrently with the metallic standards, and the effects thereof upon the labor, industries, and wealth of the country; fourth, into the best means for providing for facilitating the resumption of specie payments."

Monetary Commission of 1876.

The commission as organized consisted of Senators John P. Jones, Lewis V. Bogy, and George S. Boutwell; Randall L. Gibson, George Willard, and Richard P.

Bland, of the House of Representatives; William S. Groesbeck, of Ohio, and Professor Francis Bowen, of Massachusetts, with George M. Weston, of Maine, secretary. Circulars were issued by the commission to men of eminence in monetary studies, to authors, bankers, and business men in the United States and Europe. The chambers of commerce in the cities were invited to furnish, and did furnish, lists of persons most competent to give information. The United States representatives in foreign countries were required to aid in the work. The commission entered upon its duties with energy, collected vast stores of information, and were aided by the most eminent political economists and financial writers of all schools, who were glad to have such an opportunity for the elucidation and comparison of their views. The main substance of the report was submitted and ordered to be printed March 2, 1877. The conclusions of the commission were unanimous.

The conclusions of the majority of the committee on the first questions submitted were: That the recent production of silver relatively to gold has not been greater than formerly; that the (then) recent fall in the price of silver was not caused by any recent large production, but mainly by the concurrent demonetization of silver in Germany, the United States, and the Scandinavian States, the closure of the mints of Europe to its coinage, the temporary diminution of the Asiatic demand, the exaggeration of the actual and prospective yield of the Nevada silver-mines, and a prevailing idea that the efforts of holders of Government securities would bring about its demonetization; that gold is more fitful in production than silver; that the average production of both is more steady than of either one; "that to annihilate the monetary function of one must greatly increase the purchasing power of the other, and greatly reduce prices;" that "silver to the amount of \$3,000,000,000 in coin, the accumulation of 50 centuries, is so worked into the web and woof of the world's commerce that it cannot be discarded without entailing the most serious consequences, social, industrial, political, and commercial," that "the evil is enormously aggravated by selecting gold as the metal to be retained and silver as the metal to be rejected;" that "the exchanges of the world, and especially of this country, are continually and largely increasing, while the supplies of both the precious metals, taken together, if not diminishing are at least stationary, and the supply of gold, taken by itself, is falling off; and that to submit the vast and increasing exchanges of this country and the world to be measured by a metal never to be depended on in its supply, and now actually diminishing in its supply, would make crisis chronic, and business paralysis perpetual." Covering the second question the commission recommend the restoration of the double standard and the unrestricted coinage of both metals. The report on the third question for solution refers to the answer to the fourth—*viz.*, "the best means for providing for facilitating the resumption of specie payments." To this question the report answers, that "the remonetization of silver is a measure essential to specie payments, and may make such payments practicable." The commission believe "that the remonetization of silver in this country will have a powerful influence in preventing, and probably will prevent, the demonetization of silver in France and other European countries;" that remonetization by the United States, even without change in legislation elsewhere, will draw to us silver from other countries while it is cheap, in exchange for what we have to export; and that this country will have the benefit of the rise which the committee believe will take place in its value when the temporary causes of its depression have passed. The report concludes with these words: "If the States of the Latin Union, or other countries in Europe, abandon the double standard after we readopt it, or because we readopt it, it will be a policy on their part through which great advantages will inure to us, and great disasters will befall them. It would inaugurate in the United States an era of prosperity, based upon solid money, obtained on profitable terms, and under circumstances necessarily stimulating to our industry and commerce."

Report.

"Finally, the commission believe that the facts that Germany and the Scandinavian States have adopted the single gold standard, and that some other European nations may possibly adopt it, instead of being reasons for perseverance in the attempt to establish it in the United States, are precisely the facts which make such an attempt entirely impracticable and ruinous. If the nations on the continent of Europe had the

double standard, a gold standard would be possible here, because, in that condition, they would freely exchange gold for silver. It was that condition which enabled England to resume specie payments in gold in 1821. The attainment of such a standard becomes difficult precisely in proportion to the number and importance of the countries engaged in striving after it; and it is precisely in the same proportion that the ruinous effects of striving after it are aggravated. We propose to this country a contest for a gold standard with the European nations is to propose to it a disastrous race, in reducing the price of labor and commodities, in aggravating the burdens of debt, and in the diminution and concentration of wealth, in which all the contestants will suffer immeasurably, and the victors even more than the vanquished."

Mr. Boutwell alone made a minority report against remonetization of silver, except on a previously agreed basis, adopted in conjunction with European nations. Professor Francis Bowen expressed his dissent from the conclusions of the majority of the committee at much length; and while he argued for the gold basis alone, he finally reported in favor of the remonetization of silver, on adding to the quantity of pure silver in a dollar enough to make its bullion value equal to the then value of gold per dollar, and also recommended the reduction of the value of our gold coins, so that a \$5 piece shall be the equivalent of the English pound sterling. Meanwhile a bill had been introduced into Congress in 1876, providing for the free coinage of silver. The speeches were voluminous. The bill was amended limiting the maximum amount to \$4,000,000 a month, with a minimum of \$2,000,000, no silver to be coined on private account. Upon its passage President Hayes promptly vetoed it, but it was passed over his veto by both houses by act of February 23, 1878, the so-called Bland bill, from its author, R. P. Bland, of Missouri. The excitement and also the effort to obtain international bimetallicism induced Congress to insert the following: "Section 2. That immediately after the passage of this act, the President shall invite the governments of the countries composing the Latin Union, so called, and of such other European nations as he may deem advisable, to join the United States in a conference to adopt a common ratio between gold and silver, for the purpose of establishing, internationally, the use of bimetallic money, and securing fixity of relative value between those metals; such conference to be held at such place in Europe or the United States, at such time within six months, as may be mutually agreed upon by the executives of the governments joining in the same, whenever the governments so invited, or any three of them, shall signify their willingness to unite in the same." The section further provides that the President shall appoint three commissioners to the conference. Ex-Governor Reuben E. Fenton, of New York, William S. Groesbeck, of Ohio, and Professor Francis A. Walker were appointed. Subsequently the President was authorized to add to the list of delegates Mr. S. Dana Horton, of Ohio, an accomplished monetary student and author. Paris was chosen as the place of conference. Austria-Hungary, Belgium, France, Great Britain, Greece, Italy, the Netherlands, Russia, Sweden-Norway, and Switzerland sent their ablest representatives. The German government alone declined to participate in the conference, tho a second time invited.

The conference opened its session August 10, 1878. Leon Say, Minister of Finance in France under the presidencies of Thiers and MacMahon, was made president of the conference, and Mr. Fenton, vice-president. In his opening address to the conference, Mr. Say stated the reasons which had induced the five States composing the Latin Union, "while preserving to silver its legal-tender quality, to restrict its coinage within narrow limits, and, within the past year, to suspend it entirely." These reasons were the adoption by Germany of the single standard of gold, and the great production of the American silver mines. While Germany continued to gather and sell her silver, he thought it would be difficult to determine the value at which silver might be rated when that disturbing element in its present value was out of the way. The Latin Union, therefore, while glad to join in the American efforts to fix a ratio of value between silver and gold, "as a measure of prudence has remained in an expectant attitude." Mr. Fenton then presented the call to the conference in the words of the act of Congress. After a lengthy discussion, continuing through six sessions, marked on the whole by the position in which France found herself, of approving the double standard in theory but not able as yet to enter into any agreement in regard to it in practice

(little Switzerland alone unequivocally advocating the single gold standard both in theory and practice), the European representatives gave the American representatives the following answer:

"1. That it is necessary to maintain in the world the monetary functions of silver, as well as those of gold, but that the selection for use of one or the other of the two metals, or of both simultaneously, should be governed by the special position of each State or group of States.

"2. That the question of the restriction of the coinage of silver should equally be left to the discretion of each State or group of States, according to the particular circumstances in which they may find themselves placed; and the more so in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries.

"3. That the differences of opinion which have appeared, and the fact that even some of the States which have the double standard find it impossible to enter into a mutual engagement with regard to the free coinage of silver, exclude the discussion of the adoption of a common ratio between the two metals."

Messrs. Rusconi and Baralis of Italy at the seventh session entered a protest against the response of the majority of the European delegates as follows:

"1. That by the adoption of the formula proposed, the conference does not respond to the question which was put to it, and that in systematically avoiding to pronounce itself upon the possibility or impossibility of a fixed relation, to be established by way of international treaty, between coins of gold and silver, it leaves its task unfinished.

"2. That since the French law established such a relation (1783) between the two metals, the oscillations of their relative value had been without importance, whatever had been the production of the mines.

"3. That consequently, *a fortiori*, if the law of France had been alone able to accomplish the result, then on the day when France, England, and the United States, by international legislation, should agree to establish together the relation of value of the two metals, this relation would be established upon a basis so solid as to become unshakable."

Mr. Goschen, on the part of England, desired it to be distinctly understood that the adhesion of himself and colleagues to the response was because it *did not* pronounce for a double standard; and that he desired with equal distinction "to combat the theory of the economists who demand the universal adoption of the single gold standard—a measure which, in my view, might be the cause of the greatest disasters." Mr. De Thoroer, the Russian delegate, expressed a decided adherence to the single standard of his country—gold. Count Von Kuefstein, of Austria, said that "in presence of the explanations which had been given, from which might be inferred an admission of the impossibility of an international arrangement for the double standard, he felt himself obliged to declare that if he adhered to the formula proposed by the European delegates, it was precisely because in his view it did not exclude the idea that such an arrangement was possible."

The practical work of the conference closed with the reading of the following rejoinder, signed by the four American delegates, to the response of the European delegates:

"The representatives of the United States regret that they cannot entirely concur in all that has been submitted to them by a majority of the representatives of European States. They fully concur in a part of the first proposition, *viz.*, that 'it is necessary to maintain in the world the monetary functions of silver, as well as those of gold,' and they desire that ere long there may be adequate cooperation to obtain that result. They cannot object to the statement that 'the selection for use of one or the other of these two metals, or of both simultaneously, should be governed by the special position of each State;' but if it be necessary to maintain the monetary functions of both metals, as previously declared, they respectfully submit that special positions of States may become of but secondary importance.

"From so much of the second proposition as assigns as a special reason for at present restricting the coinage of silver, 'that the disturbance produced during the recent years in the silver market has differently affected the monetary situations of the several countries,' they respectfully dissent, believing that a policy of action would remove the disturbance that produced these inequalities."

The report of this monetary conference, prepared by Mr. S. Dana Horton, secretary of the American dele-

Report of the
Commission.

gation, forms vol. v. of the executive documents of the United States, printed by order of the Senate in the third session of the XLVth Congress, 1878-79. In addition to the journal of the proceedings of the conference, and a collection of the monetary tables and statistical tables submitted by each delegation, it contains a large variety of relevant matter of English and American legislation on money, with classic treatises and reports on monetary questions. Besides these it republishes entire the proceedings of the first monetary conference held in Paris, June, 1867; the whole forming a volume of 918 pages.

In the United States, the silver agitation went on. The act of 1873 was specially unpopular at the West, and was violently assailed as well as vigorously defended, and numerous resolutions were introduced into the Forty-fifth Congress to restore the silver dollar. November 5, 1877, Mr. Bland moved to

Act of 1878. suspend the rules of the House and pass a bill providing "that there shall be coined at the several mints of the United States silver dollars of the weight of $412\frac{1}{2}$ grains troy of standard silver, as provided in the act of January 18, 1837, on which shall be the device and superscriptions provided by said act; which coins, together with all silver dollars heretofore coined by the United States of like weight and fineness, shall be a legal tender at their nominal value for all debts and dues public and private, except where otherwise provided by contract; and any owner of silver bullion may deposit the same at any United States coinage-mint or assay office, to be coined into such dollars, for his benefit, upon the same terms and conditions as gold bullion is deposited for coinage under existing laws. All acts and parts of acts inconsistent with the provisions of this act are hereby repealed."

This was agreed to and passed by a vote of 164 to 34, and it went to the Senate. Mr. Allison moved in the Senate to amend by striking out the last clause commencing "and any owner" and inserting the following: "And the Secretary of the Treasury is authorized and directed, out of any money in the treasury not otherwise appropriated, to purchase, from time to time, silver bullion, at the market price thereof, not less than \$2,000,000 per month, nor more than \$4,000,000 per month, and cause the same to be coined monthly, as fast as so purchased, into such dollars. And any gain or seigniorage arising from this coinage shall be accounted for and paid into the treasury, as provided under existing laws relative to the subsidiary coinage; *provided*, that the amount of money at any one time invested in such silver bullion, exclusive of such resulting coin, shall not exceed \$5,000,000."

The Bland Bill with Allison's amendment passed the Senate February 15, 1878, by a vote of 49 to 22. The bill went back to the House for concurrence February 21, 1878, when it passed by a vote of 203 to 72.

President Hayes vetoed the bill February 28, and in the same day it was passed over his veto by a vote of 106 to 73 in the House and 46 to 19 in the Senate.

June 9, 1879, an act was passed raising the limit of legal tender for subsidiary silver coins to \$10, and also providing for their redemption in full legal-tender money.

In the Forty-ninth Congress a proviso was attached to the sundry civil appropriation bill authorizing the issue of one, two, and five dollar silver certificates. This provision has operated to remove in a measure the objections to silver where large sums are required in small denominations, as in pay-rolls on railroads and other like operations.

The year 1881, however, saw a renewed monetary agitation, when France and the United States jointly issued a call to a monetary conference. It met in Paris on April 19, 14 governments being represented at the opening, and delegates from Great Britain, India, and Canada being present a part of the time. The United States representatives were William M. Evarts, Allen G. Thurman, Timothy O. Howe, and S. Dana Horton. This conference, which continued its sessions with some breaks for nearly two months, indicated a still great approval of the theory of bimetalism, but still could come to no agreement or line of action, England and Germany being still unwilling to act. The United States, therefore, were still left to act alone. No change, however, was made in our currency, these years being marked by large decreases in the public debt and a discussion of what to do with the "surplus" in the treasury. On July 12, 1882, an act was passed providing for the extension of the charters of the national banks, the running out of whose charters had created considerable discussion.

The year 1883, however, was marked by financial depression and many failures, caused partly by poor crops and overspeculation, and fell particularly on the iron trade. Yet there was no panic till May, 1884, when it fell in force, altho in speculative rather than in commercial circles. In 1885 there was a general improvement, yet the Secretary of the Treasury and the President alike in their annual messages recommended the repeal of the silver bill of 1878; but Congress declined to act, and the next year likewise, altho it also declined to pass a free silver bill. In 1887, a year of prosperity, there was still more discussion of the "surplus" in the treasury, and again an effort to repeal the silver bill of 1878, but still Congress refused. In 1888 the revenue of the United States was over \$1,000,000 a day. The circulation of the national banks was, however, contracting, and Congress could still not be prevailed upon to repeal the silver law. In 1890 the failure of several London houses, and notably Baring Brothers, owing mainly to a crisis in the Argentine Republic, was to some extent followed by a stringency in the market here, and by the now famous Sherman Act of July 14, 1890, the treasury was directed to purchase 4,500,000 ounces of silver, or so much as might be offered at the market price, not to exceed \$1 for 37 $\frac{1}{2}$ grains of pure silver, and to issue in payment therefor treasury notes to be a legal tender in payment of all debts, public and private, except where otherwise expressly stipulated in the contract, and when held by a national bank to be counted as a part of its reserve. The act further declared that the Secretary of the Treasury should redeem such notes upon their presentation in gold or silver coin at his discretion, and that the established policy of the United States was to maintain the two metals on a parity with each upon the existing legal ratio, or such ratio as might be provided by law. The act was a compromise, but the effect was to put into circulation every month about \$6,000,000 in the certificates authorized, and so its issue created much discussion, it

**Panic
of 1890.**

finally passing in the House by a vote of 112 to 90, and in the Senate by 39 to 26.

We now come to the critical year of 1893. Early in the year gold began to go to Europe, caused mainly by the failures of the Baring

**Panic
of 1893.**

Brothers above referred to, and the resultant stringency in the London market, which continued to this time; still more by failures of Australian banks, and yet more by the decision of Austria-Hungary and Roumania to change to the gold standard. With all the world except the United States thus declaring for gold (see BIMETALLISM), the friends of gold in the United States began to urge that we could not continue to use silver in the face of the position of all the other great powers. They declared that all the gold would go to these other nations, and the United States become a silver nation, and silver depreciate, and give us all the results of a depreciated currency. They therefore agitated for the repeal of the Sherman bill of 1890. It is claimed, too, that in order to force a slight pinch in the market, and so induce people to feel that something was wrong, and therefore demand the repeal of the Sherman act, some of the banks began to decrease their circulation and decline credit. If this is the case, they little knew what they were bringing upon themselves. Credit was decreasing, failures beginning, silver falling, when suddenly came the news (June 26) that the Indian Government had decided to stop the free coinage of silver. Coming upon the other above-mentioned causes, it created at once a crisis. The day after the news, silver experienced a heavy drop, and silver mines in Colorado began to close. Men were discharged all over the country. Anxiety was everywhere. Silver conventions were held in Denver, July 11, and Chicago, August 8. Men and women began to draw their money from the banks, and to hoard what they could. There came a marked money famine. Banks really solvent were compelled to close because they could not get ready currency. Manufacturers with abundant credit closed because they could not get currency to pay their help. Business was prostrated, and millions lost. The newspapers industriously circulated the opinion that the panic was due to hoarding of men and withdrawal of credit, from lack of "confidence," and fear that the United States would have a depreciated silver currency, and argued, therefore, that the Sherman Bill must be repealed and the United States, with the rest of the world, declare for gold. Mr. Cleveland was induced to call an extra session of Congress and urge repeal. The account of the ensuing struggle, together with the account of the bond issues of the last two years, we abridge from the reliable record of events printed in the *Political Science Quarterly*. According to this authority, Congress met August 8. The silver men, without reference to party lines, took an attitude of energetic resistance to any project for unconditional repeal. On August 11 a bill was introduced by Mr. Wilson, of West Virginia, repealing the purchase clause, but renewing the pledge to maintain the parity of gold and silver coin at the existing or some other ratio. At the same time an order of

procedure was adopted, providing for a debate of 14 days, to be followed immediately by voting. This program was carried out, and the votes were taken August 28. All the amendments were rejected, those proposing free coinage by majorities ranging from 140 on the 17 : 1 ratio to 100 on the 20 : 1, and that reviving the Bland Act by a majority of 77. The bill was then passed by a vote of 240 to 110. In the Senate much more serious difficulty arose in seeking to carry out the policy recommended by President Cleveland. After much caucusing, with unsatisfactory results, Senator Voorhees, Chairman of the Finance Committee, at last introduced a repeal bill, August 29, with a "parity" pledge in more verbose form than that of the Wilson Bill, and with a recommendation of bimetalist policy for the Government. The silver men immediately submitted a substitute proposing free coinage of silver at the ratio of 20 : 1. Various plans were suggested for a compromise between unconditional repeal and free coinage, but the attitude of the administration was steadily hostile to any such idea. On the other hand, suggestions as to the introduction of some form of closure in the Senate met little favor. On October 11, when it had become pretty clear that there was a majority for unconditional repeal, Mr. Voorhees asked for a continuous session till a vote should be taken, but after a session of nearly 40 hours, occupied by speeches by the silver men and calls of the House, a quorum could no longer be obtained, and the Senate adjourned without voting. Attention now became concentrated exclusively upon the possibility of either compromise or closure. While propositions looking to the latter alternative were under serious and heated discussion, a scheme of compromise that proposed making the date of repeal 12 or 18 months in the future and coining in the interval all the silver purchased, was accepted by the silver Democrats, and seemed likely to secure enough support to unite the majority party, when the authoritative announcement that the President did not approve the scheme turned the current, and the project failed. Thereupon the Democratic silver senators reluctantly gave up the struggle, October 23, and the remainder of the opposition acknowledged the hopelessness of preventing a vote. The final speeches of the debate were made, the various amendments were voted down by majorities averaging about 10, and on October 30 the Voorhees Bill, having been substituted for the Wilson Bill, was passed by a vote of 43 to 32. The substitute was accepted by the House, 194 to 94, and became law by the President's approval, November 1.

**Sherman
Bill
Repealed.**

The inference, however, is by no means to be made that all the voters for repeal were friendly to gold monometallism. Many of them felt that the Sherman Bill, in itself popular with neither monometallists nor bimetalists, had been presented to the country as the cause of the panic, so that its repeal would at least tend to restore confidence, when Congress could then go on to *permanently* legislate as it saw wise. Some felt, too, that since the supply of gold in the

world is not adequate to doing the world's business, if the United States, with the rest of the world, voted to adopt a gold standard, the strain would be so great that all countries would be compelled to remonetize silver, so that this would be the quickest way to reach international bi-metallism. Thus the vote on the bill was by no means a test of the strength of monometallism. Nevertheless, its passage has been bitterly denounced by the believers in silver and an expanded currency, and the continued depression through the country they laid largely to its passage.

The marked features of 1894 and 1895 in the history of the currency have been the bond issues of the Government and their sale to private syndicates. December 20, 1893, the Secretary of the Treasury, in his report to Congress, estimated that the year ending June 30, 1894, would show a deficit of \$23,000,000. He asked author-

ity, therefore, to issue a 3 per cent. bond, redeemable in five years, and

Bond Issues. recommended that the denominations be low, so as to enlist the interest of the masses of the people.

Another suggestion for meeting the emergency was the issue of a 3 per cent. one-year bond, to be sold or paid out to Government creditors at par. Mr. Carlisle described the decrease in the gold reserve for greenback redemption, and dwelt upon the necessity of some scheme which should enable him to keep up that reserve as well as to pay the current expenses of the Government. While endorsing the principles of the tariff bill pending in the House of Representatives, he thought it would bring a revenue some \$50,000,000 less than what would be necessary, and to meet this deficit he advocated an increase of the tax on distilled spirits, and the imposition of new taxes on cigars and cigarettes, cosmetics, perfumeries, legacies and successions, and incomes from investments in corporate securities. From the beginning of the period under review the condition of the treasury, which the Secretary's report showed to be so bad, grew worse and worse. Expenditures ran steadily far ahead of receipts, and the balances on hand, both of gold and of currency, tended rapidly to extinction. On January 13 Secretary Carlisle submitted to the Finance Committee of the Senate a statement showing that the excess of expenditures over receipts to that date had reached \$43,000,000, and that at the same rate the deficit for the year would be \$78,000,000, or nearly three times what he had estimated in his report in December. The gold reserve was down to \$74,000,000, and the Secretary declared that the ordinary expenses of the Government would soon have to be paid wholly out of that fund. Unless something were promptly done by Congress to authorize the issue of low-rate bonds, he announced that he would put forth high-rate bonds under the power granted by the Resumption Act of 1875. No steps having been taken by Congress, on January 17 the Secretary announced a bond issue of \$50,000,000. The bonds were to be redeemable after 10 years, and to bear 5 per cent. interest, payable in coin. No bid would be accepted lower than 117.223, the equivalent of a 3 per cent. bond at par. The treasury's policy was immediately antago-

nized by the silver party, who wanted the financial emergency tided over by the coinage of the seigniorage. The House Judiciary Committee adopted a resolution denying the power claimed by the Secretary to use the proceeds of the bonds for paying the current expenses of the Government, and under the auspices of the Knights of Labor a suit was brought for an injunction to restrain the Secretary from issuing the bonds. Financiers found fault with the method of the issue, and claimed that there was absolutely no chance for profit under the terms imposed. On the last day of the term allowed for bids, however, the New York bankers, after several consultations with Mr. Carlisle, decided to sustain him, and subscribed for some \$45,000,000. The subscription terminated February 1, and the total amount called for was about \$58,000,000. The treasury gold balance meanwhile had run down to \$65,500,000, but the proceeds of the bonds raised it for a while above the \$100,000,000 mark. Congress had a lively struggle over the Seigniorage Bill. This measure, introduced in the House by Mr. Bland, provided for the immediate coinage of silver in the treasury to an amount equal to the difference between the cost and the coin value of the bullion purchased under the Sherman Act, which difference amounted to about \$55,000,000. The bill provided that certificates should be issued on this seigniorage as fast as coined, or faster, if the needs of the treasury required. A second section directed that, after the seigniorage was disposed of, the remaining bullion in the treasury should be coined, and the treasury notes based on it should be redeemed and replaced by silver certificates. This bill was passed in the House, March 1, by 168 to 129, the majority consisting of Democrats and Populists, with 19 Southern and Western Republicans; the minority, of Republicans, with 49 Eastern Democrats. In the Senate **Seigniorage Bill.** the friends of the bill took parliamentary advantage of a little carelessness on the part of its adversaries to cut off the long debate that was expected, and on March 15 the bill passed by 44 to 31, 10 Republicans for and nine Democrats against it. On the 20th President Cleveland vetoed the bill. His general position was that of favor to the idea of coining the seigniorage, but of hostility to this particular bill, and especially to the second section, which went beyond this simple idea. He objected to the phraseology of the bill, which was in places ambiguous, but found a wider ground for his veto in the belief that "sound finance does not commend a further infusion of silver into our currency at this time, unaccompanied by further adequate provision for the maintenance in our treasury of a safe gold reserve." The President expressed, in conclusion, a willingness to see the seigniorage coined, if at the same time provision were made for a low-rate, short-term bond to protect the gold reserve. On the question of overriding this veto, the vote in the House, April 4, stood 144 to 115, not two thirds in the affirmative.

By June 22 the gold reserve was down to \$62,000,000. The New York banks at this time came to the rescue, and supplied the export demand. In the uncertainty over the tariff, custom re-

ceipts were small and the condition of the treasury very low. With some variations, however, the gold reserve in the treasury remained at about the above amount till, November 13, subscriptions were invited for \$50,000,000, in 10 years 5 per cent. bonds, and the whole amount was awarded to a syndicate at 117.077, making the rate of interest 2.878. This raised the gold reserve to \$112,000,000, but this immediately began to dwindle. Secretary Carlisle introduced into Congress a plan for reorganizing the banking system so as to protect the treasury against demands for redemption of legal tenders and develop State-bank currency, but it was defeated, and by June 28 the gold reserve was down to \$52,463,173, the lowest point since resumption in 1879. The same day President Cleveland sent an energetic message to Congress to empower the issue of a low-rate bond. Congress declined to act, and another bond issue followed, February 7, when the gold reserve was only \$41,743,136. A contract was made with the banking houses of Belmont, Rothschild, and Morgan, for the purchase of 3,500,000 ounces of gold to be paid for in 30 years, 4 per cent. bonds, on terms which made the price about 104½, and the amount \$62,317,500. The contract provided that half the gold

should be procured abroad, and the bankers were given an option on any other bonds that could be issued up to October 1, and on their part they undertook "to exert all financial influence and [to] make all legitimate efforts to protect the treasury of the United States against the withdrawal of gold" during the same period. The 4 per cents. were soon put on the market, and the quotation rose at once to 118. The administration was violently attacked, tho it defended itself by showing that the New York sub-treasury was within 48 hours of suspension of gold payments, and that, therefore, the treasury was at the mercy of the bankers. Nevertheless the sale of bonds to the syndicate was widely denounced, some papers, like the *New York World*, demanding an investigation of the "scandal" by Congress, in part basing its surmises on the fact that Mr. J. P. Morgan was a former client of Mr. Cleveland, and Mr. Stetson, the legal adviser of Mr. Morgan and the agent of the syndicate in its negotiations, a partner of Mr. Cleveland when Mr. Cleveland practised law in New York in the interval between his first and second administrations. The *World* figured the profits of the transaction to the syndicate as follows :

Face of loan.....	\$62,315,000
Syndicate premium at 104.49.....	2,797,943
United States gets.....	\$65,112,942
Syndicate profit to 112½.....	4,835,644
What inside jobbers pay.....	\$69,948,587
Inside jobbers' profit to 118.....	3,583,113

The public pay and the United States should have received..... \$72,531,700
 United States has lost..... \$8,418,757
 Compounded as a sinking fund at 4 per cent. for 30 years, this lost profit would be..... \$27,628,676
 Or nearly one half the original loan.

PROFIT AND LOSS

Belmont & Morgan buy.....	\$62,315,000 at 104.49	\$65,112,943
Belmont & Morgan sell.....	62,315,000 at 112.25	69,948,587
Belmont & Morgan profit.....		\$4,835,644
Inside jobbers buy.....	\$62,315,000 at 112.25	\$69,948,587
Inside jobbers sell.....	62,315,000 at 118.	73,531,700
Inside jobbers' profit.....		\$3,583,113
General public buy.....	\$62,315,000 at 118...	\$73,351,700
Loss by United States to the jobbers.....		\$8,418,757

Commenting editorially upon this showing, the *World* said :

'The bonds are worth much more than 112½, and the public was not allowed to buy any of them, tho subscriptions were eagerly sent in for 10 times the issue at a much higher price than the 112½ at which the syndicate allotted the securities to its members.

"These people took the bonds as well as the profit, and they will now proceed to take another heavy profit by marking the securities up to their actual market value.

"Does anybody now suppose that Mr. Cleveland 'did the best he could' when he secretly sold these bonds to his former client's syndicate at 104½? With New Yorkers anxious for ten times the issue, and with London bankers bidding, as they did yesterday, for \$600,000,000 at 4½ points above the syndicate distributing price, can there be any doubt that the issue could have been sold in the open market for greatly more than was got for it? Was there any necessity or excuse for a secret negotiation with speculators to discredit the Government and give millions of its money away? Is there any possible reason for supposing that a public at home and abroad which to-day wants ten or twenty times the issue at three or four times the premium would have failed to take this \$62,315,000 at a much better price than that at which it was sold, if the issue had been offered openly in the market?"

Whatever were the profits, the syndicate kept its word as to protecting the treasury until October 1, when it dissolved. Soon after the reserve again began to diminish, and there was talk of another issue. Congress on its convening refused to relieve the situation. Mr. Morgan formed another syndicate, and proposed to buy the bonds on substantially the same basis as before. Some papers, and particularly the *New York World*, agitated for making it a so-called "Public Loan." popular loan, and finally succeeded in forcing this from the Government. Sealed bids were put in up to February 5, and it was found that the whole issue of \$200,000,000 was more than subscribed for at an average of about 111 instead of 104, as offered by the syndicate, saving the Government some \$7,000,000, without counting interest for 30 years. Such a result justified papers like the *World* in claiming that the previous sale to the syndicate might also have been public.

The *World* said editorially February 8, 1896 :

"The Wall Street operator who buncoed the Government out of 8 or 10 million dollars in last year's bond deal, and had his arrangements perfected to repeat the grab on a larger scale this year, and would have succeeded but for the *World*, is certainly not above criticism. Neither are the remnants of Mr. Carlisle's reputation sufficient to cover a transaction of this sort.

"There is something still to be explained in this affair. The suggestion of a Congressional investigation is timely. It might well be extended to cover the negotiations to which Mr. Morgan was invited at Washington by some member of the administration, and which led to the formation of his famous blind pool to take \$200,000,000 of bonds in exchange for gold at 'about the price' of the sale in February, 1895. The flood-light of publicity is needed for this whole transaction."

Western papers bitterly condemned all issue of bonds at any price. Said the *Chronicle* (Republican) of San Francisco :

"It matters very little to the American people whether a sale of bonds nets a few millions more or less. The thing to take into consideration is the fact that with a balance of nearly \$175,000,000 in the Treasury, the President deliberately authorizes the creation of another \$100,000,000 of indebtedness for a period of 30 years. Between the date of their emission and their final redemption these bonds will call for the payment of \$120,000,000 in interest, or \$20,000,000 more than the amount borrowed. And for what purpose are these bonds sold? To maintain a gold reserve for the redemption of United States currency—an impossible feat under existing circumstances. The futility of such attempts has already been exhibited. It has been shown that the gold, as rapidly as accumulated, will be drawn out of the Treasury so long as it is needed for export purposes."

The feeling of the People's Party and the extreme free silver men can be seen in a comparatively moderate quotation from the sensational utterance of Senator Tillman, of South Carolina, spoken on the floor of the Senate January 29, 1896. He charged that the sound-money cry was part of "a damnable scheme of robbery," having in view, first, the utter destruction of silver as a money metal ; second, the increase of the public debt by the issue of gold bonds ; and third, the surrender to corporations of the power to issue all paper money and to give them a monopoly of that function. This, he averred, included the control of the presidential nominations of both the Democratic and Republican parties in 1892 by an Eastern gold ring and the stock gamblers of Wall Street. Accusing the President of weakening on tariff reform for a

financial platform cunningly drafted to force a gold standard upon the people, he said :

"Rothschild and his American agents graciously condescend to come to the help of the United States Treasury in maintaining the gold standard, which has wrought the ruin, and only charges a small commission of 10 million or so. Great God! that this proud Government, the richest, most powerful on the globe, should have been brought to so low a pass that a London Jew should have been appointed its receiver, and presume to patronize us!

"The encroachments of the Federal Judiciary, and the supineness and venality—corruption, I say—of the representative branches of the Government are causes of deep concern to all thinking and patriotic men. We are fast drifting into government by injunction in the interest of monopolies and corporations, and the Supreme Court, by one corrupt vote, annuls an act of Congress looking to the taxation of the rich."

Even the *World*, while condemning Mr. Tillman's speech, said :

"It is unfortunately true that the relations between the Executive and Wall street have been unduly close; that the Treasury has been managed in the interests of syndicates; that the enforcement of the anti-trust laws has been turned into a mockery; that the attempt to adjust taxation in proportion to wealth has been defeated by a majority decision of the Supreme Court; that the influence of plutocracy is manifest in the composition of the Senate, in the control of legislation, and in the organization of national parties, conventions and campaigns."

For most recent events, see SILVER QUESTION.

Following are the tables giving various statistics as to United States currency, the first showing the present money system of the United States as compiled by G. B. Waldron, of the New York *Voice*, from official sources. It shows the kinds of money in use in the treasury, in national banks, and in circulation July 1, 1895 :

	Gold Coin.	Silver Dollars.	Subsidiary Silver Coin.	Minor Coin.	Gold Certificates.
First authorized	April 2, 1792.	April 2, 1792.	April 2, 1792.	April 2, 1792.	March 3, 1863.
Weight.....	25.8 grains to dollar.	412 $\frac{3}{4}$ grains.	385.8 grains to dollar.	5 c. 77.16 grains. 1 c. 48 grains.
Fineness900	.900	.900	5 c.—75% copper, 25% nickel. 1 c.—95% copper, 5% tin and zinc.

On the basis of an estimated population of 69,878,000 on July 1, 1895, there was a total circulation outside of the Treasury and the National banks of \$1,246,478,805, or \$17.83 per capita.

Concerning the present amount of money in the

United States, the report of the Treasurer for 1894 gives the following statement:

According to the revised estimates the stock of gold, silver, and paper money in the United States on June 30, 1893 and 1894, was composed as follows:

KIND.	June 30, 1893.	June 30, 1894.	KIND.	June 30, 1893.	June 30, 1894.
Gold coin.....	\$519,156,102	\$582,512,083	United States notes.....	\$346,681,016	\$346,681,016
Gold bullion....	78,541,583	44,781,118	Treasury notes of 1890... ..	147,190,227	152,584,417
Silver dollars... ..	419,332,450	419,333,208	National bank-notes	178,713,827	207,353,244
Fractional silver coin.....	77,415,123	76,249,925	Gold certificates	94,041,189	66,387,899
Silver bullion.....	119,113,911	128,764,624	Silver certificates	330,957,504	337,148,504
			Currency certificates.....	12,405,000	60,035,000
			Total paper currency... ..	\$1,109,988,808	\$1,170,190,080
Total coin and bullion ...	\$1,213,559,169	\$1,251,640,958	Aggregate	\$2,323,547,977	\$2,421,831,038

The estimated effective stock of money, which is arrived at by eliminating from the list of paper issues, the certificates of deposit, and Treasury notes, as

merely representative, on June 30 in each of the last five years, was as follows:

KIND.	1890.	1891.	1892.	1893.	1894.
Gold	\$695,563,029	\$646,582,852	\$664,275,335	\$597,697,685	\$627,293,201
Silver.....	463,211,919	522,277,740	570,313,544	615,861,484	624,347,757
Notes.....	532,651,791	514,608,990	519,364,866	525,394,888	554,034,260
Total	\$1,691,426,739	\$1,683,469,582	\$1,753,953,745	\$1,738,954,057	\$1,805,675,218

* By the Government.
 † Total circulation outside of Treasury less amount held by National banks.
 ‡ Acts of July 14, 1875, and April 17, 1876, limited issue to amount required to retire fractional paper currency. This limit was increased to \$50,000,000 by act of July 22, 1876. After resumption of specie payments, 1878, considerable fractional silver reappeared which had been issued previously.
 § Amount outstanding when the act of May 31, 1878, forbade their further retirement.
 ¶ Amount outstanding when the silver-purchasing clause was repealed, November 1, 1893.
 ¶ And reissued by the banks for general circulation.

The following three tables from the Report of the Treasurer give the gold and silver coin and bullion; gold, silver, and currency certificates; United States notes and national and

State bank-notes, and the estimated money in the United States and distribution thereof on July 1 of each year from 1872-94:

* Subsidiary silver, which disappeared from circulation in 1862, was reintroduced under operation of the act of January 14, 1875.

† Silver certificates were authorized by acts of February 28, 1878, and August 4, 1886.

Treasury Notes Act, July 14, 1890.

The following two tables give the total coinage of the United States mints from 1793 to 1895, as given in the reports of the Director of the Mint, and the money in circulation since 1872. For the per capita circulation before 1872, see CONTRACTION AND EXPANSION OF CURRENCY, and see also that article for questioning

the correctness of the showing made in these reports. Note also that the currency certificates (act of June 8, 1872) are included in the amount of United States notes in circulation in the tables for the years 1873 to 1891 inclusive; since 1891 they are reported separately.

* State bank-notes ceased to circulate after passage of the act of February 8, 1875, which laid upon them a tax of 10 per cent. They were not receivable for public dues, and therefore do not appear among the funds in the Treasury.

The following is the coinage of the silver dollar :

1793-95.....	\$204,791	1843.....	\$165,100	1861.....	\$78,500	1879.....	\$27,560,100

CURTIS, GEORGE WILLIAM, was born in Providence, R. I., February 24, 1824. His father, a business man, desiring him to continue in his footsteps, placed him in an importing house in New York City. A year later, however, the son threw off the restraints of this un-

congenial life, and with his elder brother joined the community at Brook Farm, Mass., being the youngest member of that distinguished company. Mr. Curtis remained four years at Brook Farm, going thence with his brother to Concord, Mass., where they lived for two years, keeping up the admiring friendship he had formed with Emerson, Hawthorne, and others.

In 1846 Mr. Curtis went to Europe, and during his travels contributed letters to the *New York Tribune*. On his return, in 1851, he became connected editorially with that paper. In 1852 he became one of the editors of *Putnam's Monthly*, and when it passed into the hands of a firm that failed, he paid off the debt, tho it took 16 years. In 1853 he began a career as a lyceum lecturer, and soon became one of the most popular speakers of the day. The ele-

gance and dignity of his manner, the melody and sympathetic quality of his voice, the grace and easy flow of his language, made him a general favorite. In 1856 he was married to Anna Shaw, daughter of Francis George Shaw, the philanthropist. In 1857 he became permanently associated with the Harpers, as editor of the "Easy Chair," the remarkable series of papers which he had commenced in 1853. The previous year he had become chief editorial writer for *Harper's Weekly*, a position he held till his death.

In 1860 Mr. Curtis was a delegate to the convention that nominated Mr. Lincoln, and in *Harper's Weekly* and on the platform he enthusiastically advocated the cause of the Union and emancipation.

In 1864 he was again delegate to the National Republican Convention, and was candidate for Congress in the First New York District, but was defeated. In 1867 he was delegate to the convention for revising the Constitution of New York State. In 1868 he was a Presidential elector on the Republican ticket. We now come to his great work for civil service reform, when,

in 1871, General Grant appointed him one of the commissioners to draw up rules to regulate the civil service. Yet in 1876 Mr. Curtis opposed the renomination of President Grant for a third term. In that year a civil service league had been formed in New York State, and in 1880 it was revived, and Mr. Curtis became its president. This was superseded a year later by the National Civil Service Reform League, which was essentially of his organization. In the same year Mr. Curtis supported General Garfield's candidacy for President, being again a delegate to the National Republican Convention, and in 1884 he again held a seat in that body, working earnestly against the nomination of Mr. Blaine. In 1890 he became Chancellor of the University of the State of New York, of which he had been a regent since 1864. He died at his home on Staten Island, August 31, 1892. His best-known works are: *Nile Notes of a How-adjji* (1851); *Lotus Eating* (1852); *Potiphar Papers* (1853); *Trumps* (1862); *Eulogy on Wendell Phillips* (1865); *Motley's Correspondence* (1890); *From the Easy Chair* (1892).

D.

DANGEROUS TRADES.—The study of dangerous or unhealthy trades and occupations has been carried to a much further extent in England than in this country. Particularly does Dr. Arlidge's exhaustive work on *The Diseases Incident to Various Occupations*, published in 1892, give us the fullest information. From a study of this great work and similar sources in a tract on *Dangerous Trades*, published by the Humanitarian League of England, we abridge the following account:

"In the white-lead trade, pre-eminent for its fatal effects upon the workers, dust is a constant factor in their lives, and they are continually exposed to the influence of the deadly 'saturnine' poisoning. That lead is highly poisonous is no new discovery. Its effects were well known to the ancients. Yet in this trade the roughest and most dangerous part of the work is done by women, as it needs less muscular strength than work which is far less perilous.

"This will readily be understood by a glance at the process of white-lead making; the deadly white carbonate being manufactured from the ordinary blue lead.

"It is mostly women of the very poorest and roughest class who offer themselves to work in the white-lead factory. The widow who has a family to support, the wife of a drunken husband, the girl whose character will not bear scrutiny"—these are the applicants for employment.

"Here, after a varying degree of exposure, she becomes anæmic. It may be that her gums show a very faint blue line, or perchance her teeth and gums are perfectly sound, and no blue line is discernible. Coincidentally with the anæmia she has been getting thinner, but so gradually as scarcely to impress itself upon her or her friends. Sickness, however, ensues, and headaches, growing in intensity, are developed. These are frequently attended by obscuration of vision or temporary blindness. Such a girl passes into what appears to her friends and medical adviser as ordinary hysteria. This gradually deepens without warning, until she is suddenly seized with a convulsion, beginning in one half of the face, then involving the arm, next the leg of the same side of the body, until the convulsion, violent and purely epileptic in its character, becomes universal. This is attended by loss of consciousness, out of which she passes into a series of convulsions, gradually increasing in severity, in one of

which she dies; or consciousness, partial or perfect, is regained, either, it may be, for a few minutes, a few hours, or days, during which violent headache is complained of, or she is delirious and excited, as in acute mania, or dull and sullen, as in melancholia, and requires to be roused, when she is found wandering, and her speech is somewhat imperfect. Without further warning, save that the pulse, which had become soft, with nearly the normal number of beats, all at once becomes low and hard, she is suddenly seized with another convulsion, in which she dies, or passes into a state of coma from which she never rallies. In another case the convulsions will gradually subside, the headache disappears and the patient recovers, only to find that she has completely lost her eyesight—a loss that may be temporary or permanent."

Yet tho the trade is so dangerous, governments have declined to interfere.

Says Mr. Vaughan Nash: * "The children of the white-lead worker enter the world, as a rule, only to die from the convulsions of lead-poisoning; they are either born prematurely, or die within the first year. These facts have been brought before the country from time to time. Professor Oliver has appealed to the British Association to do something on behalf of these unfortunate people; but the Home Office still continues its inadequate precautions, and its inspection of the lead-poisoned. What, we may ask, is the good of scheduling a trade as dangerous, and drawing up special rules, if this sort of thing is to be the outcome of it? . . . The duty of drying up such poison springs as these carbonate of lead works, the evil effects of which are only begun when the fatal white powder sets off on its journey to the potteries, the house painter, and the artist, seems too clear to be disputed. Various substitutes are in the market, and the Home Office should at once undertake an investigation into their merits with a view to enforcing a safe process."

Of the phosphorus trade we are told:

"Probably but few people are aware of the conditions under which this industry is carried on, or realize that in their endeavors to save an occasional penny they are dooming numbers of their fellow-creatures to agonizing sufferings and to death by slow torture; still less do they realize the urgency of this question. The peril is steadily growing, for the sale of phosphorus matches is increasing, and that of the Swedish safety matches proportionately diminishing. The cheapest

**Phosphorus
Trade.**

kind of matches (those bought by the very poor for one penny per dozen boxes) are tipped with the common white phosphorus, a substance which is prepared from powdered bone ash by mixing it with sulphuric acid.

"This dangerous substance, even when kept under water, gives off deadly fumes, and nothing can protect the workers who handle it, and those who work in the room with it, from their influence.

"The women who use it begin after a time to suffer from toothache. They think lightly of it, perhaps have some decayed teeth extracted, and go on with their work. The pain, however, continues and increases—first the jaw and then the whole face swells up, and the sight on this side of the face is often affected.

"The pain is agonizing. I have heard it described by a sufferer as a 'gnawing and tearing' pain; it is, in fact, the pain of cancer. The jaw gradually becomes green, then black, and it begins to discharge; and now the odor of the wound becomes offensive to those who share a room with the sufferer.

"Death ensues after much suffering, and both before and after death the jaw is seen, if examined in a dark room, to be alight and phosphorescent."

Of other trades the same source says :

"If we look for a moment at one of the largest and oldest established trades, one of the most necessary to the existence of a civilized community—the linen trade—we find bronchitis, pneumonia, severe rheumatism, much more than usually prevalent, in consequence of the frequent wet feet and wet clothes of the workers engaged in deal-

Other Trades.

ing with the flax, which has to be left to soak in stagnant water.

"In the preparing and carding departments, however, the mischief is even more serious, for there the dust which is inhaled is so fine and of such an irritating character that, according to Dr. Arlidge, in the vast majority of instances it produces lung disease; so that a woman who starts carding at 17 or 18 usually begins to break up at 30.

"The chemical laborers—such, for instance, as are employed in the works of the United Alkali Company, and who are picked from the very strongest and most splendidly built men to be found—do not live as a rule to be 48.

"Glass-blowers, who are exposed to more than tropical heat, when still under 40 years of age are pale and thin, prematurely old and worn out, and suffer from headache and giddiness, great prostration, and occasional blindness.

"It is amply proved that 'only by a compulsory reduction of hours can adequate relief be obtained for the chemical workers.' Plumbers and painters suffer from a high death-rate, which is mainly determined by their liability to lead-poisoning. And we know that printers, tailors, shop assistants, bakers, and bookbinders often work in so close and vitiated an atmosphere that their health is impaired and their lives are shortened.

"Another dangerous industry is the trade of fur-cape-making, which is carried on by women in private workshops. The characteristics of this trade are the existence of an offensive smell, prejudicial to health, arising from the skin of the animals used in trade, and also the constant presence in the atmosphere of an irritating stuff, which invades the nostrils and air-passages and hinders respiration.

"Again, artificial-flower-makers suffer much from the strain upon their organs of sight caused by the making of white flowers at night by gaslight. Chronic inflamed eyelids are common with them, as a consequence of using the dry colored dust which surrounds them while they work. And the life is so trying that before they reach the age of 40 they are prematurely old and worn out.

"Again, in the china trade, the dust is extremely injurious to the health of the china scourers and towers. This dust consists of extremely minute particles of flint, the jagged edges of which injure the lungs. The towers, whose business it is to put a fine surface on the revolving plate by means of sandpaper, are exposed to the constant play of the clay dust. 'It is rare to find a woman who has worked for any time either as a tower or china scourer who is free from respiratory troubles.' The scourers, who are always women, and the rougher, more ignorant and reckless of their sex, have to brush and beat off the dust from the chinaware after its removal from the saggars. Statistics tell us that the percentage of deaths in phthisis and respiratory diseases among all classes of

male workers in the potteries is three times as great as among all other adult male workers.

"Speaking of the potter's trade, Dr. Arlidge writes (p. 177) thus: 'All who deal with the clay suffer more or less. Potter's dust does not kill suddenly, but settles, year after year, a little more firmly into the lungs, until at length a case of plaster is formed. Breathing becomes more and more difficult and depressed, and finally ceases.'"

For conditions in still other trades we turn to an account prepared by Mr. Vaughan Nash, and published in the *Cooperative Wholesale Annual* for 1893. Of the Sheffield cutlery trade, he says :

"Every one is proud of Sheffield, and its manufacturers boast that wherever the British flag flies there is Sheffield trade; and when it flies for war, Sheffield steel is not far off. It has a school of protection of its own for Sheffield goods, so keen is the pride it takes in its cutlery. But what a life the Sheffield workman lives who earns his bread at the grindstone! Here is what the medical officer for Sheffield says about the place where these men live and work :

"Houses of the poorest description, with damp walls and cellars, in many instances standing several inches deep in water, contaminated with sewage and giving out foul gases into the rooms above; courts confined and occupied by large, sodden privy-middens so near to the dwellings that ventilation becomes impossible and absolutely dangerous; sink pipes discharging in the channels, usually defective, and allowing the slops to form stagnating pools before reaching the gullies which are situated often 50 yards away; or, what is worse, permitting of percolation into the soil of the yard. All these conditions exist in many parts of the district, and no doubt are largely accountable for the high death-rate. At present almost every available foot of ground is occupied, if not by houses by privies, stables, or outhouses; the air is stagnant and the ground polluted with sewage and decomposing matter."

"Hundreds of these wretched jerry-built slum houses have been turned into workshops in which the grinders and cutlers stoop over their wheels. Somewhere in the court a gas engine is working, and a network of bands are connected with the wheels which whiz around in every dark hole and corner that they can be squeezed into. You go up rickety ladders into lofts where the boards are worn and covered with an ancient grime of steel and stone particles of file dust and filth. Here you will find women finishing off the men's work. Very likely the water comes through the roof when it rains and lays the dust. The grinders and cutlers rent these places. They enjoy the privilege of freedom, which, in this case, is one of the strangest and most ghastly privileges men could claim. They have their own wheels and their own tools. They pay so much rent for the place, so much rent for the gas, and so much rent for the power; meanwhile, the manufacturer, so called, sits in his warehouse or office giving out steel in the rough, first to the forger, who passes it to the grinder, and so on to the polisher and finisher until the round is completed and the finished stuff comes back into the other door 'warranted best Sheffield cutlery.' The trade is a highly skilled one, and the work is extremely hard. The wages run from 16s. for light grinders, to 25s. for heavy grinders. The wages of Sheffield are literally death. The lungs of the cutler and grinder get charged in the course of time with the metallic particles given off during their work, and they contract that form of phthisis locally known as 'grinder's rot.' These particles, owing to their mineral constitution and sharp jagged outline, are peculiarly harmful, and at last the lungs can stand it no longer and cease work.

"If the 131 grinders who died in the year 1890 had shown the average health conditions of the country, not 92 but 27 ought to have died from phthisis and respiratory diseases. The figures show how terribly large is the proportion of these diseases to the total number of deaths, and yet Dr. Littlejohn, the Medical Officer of Health, asserts that they fall far short of the actual facts, as many workmen at the cutlery trade when their health begins to fail go into some lighter occupation, under which their deaths are registered."

Of another trade he says :

"In the alkali works we come across an entirely different class of labor. With the exception of the men employed in the construction of public works, there is probably no finer set of workmen to be found in the country than those in the employment of the great corporation known as the United Alkali Company. This company has acquired nearly all the chemical works in the country, and it employs something like 20,000 men.

Alkali Works.

The conditions under which these men work have been so fully brought before the public of late in the press and before the labor commission, that it is unnecessary to deal with their case at length. A distinctive feature about the trade is that it wears out the workmen prematurely because of the intensity of the toil, the alternations of heat and chill, and most of all the exposure to noxious vapors. The traveler who passes through Widnes, even in an express train, draws up the window to keep out the choking sulphurous fumes. These centers of the chemical industry are in truth 'hell-holes' for those who have to live and work in them. Taking one week with another, most of the men do their 12 hours a day in the works, and taking one man with another, their life is over by the time they are 47.* The gases and vapors which do the mischief bring on bronchitis, and in the winter-time the hospitals and workhouses are full of patients from the chemical works. The men who work on what is called 'salt-cake' have their teeth rotted away in the course of time by the hydrochloric acid gas; others suffer from contact with vitriol; others again do their work in air which is filled with stinging caustic; the men in the 'lime-house' constantly get burned by the action of the perspiration of the lime particles which settle on their bodies; and worst of all, bleaching-powder men suffer daily semi-suffocation and bodily torture of a dreadful kind in the chlorine chambers, which they enter with their mouths swathed with a huge protuberance of flannel. Nothing could be more barbarous and crude than the labor conditions in these works."

In the United States the reports of the New Jersey Bureau of Labor Statistics for 1889, 1890, and 1891 are almost the only adequate study of dangerous trades. These reports study the pottery, hat-making, and glass-blowing trades. Of the pot-makers, the investigator says he has seen the decay of three generations within 40 years. Among the hatters, out of 240 sizers or makers, 76 had catarrh, 44 rheumatism, 41 coughs, 17 had had and 13 then had "the shakes," 12 constantly caught cold, 7 were dyspeptics. The workmen paid little attention to the conditions under which they worked; 200 of

the number used tobacco or stimulants in some form.

In the United States one of the most dangerous trades is work upon railways, particularly the work of brakemen, in coupling and uncoupling cars not provided with modern couplings, and on walking on freight cars without proper defenses. During the year ending June, 1892, there were 2554 employees killed and 28,268 injured, which is 1 for every 29 employed. Of trainmen, 1 man was killed for every 113 employed, and 1 was injured for every 10 employed (*Interstate Commerce Commission Report*, 1892, pp. 68, 73, 78).

For statistics as to mortality in different trades and the difference between the death-rates of the working class communities and wealthy communities, see DEATH-RATES. For the dangers of machinery to the life and limb of children, see CHILD LABOR, section "United States."

DANTE AND SOCIAL REFORM (1265-1321).—The great Italian poet we consider here simply in his influence on the social movement of his day. But this was not small. As is well known, he took an eager part in public affairs. Altho of a family traditionally Guelph, he was a Ghibelline, favoring the Empire against the Church, and therefore, for what he believed to be the deepest good of Florence and Italy, opposing the popular party. It was as a result of the strife and intrigues arising out of this controversy that he was expelled from Florence, and given the bitter, sad, noble life out of which has come his great, mystic, and unfathomable song. His one great work on social themes is his *De Monarchia*, written in Latin in rigid dialectical method, perhaps about 1302, tho more probably later. In any case, it represents his mature Ghibelline views. He asks three great questions concerning the Roman Empire (*De Monarchia*, I., II.): 1. Whether it was necessary for the welfare of the world. 2. Whether the Roman people took to itself by right the office of monarchy or empire. 3. Whether the authority of monarchy comes from God directly or only from some other minister or vicar of God. He believes that the authority of the empire came from God direct; he advocates the theory which became the ruling thought of the Middle Ages, and which has affected all European history—that the empire and the Church are two parallel coordinate powers, both divine, both owing respect, but neither owing obedience, to the other. It is this ideal that is revived in the German ideal advocated by Bismarck—*e. g.*, of the Christian State. (See GERMANY.)

DANTON, GEORGE JACQUES, was born in France at Arcis-sur-Aube, in 1759. Of a respectable family, he received a good education and entered the practice of the law in Paris. Of radical views, he was one of the leaders of the club of the Cordeliers, which was from the first the center of the extreme popular party in the French Revolution. Danton became prominent in the Revolution in 1792. He is credited with instigating the rising of the bloody insur-

* I make this statement on the authority of the medical officer of health for St. Helen's, who has kindly supplied me with the figures.

rection of August 10 of that year, which began the Reign of Terror. The next day he was raised to the post of Minister of Justice. On September 2, when Paris was in a panic, Danton made a bold, powerful speech in the Assembly, closing with the words, "Dare, dare again, and forever dare." That evening several hundred prisoners were massacred in the prisons. His admirers claim that Danton adopted this attitude because he believed that a little audacity on the part of the people then would really in the end most preserve life as well as liberty. As a member of the convention he joined the Mountain, as the extremists were called, and voted for the death of the king. He was prominent in the establishment of the revolutionary tribunal; was a member of the Committee of Public Safety; aided in overthrowing the Girondists (*q.v.*); but was not a member of the new Committee of Public Safety, being unable to approve their excesses. He could not, however, prevent them, and fell into a sort of apathy till at last Robespierre moved against Danton. He was brought before the Tribunal, sentenced and guillotined April 5, 1794.

Reference: Gronlund's *Ca Ira, or Danton in the French Revolution*, gives the favorable view of Danton. (See also FRENCH REVOLUTION.)

DARKEST ENGLAND SCHEME. See SALVATION ARMY.

DARWINISM. See EVOLUTION AND SOCIAL REFORM.

DAVITT, MICHAEL, was born of poor Irish peasants, in 1846, in the village of Straide, Mayo County. When five years old he saw his parents evicted from their home. The family emigrating to Lancashire, he was employed in a cotton mill, and at the age of 11 lost his right arm through a machinery accident. He then attended school at Harlingden until 15, when he obtained work in a printing-office, remaining seven years. He joined the Irish movement in 1866, and was arrested on charge of treason in 1870, and sentenced to 15 years of penal servitude. After seven and a half years he was released on ticket of leave. After a tour of the west of Ireland and a visit to America, he returned to his native country. In 1879 he started the land agitation, and in conjunction with Mr. Parnell and others founded the Land League; and because of his connection with this movement has endured nine years' imprisonment. His third arrest was in November, 1879, when a week's imprisonment followed. He was again arrested February 3, 1881, on revocation of his ticket of leave, but after 15 months was again released on ticket of leave, and was accorded a reception by Mr. Parnell and the Irish leaders. In February, 1883, he was once more arrested for a speech against rent and landlordism, and was incarcerated four months. While in prison in Portland in 1882 he was elected M. P. for Meath, but was disqualified by vote of the House of Commons. He also wrote, while in prison at Portland, *Leaves from a Prison Diary*, publishing it in December, 1884.

In 1880 he superintended the organization of the American branch of the Land League, mak-

ing a tour from New York to San Francisco and back. He had the chief direction of the Land League funds during the famine of 1879-80. He is a constant contributor to American and colonial newspapers, and Irish and English reviews and journals. He has pronounced views on land nationalization, and has not only written in its advocacy, but has made many speeches in its favor. He is almost the only one of the Irish leaders who does thus advocate industrial as well as political reforms. In 1890 Mr. Davitt, siding with Mr. Gladstone, demanded the retirement of Mr. Parnell (*q.v.*) because of his proven immorality, Mr. Davitt believing that this was the only way to save the Home Rule cause. The conflict in the Irish Party and in Ireland became bitter, but Mr. Davitt found a large following, and in 1892 was returned to the House of Commons as member for North Meath. In the late election (1895) he was again returned.

DEAF AND DUMB INSTITUTIONS.—The first public institution for the deaf was opened in London, England, in 1792, tho in 1760 Abbé de l'Épée, in Paris, and Thomas Braidwood, in Edinburgh, had gotten together classes of the deaf and dumb. The first institution of the kind in America was opened at Hartford, Conn., in 1817, owing to the efforts of Dr. Gallaudet. To-day there are in the United States 49 public boarding-schools for the deaf, 12 public day-schools, and 19 private schools, with 757 instructors and 9104 pupils. In England and Wales in 1881 there were 2713 deaf-mute children at school, with 22 public institutions and many private ones. Germany had 90 schools; France, 60; Italy, 55; Europe and America over 300. The aim of these schools is to teach sign language, finger speech, writing, oral speech, general education, and useful arts. Their success has been among the marvels of science and humanity.

DEATH PENALTY.—The infliction of the death penalty has existed among all peoples and in all times. Only recently has there been any serious agitation for its abandonment. In the earliest times and through the Middle Ages it was often accompanied with the most terrible tortures that the mind of man could conceive. Death on the wheel, by quartering, by flaying alive, by burning, by crucifixion, by immersion in boiling oil, by disemboweling—these were but a few of the simpler methods. The death penalty was in former times inflicted for all manner of crimes. It was once the ordinary punishment for all felonies; in England it was the certain doom of all who could not avail themselves of benefit of clergy—*i.e.*, it was inflicted on all who could not write. Moreover, numerous acts of Parliament created felonies without benefit of clergy. Things grew worse rather than better. Llorente estimates the number that were buried alive under the Inquisition alone at 31,912. Rowe divides this by 10. Protestant England has her shame. Blackstone mentions 160 offenses as punishable by death. Four fifths of these had been added during the reign of the first three Georges. Among these offenses were stealing in dwelling-houses to the amount of 40s.; stealing in a shop to the value of 5s.,

counterfeiting stamps used in the sale of hair powder and perfumery. In the latter part of the reign of George III., due to the efforts of Sir Samuel Romilly, much of this was abolished. Yet has capital punishment been defended in all times and by the greatest philosophers. The Mosaic and the Germanic law allowed retaliation—a life for a life. Plato argued only for its limitation to incorrigible culprits, to whom life was not the most advantageous state, and whose death would serve the public good. Grotius treats the question from a religious point of view, basing his argument on the laws of Moses. Montesquieu defends it as a sort of retaliation by society, based on the nature of things. Rousseau, following Hobbes, defends it on the ground that the criminal is a rebel to the social contract. Kant says that in the social contract man consents to the penal law, and so can be put to death. Beccaria (*q.v.*), in his *Essay on Crimes and Punishments* (1775), was the first to argue for its total disuse. He did so on the ground that society had no right to take away life, since it did not give life, and that it was not the punishment most deterrent to crime. Bentham argued that it was the most deterrent. Romilly argued that if it is not the supreme penalty, and society has the right to inflict worse penalty, it surely has that right. The main arguments for capital punishment have been based on the absolute justice of demanding life for life, on Scripture warrants, and, above all, on the asserted teaching of experience that the death penalty is actually the most deterrent punishment, and therefore the most effective. Men have striven to show that where the death penalty has been abolished murder has decreased. This, on the other hand, is strenuously denied; and the argument against the death penalty is based on the denial of the right of the State to take life, on Christian charity, and, above all, on the claim that it works evil, brutalizes the community, making it think life cheap, even adding a horrible fascination to murder, and delivering juries from convicting murderers, etc.

In the United States the death penalty may be given in most States for treason, murder, arson, rape, piracy, robbery of the mails with jeopardy to life, rescue of a convict going to execution, burning a vessel of war, and corruptly destroying a private vessel. It has been abolished in Michigan (1846), Wisconsin (1852), Rhode Island (1852), Iowa (1877), Maine (1887), and New York; but has been restored in Iowa and New York. In 1888 the latter State substituted death by electricity for hanging.

In Europe it seems going out of use. In Holland there have been no executions since 1860, and the penalty was abolished in 1870. In Roumania it was abolished in 1864; Portugal has done the same. Switzerland did so in 1874, but murders increasing, in 1879 the cantons re-established it where the canton so votes. It remains abolished in 15 cantons. From 1870-79, of 805 persons sentenced to death in Austria, only 16 were executed; in Sweden, only 3 out of 32; in Norway, 3 out of 14; in Denmark, 1 out of 94; in Bavaria, out of 249 committed for murder, only 7 were executed. In North Ger-

many, from 1869-78, 1301 were convicted of homicide, 484 sentenced, but only 1 executed—Hödel, who attempted the assassination of the Emperor. The death penalty for political crimes is all but universally abolished. The French Revolution of 1830 declared for this, and it was abolished in France by the Constitution of November 4, 1848, and the law of June 8, 1850. In Russia it has been retained only for treason and military insubordination. For the principles involved, see PENOLOGY.

Romilly (1840)*; Jeremy Bentham's *Rationale of Punishment (1830)*; Report of Select Committee on Capital Punishment, New York State Assembly (1851); Beccaria's *Essays on Crimes and Punishments (1775)*.

DEATH-RATE.—For the subject of death-rate and of birth-rate compared together, see the article BIRTH AND DEATH-RATES, prepared for this cyclopedia by Dr. S. W. Abbott, of the Massachusetts State Board of Health. We give in this article some supplementary information gathered from various sources. The report of the Registrar-General of England for 1893 gives the following table of the death-rate of different countries per 1000 of the population (excluding the still-born):

	AVERAGE, 1871-90.		1893.	
	1891.	1892.		
Hungary (15 years)....	33.7	33.1	35.0	31.1
Austria.....	30.6	27.9	28.8
Italy.....	28.6	26.2	26.3	25.3
Germany (19 years)....	26.0	23.4	24.1	24.6
Prussia.....	25.6	22.9	23.4	24.2
France.....	22.8	22.6	22.6
Holland.....	22.6	20.7	21.0	19.7
Switzerland.....	22.1	20.8	19.3	20.5
Belgium.....	21.4	21.0	21.8	20.3
Scotland.....	20.4	20.7	18.5	19.4
England and Wales....	20.3	20.2	19.0	19.2
United Kingdom.....	19.6	20.0	19.0	19.1
Denmark.....	19.0	20.0	19.4	18.9
Ireland.....	18.0	18.4	19.4	17.9

Concerning the death-rate of the United States, Professor Mayo-Smith (*Statistics and Sociology*, pp. 148, 133.) says:

"The death-rate in the United States is very difficult to estimate, owing to the absence in most of the States on any adequate registration. The total number of deaths reported as having occurred in 1890 was 875,521, giving a death-rate of only 13.98 per 1000. In some States and cities the registration returns were used, and there we have a death-rate of 20.27 per 1000; while in those States where the returns of the enumerators of the Eleventh Census were alone used, the death-rate was only 10.79 per 1000. Estimating the returns as deficient by 30 per cent., we have a death-rate for the whole country of about 18 per 1000. . . .

"The census of 1890 gives a death-rate of

17 for native-born whites of native parentage ; 24.42 for native-born whites of foreign parents ; 19.85 for foreign-born whites ; and 19.57 for the colored. The excessive rate among the native-born whites of foreign parentage is due to the large number of children in that class. The death-rate of the colored is a trifle less than that of all the whites ; but in the cities the death-rate of the colored is 34.52, while that of the whites is 23.22.

" Jews show everywhere a small death-rate. Thus in Bavaria in 1876 the death-rate for Prot-

estants was 25.5 ; for Catholics, 32.2 ; for Jews, 18.8 ; average for the whole country, 30.3. The low rate for Jews is due partly to their lower birth-rate. In Prussia it was shown that while they were 13.25 per mille of the population, they were only 7.28 per mille of those dying over the average of 15. This shows the preponderance of the Jews in the upper age class."

The mortality in various American States and cities can be seen by the following table of deaths in the census year 1889-90, based on the returns prepared for the *World Almanac*, 1892 (p. 167), by the Census Office :

STATES AND TERRITORIES.	Total Deaths.	WHITE.*		Colored.	UNDER FIVE YEARS OF AGE.	
		Native Born.	Foreign Born.		White.	Colored.
Alabama	20,898	9,215	320	10,591	3,880	3,847
Arizona	573	301	169	30	130	3

Totals	1872,044	596,055	140,075	114,313	264,784	41,911

The death-rate of each State and of each portion of the community can be ascertained by comparing the number of deaths with the population. (See POPULATION.) But before compar-

isons are made, see the caution suggested on page 469 ; see also STATISTICS. For the causes of death in the United States, see the next page.

* Including birthplace unknown ; total number, 22,501.

* According to Census Bulletin on Statistics of Cities.

Professor Mayo-Smith quotes from News-holme's *Vital Statistics*, p. 143, the death-rate in 1887 for all England and Wales as 19.1, but for 28 large towns, 20.8, while for Manchester it was 28.7; Preston, 27.9; Newcastle, 25.3; Brighton, 16.9; Derby, 17.1; Nottingham, 18.7; London, 19.6; Glasgow, 24.7.

For Germany, he quotes the *Allgemeine Statistische Archiv*, 1890, p. 164, with a death-rate in 1880-85 for all the empire of 27.2, with a high rate from 31.6 to 33.2 for such cities as Munich, Königsberg, and Breslau, while in Frankfurt it was only 19.7; Hanover, 21.9; Bremen, 21.8; Stuttgart, 23.5; Leipsic, 24.1; Berlin, 27.8. Mr. A. R. Conkling, however, in *City Government in the United States*, says that Berlin has reduced her death-rate to about 20. Mulhall puts the death-rate of Paris at 28.6.

In regard to infant mortality, the *Statistik des Deutschen Reichs*, No. 44, p. 71, gives the following table (as quoted by Professor Mayo-Smith) of the proportion who die in the first year out of each 100 born living :

In Bavaria.....	30.6	In France.....	16.6
European Russia..	29.6	Great Britain.....	14.5
West Austria.....	25.6	Denmark.....	13.8
Italy.....	21.4	Sweden.....	13.0
Prussia.....	21.2	Norway.....	10.4
Holland.....	20.3	Ireland.....	9.7

Concerning the causes of death, the *World Almanac* gives the following tables, based upon the Eleventh Census for the United States, and upon Mulhall for European countries :

CAUSES OF DEATHS IN THE UNITED STATES IN THE CENSUS YEAR 1889-90.

Scarlet fever	5,969
Measles.....	9,256
Whooping-cough.....	8,432
Diphtheria and croup	41,677
Enteric fever.....	27,058
Malarial fever.....	18,594

Cancer.—Mental worry, says Dr. Herbert Snow, of the Cancer Hospital, is the chief exciting cause of cancer. In 1888 in England the number of deaths from cancer was 17,506, of which 6284 subjects were males and 11,222 females.

Phthisis or Consumption.—Among 100 people of each trade, the ratios of those suffering from it were : Needle-makers, 70; filemakers, 63; lithographers, 48; tobacconists, 37; watchmakers, 37; stonemasons, 36; glassworkers, 35; hairdressers, 32; weavers, 25; painters, 25; printers, 22; shoemakers, 19; glaziers, 18; hatmakers, 16; carpenters, 14; masons, 13; millers, 11; brewers, 11; tanners, 9; bakers, 7; butchers, 7; charcoal-burners, 2; miners, 1.

Concerning the terrible relation between overcrowded cities, low industrial conditions, and high mortality, we have abundant testimony. Mr. J. A. Hobson (*The Evolution of Modern Capitalism*, p. 334) gives the following table of the death-rate in town and country districts of England, 1851-90 :*

YEARS.	ANNUAL DEATHS PER 1,000.			Deaths in Town Districts to 100 Deaths in Country in equal Numbers Living.
	England and Wales.	Town.	Country.	
1851-60...	22.2	24.7	19.9	124
1861-70...	22.5	24.8	19.7	126
1871-80...	21.4	23.1	19.0	122
1881.....	18.9	20.1	16.9	110
1882.....	19.6	20.9	17.3	121
1883.....	19.5	20.5	17.9	115
1884.....	19.5	20.6	17.7	117
1885.....	19.0	19.7	17.8	111
1886.....	19.3	20.0	18.0	111
1887.....	18.8	19.7	17.2	115
1888.....	17.8	20.9	17.4	114
1889.....	17.9	19.3	16.4	118
1890.....	20.9	17.4	120

Of this he says: "As matters stand at present, the statistics above quoted do not mark the full extent of the difference of healthfulness in town and country. When allowance is made for age and sex distribution in town and country population, the difference in death-rate appears much greater. For in the towns are found (a) a much larger proportion of females; (b) a larger proportion of adults of both sexes in the prime of life; (c) a much smaller proportion of very aged persons;† hence if conditions of health were equal in town and country, the town death-rate would be lower instead of higher than that of the country. The *Report of the Census of 1881*‡ calls special attention to this point, which is commonly ignored in comparing death-rates of town and country. 'If we take the mean (1871-80) death-rates in England and Wales at each age-period as a standard, the death-rate in an urban population would be 20.40 per 1000, while the death-rate in the rural population would be 22.83. Such would be their respective death-rates on the hypothesis that the urban districts and the rural districts were equally healthy. We know, however, as a matter of fact that urban death-rates, instead of being lower than rural death-rates, are much higher. The difference of healthiness, therefore, between the two is much greater than the difference between their death-rates.'

"The same facts come out in comparing Paris with the rest of France. At each age the death-rate for Paris is higher than for France.

AGE. §	Paris, 1886.	France, 1877-80.
0 to 1 year.....	230 ?	170 ?
1 to 5 years.....	58.2	28
15 to 20 years.....	9.1	6
30 to 40 years.....	13.6	10
60 to 70 years.....	51.2	41

"The English statistics indicate a slight and by no means constant tendency toward a diminution of the difference between town and rural mortality, due, no doubt, to improvements in city sanitation and to some general elevation of the physical environment and standard of living among a large section of the working classes. The same slight tendency is visible in France. During the period 1861-65 the urban death-

rate was 26.1, as compared with 21.5, the rural death-rate; during the period 1878-82 the rates were respectively 24.3 and 20.9."*

The real meaning, however, of the high mortality of towns comes out, not in general statistics, but in definite comparisons between crowded and less crowded quarters, between districts of the poor and districts of the well-to-do. Says Dr. C. R. Drysdale (*Report of Industrial Remuneration Conference*, p. 130):

"At present the average age at death among the nobility, gentry, and professional classes in England and Wales was 55 years; but among the artisan classes of Lambeth it only amounted to 29 years; and while the infantile death-rate among the well-to-do classes was such that only eight children died in the first year of life out of 100 born, as many as 30 per cent. succumbed at that age among the children of the poor in some districts of our large cities. The only real cause of this enormous difference in the position of the rich and poor with respect to their chances of existence lay in the fact that at the bottom of society wages were so low that food and other requisites of health were obtained with too great difficulty."

Death-rates of Rich and Poor.

Dr. Playfair says that 18 per cent. of the children of the upper class, 36 per cent. of those of the tradesman class, and 55 per cent. of those of the workmen die before they reach five years of age (quoted at p. 133 of *Dictionary of Statistics*, by Mr. Mulhall, who, however, thinks it "too high an estimate").

The infantile death-rate at Bethnal Green is twice that of Belgravia. Holborn (151,835) and St. George's, Hanover Square (149,748), have almost equal populations; yet in the former 1614, in the latter only 1007 children under five died in 1884 (*Registrar-General's Report*, 1886, pp. 32, 126, C-4722).

Some of this high death-rate is due to trade conditions, but mostly to town conditions. Says Mr. Hobson (*idem*, p. 337):

"The statistics of infant mortality are conclusive upon this point. In comparing the death-rates for town and country, the difference is far wider for children below the industrial age than for adults engaged in industrial work. Mr. Galton has calculated that in a typical industrial town the number of children of artisan townfolk that grow up are little more than half as many as in the case of the children of laboring people in a healthy country district."

A high death-rate is largely, however, the result of poverty in city or town. In Paris, the rich quarters of the Elysée and the Opéra had a death-rate of 13.4 and 16.2 when Ménilmontant, a poor quarter, had a death-rate of 31.3 (Levasseur, *Pop. Française*, vol. ii., p. 403). The comparative mortality in different trades has been tabulated by Newsholme (*Vital Statistics*, pp. 156, 157) in the following way:

(The comparative mortality figure in the last column indicates how many deaths occur out of the same number in the given occupation as in the number of the average population in which 1000 deaths occur. Thus, in the average population, 1000 annual deaths occur per 64,641 males, ages 25 to 65, of whom 41,920 were under and 22,721 were over 45 years of age. The figure for clergymen, 556, represents the mean mortality of the clergy between 25 and 65, as compared with the mortality of all males of similar ages in England and Wales.)

Commenting on the statistics in his *American Charities*, p. 111, Professor Warner says:

"The mortality in a given occupation may be high, not because the occupation is unhealthful, but because persons of poor health are likely to resort to it.

"But the entire story regarding the degenerative influences brought to bear upon the weaker classes of the community is not brought out by the study of occupational mortality. We must turn to the matter of class mortality in order to obtain this. In his work on *The Rate of Mortality, etc., in the Upper and Professional Classes*, Mr. Charles Ansell, Jr., gives the following figures:

OUT OF 100,000 BORN ALIVE THERE WILL BE LIVING	End First Year.	Age of 15.	Age of 60.
Peerage families.....	93,038	85,890	51,166
"Upper class experience".....	91,955	83,302	53,398
"Clergy children".....	91,667	79,536
"English life tables".....	85,951	68,456	36,983
"Carlisle table".....	84,610	63,000	36,430

"That is, out of 100,000 children born in the upper classes, nearly 10,000 more will reach the age of 15 than in the population at large. The influences which induce a higher rate of mortality among the lower classes are given by Ansell as follows:

"PHYSICAL.—(1) Food insufficient in quantity and improper as to kind; (2) deficiency of warm clothing; (3) want or delay of medical attendance in illness; (4) crowded and unhealthy dwellings; (5) neglect on the part of parents (especially when the mother is at work).

"MORAL.—(1) Illegitimacy; (2) children being a burden upon or considered as such by their parents; (3) parents having a direct pecuniary interest in the death of their children."

Dr. Grimshaw, Registrar-General of Ireland, gives the experience as to class mortality in Dublin for the four years 1883 to 1886, and says:

"Referring to children under five years of age, the rates per 1000 are found to be in the professional class, 20.52; middle, 58.25; artisan class, 69.05; general ser-

vise and pauper class, 108.73. The death-rates are such as to give a specially high percentage of persons under 15 in the second and third classes. The death-rate of children under five years of age is so excessive in Class IV. that the percentage of persons under 15 is there not up to the average."

Commenting on this, Professor Warner says:

"Now let us notice how heavy a burden the condition of things here indicated imposes upon Classes III., IV., and V., as compared with Classes I. and II. Pressure is brought to bear upon the poor, and especially upon Class III., in a fourfold way. First, the number under 15 years of age, and therefore of non-producers, is relatively high; second, the expense of a disproportionately large number of deaths is imposed upon the poor; third, the amount of sickness is disproportionately large; and, fourth, the number of births is larger than in the upper classes. Let us see what effects these influences will have upon a population of 1000 in each class:

Class Mortality.

BURDENS AND BURDEN-BEARING POWER OF 1,000 PERSONS IN VARIOUS CLASSES, POPULATION OF DUBLIN.

CLASS.	No. of Persons under 15.	Persons over 15.	Deaths.	Years of Sickness.	Years of Health for Persons over 15.	Ratio of Sickness to Effective Health.
I.....	229	771	15.20	30.40	746.5	1 : 24.5
II.....	300	700	26.21	52.42	663.3	1 : 12.6
III.....	322	678	23.00	46.00	645.6	1 : 14
IV. and V.....	277	723	37.79	75.58	665.5	1 : 08.8

"By 'effective health,' as used in the table, is meant the health of persons 15 years of age or over—that is, of persons capable of doing something for their own support, and possibly for the care of relatives. It will seem from the table regarding burdens and burden-bearing power, that in Class I. there will be one year of sickness to 24.5 of effective health; in Class II, one to 12.6; in Class III. one to 14; and in Classes IV. and V. one to 8.8. Thus we have some explanation of how the high death-rate among the unfortunate classes operates to impose burdens that crush them.

"There are too many assumptions involved in the derivative tables given to make it possible to consider the results reached entirely accurate, but in their general outline the figures doubtless reflect the actual situation."

Thus far we have been noticing statistics and facts almost exclusively. Concerning their interpretation caution must be exercised. Says Prof. Mayo-Smith (*Statistics and Sociology*, p. 149):

"The ordinary basis for comparison of mortality is to take the number of deaths per 1000 of the population. As the death-rate, however, is greater among males than among females, and at certain age periods than at others, it is obvious that comparison would only be fair between two populations where the sex and age distribution was exactly the same. This never happens, and even in the same population, in course of time, the sex and age distribution may vary. The use of the crude death-rate has given rise, therefore, to many criticisms. In 1881 the general rate in England and Wales was 18.9 per 1000 of all ages, while in France it was 22.0—i.e., 3.1 higher. But had the age distribution of the French population been identical with that of England, the general death-rate would have been 20.9 and not 22.0. Thus, of the 3.1 difference between the two rates, 2.0 was due to difference of health condition and 1.1 to difference of age distribution."

Various plans have been, therefore, proposed for correcting the death-rate by reducing the population to a common standard.

Professor Edgeworth, of Oxford, in Palgrave's *Dictionary of Political Economy*, thus sums up the generally received conclusions as to death-rates:

One cause of variations in death-rate—namely, "difference of age, may be placed in a category of causes which are of practical importance, largely on the ground that it is necessary to allow for their action in order to estimate the effect of another class of causes which it is more within the scope of human art to alleviate. This distinction is nearly identical with Dr. Farr's of 'causes inherent in the population, and causes outside the population' (*Vital Statistics*, p. 159 *et seq.*). Another cause belonging to the first category is sex. The full effect of this cause may be seen on inspection of a life-table. At the early ages the difference between the mortality of the two sexes is marked. At the zero point of age it appears that the proportion of male to female still-born children is 139:100. For the period 0-5 the proportion of mortality is 72 : 62 (according to Dr. Farr's life-table for England and Wales). At the age of adolescence female mortality gains upon male, but again lags behind at later ages. The disturbing effect which this cause exercises on inferences drawn from the general death-rate is not so considerable as the effect of age. Mr. Humphreys, in his paper *On the Value of Death-Rates* (*Journal of Stat. Soc.*, xxxvii., p. 444), contrasting the English towns which have the greatest and the least proportion of male to female inhabitants, argues that the extreme perturbation of the general death-rates which may be expected from this cause is not more than two per mille.

"Here may be mentioned the effect on mortality of the variations of the seasons. Of the four quarters of the year, the first is the most fatal; next comes the fourth; the mortality of the second quarter is for this country on an average in excess, but occasionally below, that of the third quarter (*Reports of the Registrar-General*, tables showing death-rates in each quarter of the years since 1838). A very elegant graphical representation of such vicissitudes is given by M. Levasseur (after M. Janssens) for Belgian infants, in the *Jubilee Volume of the Statistical Society*, 1885, p. 232. Quetelet's investigations of seasonable mortality in Belgium are particularly instructive (*Physique Sociale*, liv. ii., ch. v., §8). He shows that the curve of death-rate at different seasons varies for different ages, and that very generally it presents two maxima, one in winter, the other in summer. Besides the obvious importance attaching to such observations, they are valuable as enabling us to avoid perplexity in investigating other causes. The Registrar-General, in the investigation which will be presently noticed

concerning the death-rate in different occupations, has very properly selected the samples (of deaths) on which his conclusion is based from all seasons indifferently (*Supplement to the Forty-fifth Report of the Registrar-General*, p. 29). A sophist by taking the samples for one occupation from a healthy season, and for another occupation from an unhealthy season, might have brought out almost any conclusion which he wanted.

Season.

“Other causes, not admitting of such exact measurement, are race and climate (including properties of soil, water, etc.).

“Also it may be expected that the mortality of unmarried persons will, *ceteris paribus*, be particularly large. The married have the advantage at almost all ages, as is shown by Dr. Farr (*Vital Statistics*, p. 441, and references there given). But it is a nice question whether celibacy can be regarded as a cause of high death-rate. The high death-rate attending celibacy may be a case of *post hoc not propter hoc*; the finest individuals being selected for marriage; while ‘men with a weak constitution, ill health, or any great infirmity of body or mind will not often wish to marry, or will be rejected’ (Darwin, *Descent of Man*, part i., ch. v.).

“(β) The causes which have been mentioned require to be taken account of by those who would avoid perplexity in investigating another set of causes which are perhaps of more direct practical interest, as being capable of remedy by human effort. This second category of causes may be divided under four heads: (1) vice, (2) unhealthy occupations, (3) indigence, and (4) insanitary residences—agencies which are apt to be entangled with each other as well as with the first set of causes.

“(γ) There is much truth as well as exaggeration in Stämmilch’s dictum ascribing the chief differences in mortality to ‘the manner of life, the moral circumstances, virtue and vice, indolence and industry.’ One example is the great mortality of illegitimate children. Dr. Farr cites instances in which the death-rate of illegitimate infants is double that of the legitimate (*Vital Statistics*, p. 198). A similar excess of mortality among illegitimate children is shown by Quetelet (*Physique Sociale*, book ii., ch. vii., §2), Wappaeus (*Bevölkerungs Statistik*, part i., p. 214), and other continental statisticians. The vice of drunkenness is also conspicuously fatal. On this subject some of the most recent observations, together with a reference to the best authorities, will be found in the *Report on the Connection of Disease with Habits of Intemperance* by the collective investigation of the British Medical Association, edited by Isambard Owen. Among the earlier authorities may be mentioned Neison, who in his *Contributions to Vital Statistics* fully proves the connection between deep drinking and high death-rate; bringing out the remarkable fact that spirits are more fatal than malt liquors (*Contributions to Vital Statistics*, p. 218). Another authority particularly free from suspicion is the Registrar-General, whose statistics with respect to occupations (*Supplements to Reports for 1895, 1875, and 1835*) point unmistakably to a connection between drink and death. The mortality of hotel-keepers and their servants is appalling—about three times as great as that of the most healthy classes. Among the diseases to which the classes mentioned and several others succumb, ‘alcoholism’ plays a large part (*Supplement to Report for 1835*, p. xxx. *et seq.*).

Intemperance.

“At this point, however, the action of the cause which has been considered is intermixed with that which we have distinguished as cause (2), unhealthy occupations. It is difficult to pronounce with respect to the mortality in some occupations how much thereof is occasioned by irresistible temptation to drink, how much is due to other circumstances. Thus in the case of drivers (*Cab, Omnibus, Service, loc. cit.*), the bill of mortality due to ‘alcoholism’ is particularly large; but the same class also succumb in numbers to phthisis and diseases of the respiratory system, which may no doubt be connected with the exposure incident to the occupations in question.

“(2) The observations referred to prove the influence of occupation on health in many cases to be real and considerable. The number of deaths observed in 1881-82—more than 400,000; the scrupulousity above noticed with which these samples have been selected impartially from healthy and unhealthy seasons; the allowance for the effect of age (expressed in the last column of Table J, *Supplement to the Forty-fifth Report*, 1885, p. xxvi.), are very convincing. The suspicion of accident is precluded by the general agreement between

the statistics for 1861-62, 1871, and 1880-82. The same occupations constantly come out low or high in the scale of mortality. At one end of the scale are clergymen with a coefficient of death-rate or ‘comparative mortality figure’ 556; gardeners and farmers with coefficients respectively 599 and 681, with at the other end of the scale hotel-keepers and their servants, for whom the corresponding figures are respectively 1521 and 2205, also chimney-sweepers, workers in earthenware (1742), and the residual class of general laborer (2020). (See J. T. Arlidge, M.D., *The Hygiene, Diseases, and Mortality of Occupations*, 1892.)

“(3) In the last case, and probably some others, a further cause—indigence—comes into play. The term indigence must be construed strictly as want of necessaries, ‘inadequate warmth and food’ (Farr). Mere absence of riches is not fatal to life, as Neison’s statistics with respect to members of friendly societies show (*Contributions to Vital Statistics*; cf. Wappaeus, *Bevölkerungs Statistik*, part i., p. 201). The very different consequences of actual indigence may be traced in certain statistics of class mortality among the population of Dublin compiled by Dr. Grimshaw, and discussed by Mr. Humphreys in a paper already referred to (*Journal of the Statistical Society*, 1887, vol. 50). In the same paper reference is made to the observations made by Mr. Ansell and Hodgson and others, proving that the more favored classes enjoy greater vitality. Especially with respect to infant mortality is the poverty of the poor his curse. The death-rate for infants under five, in the ‘general service’ class of the Dublin population, was 110 per mille; in the ‘professional’ class, 22 per mille (*ibid.*, p. 282). So the mortality of peers’ and clergymen’s children is three times less than the mortality of infants of the same age in large towns (Farr, *Vital Statistics*, p. 159). These conclusions are confirmed by numerous observations on the comparative death-rate in the poorer and more flourishing parts of towns; some of which are cited by Wappaeus (*Bevölkerungs Statistik*, part i., p. 200).

Economic Causes.

“(4) Here, and indeed generally, mere indigence, the want of necessaries, is aggravated by a fourth cause, insanitary conditions of residence, or, in Dr. Farr’s more exact language, ‘exposure to poisonous effluvia and destructive agencies.’ The interaction of these two causes is strikingly exhibited in a recent article in the *Giornale degli Economisti*, ‘Nuova Politica Sanitaria, in Italia’ (March, 1891); where it is contended that the sanitary measures carried out in Italy defeated their own end. For the taxpayer, deprived by the burden of taxation of the necessaries of life, becomes thereby more exposed to the shafts of disease. In our terminology cause (4) might be reduced, and yet the effect would be more fatal if concurrently cause (3) were aggravated.

“The nature and variety of insanitary conditions are ably discussed by Dr. Farr (*Vital Statistics*). A vast mass of experience as to the evil effect of crowding is summed up by him in the simple formula that the mortality of districts is as the twelfth root of their densities (*Vital Statistics*, p. 175). In symbols

$$m = \left(\frac{D}{12}\right)^{.12}$$

The fact that in an earlier paper the *sixth* root was proposed, and that in the formula the index .12 does not signify the twelfth, but rather the eighth or ninth root, is not suggestive of extreme precision. At any rate, the law makes no claim to be more than empirical. It is not fulfilled by the experience of the crowded Peabody Buildings, where the mortality is less than for London generally (Newholme, *Journal of the Statistical Society*, 1891). It is interesting to inquire whether the causes of death which admit of reduction are being reduced by science, or:

“III. More generally, and without reference to causation, whether a decline of death-rate attends the progress of civilization. The most extended series of observations is that which the Swedish census presents (quoted in the twenty-fifth volume of the *Journal of the Statistical Society*, and by Wappaeus, *op. cit.*, p. 220). Looking at these we may now say with even more truth than Malthus said: ‘The gradual diminution of mortality since the middle of last century is very striking.’ According to Dr. Farr, ‘the mortality of the city of London was at the rate of 80 per 1000 in the latter half of the seventeenth century, 50 in the eighteenth, against 24 in the present day’ (*Vital Statistics*, p. 137).

“On the other hand, the returns for France and Russia, extending over a long period of years, which Wappaeus adduces (*loc. cit.*), do not show a marked decline. And it is remarkable that the death-rate for

England and Wales has remained virtually unaltered for the greater part of the time over which the record extends, from 1841 to 1871. Since that period, indeed, a decline has set in, ascribed by some to improved sanitation."

DEBS, EUGENE V., was born in Terre Haute, Ind., in 1855, the son of a respected grocer, originally an Alsatian. Educated in the public schools, including the high school, and later attending a commercial college in the evenings, he, in 1870, commenced working in the Vandalia paint shop in Terre Haute, but in 1871 got a position as fireman on a Vandalia locomotive. In 1874 he got a better place in a wholesale grocery, and retained this five years, till he was triumphantly elected city clerk on the Democratic ticket, and re-elected in 1881. His future, however, was to lie in railway labor organizations. As a member of the Brotherhood of Locomotive Firemen, he was early elected to office, and for twelve years served that organization as grand secretary and treasurer, editing also the *Locomotive Firemen's Magazine*; but he believed that all railway employees should be united in one organization, and so, June 20, 1893, he established, with the aid of others, the American Railway Union. (For an account of this, see RAILWAY EMPLOYEES' ORGANIZATIONS.) As its president, Mr. Debs made the American Railway Union one of the strongest labor unions of the country, and was successful in a strike on the "Great Northern." May 11, 1894, the operatives at Pullmanville struck, and after futile efforts to gain a settlement by arbitration, they joined the American Railway Union, and this organization took up their cause. In June Mr. Debs ordered a boycott of Pullman cars. (For the details of this strike, see PULLMAN STRIKE.) The strike gradually spread. On July 2 Judges Wood and Grosscup, at Chicago, ordered a sweeping "omnibus" injunction. On the basis of telegrams and advice sent by Debs after this, he and his colleagues were arrested on two indictments for contempt of court, and were tried in September in the Federal Circuit Court sitting at Chicago. Judge Wood did not render a verdict till December, but then condemned Mr. Debs to six months' imprisonment, and his companions to three. Appeal was taken to the Supreme Court for release on *habeas corpus*, the ground being that an equity court had no right to issue such an injunction, and thus deprive men of trial by jury. The Supreme Court, however, sustained the Circuit Court, and Mr. Debs and his companions suffered imprisonment in Woodstock Jail, beginning in May, 1895. Mr. Debs was liberated in November, and was given an ovation in Chicago. He is to-day one of the ablest and most popular labor leaders in America, and constantly in demand as a speaker in the movement. He desires to further labor organization till labor men can all unite in one great strike for their rights at the polls. His imprisonment without jury trial many believe to be one of the most dangerous breaches of

constitutional liberty yet perpetrated. (See PULLMAN STRIKE.)

DEBT.—For a discussion of debt in its economic relations, see CREDIT. We give here the main facts as to national, State, and municipal indebtedness, with particular reference to conditions in the United States. National debts of long duration are of comparatively modern date. Ancient governments usually met their ordinary expenses by extortionate taxation, by plunder, and by warfare on foreign cities and countries. Even Napoleon supported his armies when abroad largely in this way.

The first permanent national debt was created by the papal government. Only a small portion of the money raised for the Pope was put into his treasury. All the nations of Europe were obedient to Pius II., yet he was so greatly in need of money that he is said to have been able to afford only one meal a day for a considerable time, and was obliged to borrow 200,000 ducats to prepare for the war with Turkey which he meditated. Another mode of raising money was to create and sell offices. A certain sum was immediately paid for the office, and the official received at stated times thereafter a fixed sum or interest during his life. These arrangements were essentially annuities. The interest was raised by increasing the imposts of the Church.

Sixtus IV., under the guidance of his prothonotary Sinolfo, established whole colleges by a single act, and sold the places for 200 or 300 ducats each. Leo X. carried this system farther still, encouraged in it by the prosperity which for a time at least came to Rome because of the large sums of money which poured into the city. Under Clement VII. a new system became necessary. Hitherto the money raised had been returned in the way of interest, the interest ceasing at the lender's death. The first real national loan was one received by Clement, amounting to 200,000 scudi. Clement agreed to pay 10 per cent. to the lender, and to continue payment to his heirs. The interest was charged to the custom-house revenues, and the lender had his claims secured by giving him a share in the management of the custom-house. No capitalist would lend his money except where he was given a certain amount of control in the government affairs. In modern days lenders are not allowed, directly at least, to have a share in governmental management; but they still are pledged certain revenues in payment of the debt. Pitt, in England, and Alexander Hamilton, in America, have both strongly advised this latter course. Venice and Genoa were the next States to follow the lead of the Pope, and after them Florence, Spain, and Holland.

In England William III. was obliged, by the expensiveness of his wars, to borrow money and pledge the credit of the State. This was the first English loan of this kind. The item "Interest and Management of the Public Debt" appears in 1694 for the first time in English accounts. The first funded debt was \$6,000,000, borrowed at this date from the Bank of England. The term "fund" meant then the special tax which was set apart for interest on the money borrowed; whereas now the word is understood to

mean the money itself. After this another loan of \$10,000,000 soon followed, and Charles II. had his private debts added to the national debt.

The national debt of France began in 1375; but in 1597 Sully, the chief minister of Henry IV., reformed the financial system and paid the public debt, which amounted to 332,000,000 livres. Besides this he remitted 20,000,000 of taxes and collected a surplus of 17,000,000 livres,

which succeeding French kings soon wasted. During this early period the Low Countries were most heavily freighted with debt. At Amsterdam it was a common saying that every dish of fish was paid for once to the fisherman and six times to the money-lender. The following table, compiled from the Eleventh United States Census Reports (*Bulletin* 64), gives the national indebtedness of the world in 1890:

* In these amounts there is included debt of Hungary for 1880, \$536,051,184; for 1890, \$837,928,836. Florin reckoned at 50 cents.

† Inclusive of floating debt, but exclusive of annuities whose capitalized value is estimated by good authority to be not less than \$2,000,000,000.

‡ The rupee is reckoned at 50 cents. Its exchange value in 1890 was about 35 cents, making the actual face value of the debt about 30 per cent. less than the amount stated.

§ Reckoning the population of European and Asiatic Turkey and Tripoli in Africa.

The following table gives the outline of the history of Great Britain's national debt:

	Principal.	Annual Charge.
Debt at the Revolution in 1688..	£664,263	£39,835
Debt at Accession of Queen Anne, 1702.....	16,394,702	1,310,852
Debt at Accession of George I., 1714.....	54,145,363	3,351,268
Debt at Accession of George II., 1727.....	52,092,238	2,217,461
Debt in 1762 (George III., 1760).....	138,865,430	4,851,961
Debt at beginning of American War.....	128,583,635	4,471,481
Debt at conclusion of American War, 1784.....	249,851,628	9,559,817
Debt at Accession of George IV., 1820.....	794,980,481	29,789,658
Debt at Accession of Queen Victoria, 1837.....	761,422,570	28,533,192
Debt March 31, 1893.....	671,042,842	*25,200'000

An exceedingly large proportion of national debts have been caused by wars. The four debts of the United States were incurred by war

expenditure, as were also the debts of England, France, the Netherlands, Russia, Austria, and Italy. Italy, France, and Germany, and especially the latter, contracted part of their debt by building railroads and canals.

But with many nations, and especially the weaker ones, loans are usually negotiated abroad. This has led many of them to repudiate their debts. France, perhaps, did this first, but other nations have followed her example. Spain has repeatedly compounded with her creditors; and Portugal, Greece, and the South American States have repudiated their debts. These dishonest nations have been enabled to continue their borrowing only through the aid of cunning bankers, who on receipt of large bribes have undertaken to negotiate loans. Tables have been constructed and arguments put forward in defense of the policy of a gradual payment of national debts; but there is a great deal of sophistry in these calculations.

Undoubtedly the great reasons why debt-paying is so unpopular are that in weak countries it requires too much taxation, and in wealthy countries whose credit is good, bankers like to continue the loan as a favorable investment for

* This is now a fixed charge.—Whitaker.

themselves. This is particularly the case in Great Britain and the United States. It is claimed by some radicals that "the money power" even invents war scares and secures legislation to lower the receipts of the Government in order to make an excuse for fresh loans. (See CURRENCY.)

NATIONAL DEBT OF THE UNITED STATES.

The debt of the United States, as reported to the first Congress at its second session, 1790-91, by Alexander Hamilton, Secretary of the Treasury, consisted of the foreign debt, domestic

debt, and State debts. The secretary recommended that these latter be assumed by the general Government; and after considerable discussion this was agreed to. The debt then stood :

Domestic debt.....	\$42,414,085
Foreign debt	11,710,378
State debts (as finally assumed).....	18,271,786
Total.....	\$72,396,249

The foreign debt consisted of money due in France, Holland, and Spain for loans made to us during the Revolution. Since 1791 the debt has varied as follows :

Statement of outstanding Principal of the Public Debt of the United States on January 1 of each Year from 1791 to 1842, inclusive; on July 1 of each Year from 1843 to 1886, inclusive; on December 1 of each Year from 1887 to 1892, inclusive, and on November 1, 1893, 1894, and 1895.

1791 Jan. 1	\$75,463,476.52	1826 Jan. 1.....	\$81,054,059.99	1861 July 1.....	\$90,580,873.72

It will be seen that the debt was considerably reduced by the year 1812; the increase between 1812 and 1816 was due to the War of 1812; in 1836 the treasury had on hand a surplus of over \$40,000,000, all but \$5,000,000 of which was ordered by Congress to be distributed among the States, on certain conditions and in four instalments. Three of these were paid, but not the fourth. The increase between 1847 and 1849 was due to the Mexican War. After the panic of 1857 the debt began to increase. The sudden increase in 1862 was caused by the Civil War. During that struggle in 1866 the debt reached the highest point in the history of the country. (See FINANCE.) The total amount of loans issued by the Government up to the outbreak of the Civil War was \$505,353,591.95; between that time and July 1, 1880, there was issued \$10,144,589,408.69; and later 3 1/2 per cent. bonds to the amount of \$460,461,050, matured 5 and 6 per cent. bonds extended being at that rate, and 3 per cent. bonds to the amount

of \$304,204,350, for the purpose of extending the above-mentioned 3 1/2 per cent. bonds.

At its highest point (1866) the debt of the United States exceeded \$2,700,000,000. This was composed of a great variety of different obligations, some bearing as high as 7 1/8 per cent. interest. Of this debt, \$830,000,000, bearing interest at 7 1/8 per cent., matured in 1867 and 1868, and about \$300,000,000 other debt matured in the same period. To meet this there were issued in 1865, \$332,998,950, 15 years, 6 per cent. bonds; in 1867, \$379,616,050, 15 years, 6 per cent. bonds; in 1868, \$42,539,350, 15 years, 6 per cent. bonds; in 1867 and 1868, \$85,150,000 demands, 3 per cent. certificates. The refunding act of 1870 authorized the issue of not more than \$200,000,000, 10 years, 5 per cent. bonds; of not more than \$300,000,000, 15 years, 4 1/2 per cent. bonds; of not more than \$1,000,000,000, 30 years, 4 per cent. bonds. In 1871 this was amended, increasing the amount of 5 per cent. bonds to \$500,000,000, the total issue, however,

not to be increased thereby. Under this act there were issued a total of \$412,806,450 of 5 per cent. bonds, and after 1876, \$250,000,000 4½ per cent. bonds. In 1879 a bill was passed authorizing the issue of \$10 certificates, bearing 4 per cent. interest and exchangeable into the 4 per cent. bonds of the acts of 1870 and 1871. The net result of all these changes was that the national debt, considerably more than one half of which was in 1865 outstanding at 6 per cent. and over, was in 1879 costing but 4 and 4½ per cent. for more than one half of its then principal. In 1881 over \$670,000,000 of the public debt running at 5 and 6 per cent. matured. Congress failed to provide the means for meeting it, and there was at the disposal of the secretary for this purpose only the surplus revenue and somewhat over \$100,000,000 of 4 per cent. bonds under the acts of 1870 and 1871. Under these

circumstances the secretary (Windom) made a general offer to the holders of these bonds to extend the bonds of such as might desire it at 3½ per cent., redeemable at the pleasure of the Government. This measure was a complete success, over \$460,000,000 bonds being extended at 3½ per cent. The next Congress (in 1882) authorized 3 per cent. bonds, redeemable at the pleasure of the Government, to be issued instead of the bonds extended at 3½ per cent., and more than \$300,000,000 were so issued. Meanwhile, the reduction of the debt proceeded so rapidly that the last of the 3½ per cents. were called for payment November 1, 1883, and the last of the 3 per cents. July 1, 1887, leaving outstanding only the 4½ and 4 per cent. bonds. (For further information regarding the debt and recent loans, see CURRENCY.)

OFFICIAL STATEMENT OF NOVEMBER 1, 1895.

INTEREST-BEARING DEBT.		CLASSIFICATION OF DEBT NOVEMBER 1, 1895.	
Funded loan of 1891.....	\$25,364,500.00	Interest-bearing debt.....	\$747,361,560.00
Funded loan of 1907.....	559,630,700.00	Debt on which interest has ceased since maturity.....	1,681,670.26
Refunding certificates.....	50,960.00	Debt bearing no interest.....	377,335,876.64
Loan of 1904.....	100,000,000.00		
Loan of 1925.....	62,315,400.00	Aggregate of interest and non-interest bearing debt.....	\$1,126,379,106.90
Aggregate of interest-bearing debt, exclusive of United States bonds issued to Pacific railroads, as stated below....	\$747,361,560.00	Certificates and Treasury notes offset by an equal amount of cash in the Treasury.....	591,102,673.00
		Aggregate of debt, including certificates and Treasury notes.....	\$1,717,481,779.90
DEBT ON WHICH INTEREST HAS CEASED SINCE MATURITY.		CASH IN THE TREASURY.	
Aggregate debt on which interest has ceased since maturity.....	\$1,681,670.26	Gold certificates.....	\$50,585,889.00
DEBT BEARING NO INTEREST.		Silver certificates.....	342,409,504.00
United States notes.....	\$346,681,016.00	Certificates of deposit, act June 8, 1872.....	57,015,000.00
Old demand notes.....	54,847.50	Treasury notes of 1890.....	141,092,280.00
National bank notes:			\$591,102,673.00
Redemption account.....	23,706,619.00	Fund for redemption of uncurrent National bank notes.....	\$8,250,722.82
Fractional currency:		Outstanding checks and drafts.....	2,323,028.84
Less \$8,375,934 estimated as lost or destroyed, act of June 21, 1879.....	6,893,394.14	Disbursing officers' balances.....	26,690,586.34
Aggregate of debt bearing no interest..	\$377,335,876.64	Agency accounts, etc.....	3,822,601.39
CERTIFICATES AND NOTES ISSUED ON DEPOSITS OF COIN AND LEGAL-TENDER NOTES AND PURCHASES OF SILVER BULLION.			41,086,939.39

Certificates of deposit.....	57,015,000.00		179,947,998.48
Treasury notes of 1890.....	141,092,280.00	Aggregate.....	\$812,137,610.87
Aggregate of certificates and Treasury notes, offset by cash in the Treasury...	\$591,102,673.00	Cash balance in the Treasury, October 31, 1895.....	\$179,947,998.93

STATE, COUNTY, AND MUNICIPAL DEBTS.

The origin of State debts in the United States dates from the Revolutionary War. The different States contracted debts for war purposes, very various in amount, but all to a considerable degree; and the Congress of the Confederation promised to meet every claim with justice. After the war, it was disputed as to whether the Government should assume the debt of any State. It was urged that as the Government had taken over the customs duties, which previously had belonged to the States, it should with this chief source of revenue take over also the debts of the States. But the motion to assume was carried by only two votes; and while \$21,-

500,000 was assumed, a balance of \$4,000,000 was left unprovided for. In spite of this compromise, the States continued their borrowing careers until \$170,000,000 were scored against them in 20 years. This money was declared to have been spent as follows: 31 per cent., or \$52,640,000, were expended in aiding State banks; \$60,201,551 were expended for canals; nearly 25 per cent., or \$42,871,084, were furnished to railroads, and \$6,618,958 for turnpikes and macadamized roads, and the balance was expended for several objects. Over \$100,000,000, therefore, were spent for internal improvements.

The greater amount of this money had been borrowed from British creditors. Before very

long the States became uneasy under their burden, and at last turned to the Federal Government for relief.

In 1836 there was, as we have seen, a surplus of over \$40,000,000 in the Federal treasury, and \$37,468,859 of this Congress voted to divide among the States in proportion to their population, provided that the States would agree to accept it, but authorize their treasurers to return it on demand. It was to be paid in four payments during 1837, three only of which were actually made, the fourth being prevented by the panic of 1837. For several years there was an annual deficit, and the States could get nothing. They were in great distress. In 1842 they owed \$198,818,736. A plan was presented for assumption of the State debts by the Government. This plan is said to have emanated from the other side of the Atlantic. Benton says that "these British capitalists, connected with capitalists in the United States, possessed a weight on this point which was felt in the halls of Congress. The disguised attempts at this assumption were in the various modes of conveying Federal money to the States in the shape of distributing surplus revenue, of dividing the public land money, and of bestowing money on the States under the fallacious title of a deposit. But a more direct provision in their behalf was wanted by these capitalists, and in the course of the year 1839 a movement to that effect was openly made through the columns of their regular organ, *The London Banker's Circular*, emanating from the most respectable and opulent house of the Messrs. Baring Brothers & Co."

The British capitalists were willing to reduce the interest one half if the Government would assume the obligation. It was not done, however, and the indebtedness increased. The indebtedness of the Southern section was increased far more after the war. Under the guise of being needed for internal improvements, many loans were negotiated under suspicious circumstances. In 1870 and in 1880 the debts of the States stood thus :

	1870.	1880.
New England States	\$50,348,550	\$49,969,514
Middle States	79,834,481	45,672,575
Southern States	174,486,452	113,967,243
Western States	44,018,911	36,565,360
Pacific States	4,178,504	4,547,389
Total	\$352,866,898	\$250,722,081

The reductions shown for 1880 were made by the Middle and Western States by actual payments ; but this was not the case with the Southern States. Their \$60,000,000 of reduction were effected by the much easier mode of repudiation.

It is claimed, however, that the "carpet-bag" debts of the Southern States, under which some of them are still suffering, were created during the reconstruction period, when the South was at the mercy of adventurers from the North and the ranks of the negro population supported and protected by the Federal Government. These burdens aggregated in 1871 some \$201,626,015, distributed among the reconstructed States as follows: Alabama, \$52,761,017; Arkansas, \$19,338,000; Florida, \$15,797,587; Georgia, \$42,569,500; Louisiana, \$40,021,734; North Carolina, \$34,887,464; South Carolina,

\$22,180,316; Texas, \$14,930,000; Virginia, \$47,090,866. It is claimed also that the debts of the Southern States contracted from 1861 to 1865 were repudiated by order of the Federal Government, so that the indebtedness was due almost wholly to "carpet-bag" financing.

The diminution in the total indebtedness of 1880, which stood at the sum of \$250,722,081, and is the indebtedness of 38 States, is partly due to this repudiation. Recent years, however, have seen a very large and dangerous increase of municipal debts. Mr. Bryce, in his *The American Commonwealth* (1st edition, vol. 1, chap. 43), gives the following account of the growth of these debts: "Municipal indebtedness has advanced, especially in the larger cities, at a dangerously swift rate. Of the State and county debt much the largest part had been incurred for, or in connection with, so-called 'internal improvements'; but of the city debt, tho a part was due to the bounties given to volunteers in the Civil War, much must be set down to extremely lax and wasteful administration, and much more to mere stealing, practised by methods to be hereafter explained, but facilitated by the habit of subsidizing, or taking shares in, corporate enterprises which had excited the hopes of the citizens.

Municipal Debt.

"The disease spread till it terrified the patient, and a remedy was found in the insertion in the constitutions of the States of provisions limiting the borrowing powers of State legislatures. Fortunately the evil had been perceived in time to enable the newest States (Minnesota, Wisconsin, Oregon, Kansas, Nevada, Nebraska, West Virginia, Colorado) to profit by the experience of their predecessors. For the last 30 years, whenever a State has enacted a constitution, it has inserted sections restricting the borrowing powers of States and local bodies, and often also providing for the discharge of existing liabilities. Not only is the passing of bills for raising a State loan surrounded with special safeguards, such as the requirement of a two-thirds majority in each house of the legislature; not only is there a prohibition ever to borrow money for, or even to undertake, internal improvements (a fertile source of jobbery and waste, as the experience of Congress shows); not only is there almost invariably a provision that whenever a debt is contracted the same act shall create a sinking fund for paying it off within a few years, but in most constitutions the total amount of the debt is limited, and limited to a sum beautifully small in proportion to the population and resources of the State. Thus Wisconsin fixes its maximum at \$200,000 (\$40,000); Minnesota and Iowa at \$250,000; Ohio at \$750,000; Nebraska at \$100,000; prudent Oregon at \$50,000; and the great and wealthy State of Pennsylvania, with a population now exceeding 5,000,000 (Constitution of 1873, Art. ix. § 4), at \$1,000,000. New York (Constitution of 1846, Art. vii. §§ 10-12) also names a million of dollars as the maximum, but permits laws to be passed raising loans for 'some single work or object,' provided that a tax is at the same time enacted sufficient to pay off this debt in 18 years; and that any such law has been directly submitted to the people and approved by them at an election.

"In 31 States, including all those with recent constitutions, the legislature is forbidden to 'give or lend the credit of the State in aid of any person, association, or corporation, whether municipal or other, or to pledge the credit of the State in any manner whatsoever for the payment of the liabilities present or prospective of any individual association, municipal, or other corporation' (Constitution of Missouri of 1875, Art. iv. § 45, a constitution whose provisions on financial matters and restrictions on the legislature are copious and instructive. Similar words occur in nearly all Western and Southern, as well as in some of the more recent Eastern constitutions), as also to take stock in a corporation, or otherwise embark in any gainful enterprise. Many constitutions also forbid the assumption by the State of the debts of any individual or municipal corporation.

"The care of the people for their financial freedom and safety extends even to local bodies. Many of the recent constitutions limit, or direct the legislature to limit, the borrowing powers of counties, cities, or towns, sometimes even of incorporated school districts, to a sum not exceeding a certain percentage on the assessed value of the taxable property within the area in question. This percentage is usually 5 per cent. (e.g., Illinois, Constitution of 1870, Art. ix. § 12), sometimes (e.g., Pennsylvania, Constitution of 1838, Art. ix. § 8) 7 per cent.; New York (amendment of 1883), 10 per cent. Sometimes also the amount of the tax leviable by a local authority in any year is restricted to a definite sum—for instance, to ¼ per cent. on the valuation.

(See, for elaborate provisions under this head, the Constitution of Missouri of 1875.) And in all the States but seven, cities, counties, or other local incorporated authorities are forbidden to pledge their credit for, or undertake the liabilities of or take stock in, or otherwise give aid to, any undertaking or company. Sometimes this prohibition is absolute, sometimes it is made subject to certain conditions, and may be avoided by their observance. For instance, there are States in which the people of a city can, by special vote, carried by a two-thirds majority, or a three-fifths majority, or (in Colorado) by a bare majority of the taxpayers, authorize the contracting of a debt which the municipality could not incur by its ordinary organs of government. Sometimes there is a direction that any municipality creating a debt must at the same time provide for its extinction by a sinking fund. Sometimes the restrictions imposed apply only to a particular class of

undertakings—e.g., banks or railroads. The difference between State and State are endless; but every where the tendency is to make the protection against local indebtedness and municipal extravagance more and more strict, nor will any one who knows these local authorities, and the temptations, both good and bad, to which they are exposed, complain of the strictness. "Cases, of course, occur in which a restriction on the taxing power or borrowing power of a municipality is found inconvenient, because costly public improvement is rendered more costly if it has to be done piecemeal."

The following statement of the indebtedness of the States and Territories in 1890 is compiled from the abstract of the Eleventh United States Census :

DEGENERATION.—To whatever school of social reform one belong, whatever be his view of the cause of present ills and the methods to be followed to remove those ills and to advance to any ideal condition, whatever that ideal may be, one cannot escape the question of the ability of the individuals who compose society to conduct the methods of reform believed in, and to realize the ideal conditions that may be desired. The socialist, who dwells most upon the power and function of society in developing progress, must meet the question whether the individual be capable of socialism no less than the individualist must consider individual ability. We therefore consider in this article the causes which tend to lower individual ability and to produce that personal degeneration which makes the individual lower than the norm (*de*, from, and *genus*, class or norm), unfitted to play his proper part in life. This is all that we mean here by the degenerate. All forms of unfittedness for life are more or less connected, and pass by degrees from the slightest unfittedness to the extremes of vice, intemperance, and disease.

The conception of degeneration which prevails to-day in the study of mental disease, and which lies at the basis of Max Nordau's well-known book, *Degeneration*, was first clearly defined by Dr. Morel in his *Traité des Dégénérescences physiques, intellectuelles et morales de l'Espèce humaine et des Causes qui produisant ces variétés maladières*, published in Paris in 1857. He says, p. 5: "The clearest notion we can form of degeneracy is to regard it as a morbid deviation from an original type. This deviation, even if at the outset it was ever so slight, contained transmissible elements of such a nature that any one bearing in him the germs becomes more and more incapable of fulfilling his functions in the world; and mental progress, already checked in his own person, finds itself menaced also in his descendants." Such degeneracy shows itself, according to many writers, and particularly Lombroso (*q. v.*), in his *L'Uomo delinquente*, in certain physical characteristics termed *stigmata*, such as deformities, stunted growth, asymmetry, etc. Max Nordau, however, argues that there are also certain mental stigmata which appear in degeneracy when coupled with affinity for art or literature. Such higher degenerates he considers to dwell in the borderline between reason and pronounced madness. These mental stigmata he considers to be the lack of moral sense or of moral proportion, egoism, impulsiveness, emotionalism, despondency, fear; a predilection for idle reverie, doubts and curious surmisings as to the causes of the universe, mysticism, etc. His book, which has been by many received as an able contribution to modern thought, and by others as a weak and sometimes ignorant criticism upon new forms of art and literature, is a minute analysis of many of the foremost works of art and literature of the day, with the result of convicting most of the artists and *littérateurs* of the day of being, according to Nordau, degenerate.

We have referred to this book to show how wide is the range that has been covered by the

word degenerate. The causes that produce such an undefined and such an undefinable phenomenon must be themselves undefined and undefinable. Only some of them can be here noted, and one must beware of too exact statements, especially as to the degree to which different causes contribute to producing character and ability below the norm. The main causes we can here only name, for a discussion of them referring the reader to their respective heads. In the first place, we are met by the old question how far environment and heredity contribute to the formation of character, and how far men form their own characters. Without entering into questions of philosophy, it is not difficult to show the results of modern careful investigation upon this point. In Mr. A. G. Warner's *American Charities*, p. 34, he has tabulated the results of careful investigations as to the prime causes of poverty, conducted by trained charity organization visitors in Baltimore, Boston, Buffalo, Cincinnati, and New York, by Mr. Charles Booth in London, and results tabulated by Böhmert for 76 German cities. This tabulates practically all the scientific investigations that have been made. We give the details of it in the article **POVERTY, CAUSES OF**. We here simply point out some of its results. According to this table, in all the different investigations taken by men and women, humanitarians, tho not socialistically inclined, only from 2.7 to 42.2 per cent. of the cases were found to be primarily due to causes indicating misconduct, while the causes indicating misfortune are put at from 46.4 to 92.5 per cent. According to this showing, then, poverty—and since poverty and degeneration usually are associated, degeneration—is very much more due to misfortune than misconduct. And even in cases of poverty due to misconduct, one can by no means be sure how much of the misconduct is due to bad environment or bad heredity. Misconduct causes much poverty—of that there is no question; but that poverty also causes much misconduct, such as drinking, prostitution, crime, theft, can no more be questioned. How much tendency, too, to drinking, prostitution, and crime is inherited, who can say? Cases like the Jukes (*q. v.*) show the terrible power of heredity. The extent to which people thus form their own characters, as taught by modern science, is reduced to the lowest proportions. That people can, however, rise out of the lowest environment to the highest character, numerous instances indicate; how far this, however, is due to heredity remains still to be ascertained.

Coming to the question as between heredity and environment, which is the more effective cause, we are again on a contested field in biological controversy.

Mr. Spencer's philosophy is mainly based on the belief that heredity accounts for much, and that acquired characteristics can be transmitted to posterity. Professor Weismann denies this. Science to-day is undecided upon the point, tending perhaps, however, to the position that while Weismann may not be wholly right, and acquired characteristics may sometimes be transmitted, yet for the future race selection has more to do

with character than environment, and acquired character cannot largely be transmitted. This,

**Heredity
or En-
vironment.**

however, does not prevent environment from being for the individual more important than heredity, which seems to-day largely proven. For further details upon this point, however, see HEREDITY.

Coming to the question of what are the principal factors in environment that produce degeneration in the individual, perhaps the first that should be named is lack of employment. This has the highest percentages of *any single cause* of poverty in Professor Warner's table, its percentages running from 2.2 per cent. to 32.5 per cent., while insufficient employment and poorly paid employment carry the percentage much higher. Not, perhaps, so much as a cause of poverty, since it is rather a result of poverty, but certainly as a cause of degeneration among the very foremost causes, is the lack of a good home. This is probably the supreme cause of degeneration as far as environment goes, mainly because it is the cause most affecting the early years, when, by all experience, character is the most impressionable. The point is too well known, however, to need dwelling upon here. For an alarming confirmation of it, see article CRIMINOLOGY, section "Causes of Crime." It should, perhaps, however, be suggested, too, that in noticing the terrible effects upon character of lack of homes and poor homes, one should not forget the terrible results upon character of unhappy homes, of unhappy marriages, and family quarrels. (See FAMILY.)

Professor Warner puts as a most palpable social cause of degeneration accidents, and shows how in one year, ending June 30, 1892, 28,268 men in railway employ were injured on the railways of the United States, or one man for every 29. (See RAILWAYS. For accidents in manufactories and trades to children, see CHILD LABOR.) It must not be forgotten that the worst results of accidents are often not the direct results, but the indirect, when homes are broken up through the inability of the breadwinner to maintain the family. Akin to this is the effect of unhealthy trades. (See DANGEROUS TRADES.) The effect of this, however, on the individual and the family can be only seen in studying the relative death-rates, and perhaps even more the relative sick-rates that prevail in different occupations. According to statistics prepared by Josef Köröski, as quoted by Professor Warner (*idem*, p. 104), if we start at the age of 25 with 1000 persons of each class, there will be alive at the end of 35 years, of merchants, 587; of tailors, 421; of shoemakers, 376; of servants, 290; of day laborers, only 253. The total number of years of life for the merchants will be 28,501, and of the laborers only 22,317, while, worse yet, of the years falling to the laborer, 1,493 will be years of sickness, while of the merchants' years only 824 will be years of sickness. Such are some of the social causes of degeneration.

Among the causes which may be considered under misconduct, the most recent thought gives a larger place to sensuality than to intemperance. It is often not easy to tabulate this as a cause; but, says Professor Warner: "Careful

observers believe it to be a more constant and fundamental cause of degeneration than intemperance. It certainly effects degeneration of a more or less pronounced type in a much larger number of persons in a much larger number of Sensuality. It persists almost to the end in the most degenerate stock, while at the same time it is operative among the healthier classes." It has, however, been comparatively little studied. The effects of venereal disease have been treated at length, but the amount of vitality burned out through lust has never been and, perhaps, never can be adequately measured. Above all, it brings multitudes of unhealthy children into the world, often to be neglected after birth. (See ILLEGITIMACY.)

Intemperance is much more readily recognized as a cause of degeneration. Says Professor Warner: "Probably nothing in the tables of the causes of poverty, as ascertained by cold counting, will more surprise the average reader than the fact that intemperance is held to be the chief cause in only from one fifteenth to one fifth of the cases, and that where an attempt is made to learn in how many cases it had a contributory influence, its presence cannot be traced at all in more than 28.1 per cent. of the cases. (See INTemperance.) Professor Warner sums up the case by saying: "The general conclusion regarding drink as a cause of poverty is sufficiently well formulated by Mr. Booth. 'Of drink in all its combinations, adding to every trouble, undermining every effort after good, destroying the home and cursing the young lives of the children, the stories tell enough. It does not stand in apparent chief cause in as many cases as sickness and old age; but if it were not for drink, sickness and old age could be better met.'" Such are the chief social causes of degeneration, but by no means all. Speculation in the market, hopelessness and discouragement in business—all are causes. Perhaps the most powerful causes of personal degeneration have not yet been mentioned—the psychological causes. These may be often connected with religion. When in early years moral teachings have been combined with certain religious dogma, it often happens that when in later years the religious dogmas are given up, there results, for a time at least, a moral chaos. Probably far more demoralizing both in extent and degree, and especially to the young, is the skepticism as to honor and virtue which results from seeing those whom they have been taught to respect at the church commit acts contrary to their profession. The degeneration of character that arises from this source can never be measured, but it must be among the most operative causes. Such considerations, however, lead us into fields too wide to be covered here, and apart from the limitations of this cyclopedia. Yet this and a hundred other similar psychological forces must never be forgotten in their effect upon character.

How far such an analysis of the causes of degeneration affect the question of the wisest methods in social reform different minds will differently estimate. Socialists argue that all

**Intem-
perance.**

modern science tends to show that character is almost wholly the result of environment, and hence that by giving right environment vice and crime will disappear, and gradually a race be developed capable of what is to-day impossible. Individualists, while not denying the power of environment upon character, fear that socialism will result in weakened character and impaired individuality, by tending to make men rely too much upon society. (See SOCIALISM; INDIVIDUALISM; EVOLUTION; POVERTY, CAUSES OF; CRIMINOLOGY; PROSTITUTION.)

DEMAND AND SUPPLY in political economy may best be considered together as correlates of each other. *Demand* is the desire to purchase and possess coupled with the power of purchasing; sometimes called, by way of distinction, *effectual demand*—a phrase originated by Adam Smith. Cairns (*Political Economy*, I. ii., sec. 2) defines demand as "the desire for commodities or services seeking its end by an offer of general purchasing power." *Supply* is correlatively the amount or quantity of any commodity that is on the market and is available for purchase. Cairns defines it (*ibid.*) as "the desire for general purchasing power, seeking its end by an offer of specific commodities or services." As, then, the things are correlate, the laws of supply and demand are correlate. Marshall states them thus; first of *Demand* (*Economics of Industry*, pp. 69-71):

"It is a matter of common experience that the larger the stock which sellers determine to sell, the lower will be the price at which it can be got rid of. *Vice versa*, the lower the price at which anything is offered for sale, the greater is the amount of it which can be sold off. Examples occur to us every day. In a good apple year, the price of apples is low; in a bad year it is high. At the end of the season a fashionable shop sells off at a great reduction, and so gets many customers. . . .

"The lower the price that a man has to pay for a thing, the more of it is he likely to buy. A fall in price will not, indeed, make every purchaser increase his purchases. It might in the case of sugar; it would not in the case of carpets. But a fall in the price of carpets would induce some of the householders in a large market to buy new carpets; just as an unhealthy autumn increases the mortality of a large town, though many persons are uninjured by it. For in a large market there must be some who are doubting whether to replace an old carpet by a new one; and their decision will be affected by a fall in the price of carpets. There will not be any exact relation between the fall in price and the increase of demand. A fall of one tenth in the price may increase the sales by a twentieth or by a quarter, or it may double them. But in a large market every fall in price will cause an increase of demand. The law of demand then is:

"The amount of a commodity which finds purchasers in a market in a given time depends on the price at which it is offered for sale, and varies so that the amount demanded is increased by a fall in price and diminished by a rise in price. Its price measures its final utility to each purchaser—that is, the value in use to him of that portion of it which it is only just worth his while to buy."

Of *Supply* Marshall says (p. 76):

"The interest of every producer of a commodity is always to calculate the amount of it that is being produced for market. If this amount seems likely to be small, so that its price will rise above its expenses of production, he will produce as much as he can, so as to derive as much benefit as possible from the high

price which he anticipates. If, on the other hand, the amount brought to market seems likely to be so great that its price will fall below its expenses of production, then he will check his own production so far as he conveniently can. So that if the price of a commodity is likely to be higher than its expenses of production, it is the interest of each producer to do what he can to increase the supply; and the effect of this is to lower the price toward its expenses of production. And if its price is likely to be lower than its expenses of production, it is the interest of each producer to do what he can to check the supply; and the effect of this is to raise the price toward the expenses of production. That is to say:

"Every producer of a commodity calculates the price at which he will be able to sell it, and the expenses of producing it. He thus determines whether to increase or diminish his production. If there is free competition—that is, if he is not acting in combination with other producers—he increases or diminishes his supply according as the price of the commodity seems likely to be greater or less than its expenses of production. Thus he is led by his own interests to act in the same way as he would if his only object were to regulate the amount produced so that it could just be sold off at a price equal to its expenses of production.

"This law of supply may be called the law of normal supply, because it refers to the results that are in the long run brought about by free competition. Of course, all the expenses of production of a thing are themselves liable to variation. Wages may rise and fall, the rate of interest may rise and fall; and so on."

Putting these two laws together, Marshall goes on to say:

"The laws of demand and supply tell us that a rise in price lessens the amount demanded and increases that supplied, and that a fall in price increases the amount demanded and lessens that supplied. This competition tends to make the exchange value such as just to 'equate supply and demand,' i.e., such that the amount that people are willing to sell at that value is equal to the amount which can find purchasers at that value. This tendency of competition to equate supply and demand is the central fact of the theory of exchange, whether applied to normal values or to market fluctuations of value."

Mill says on this point (*Political Economy*, Book III., chap. ii., sec. 4):

"Demand and supply, the quantity demanded and the quantity supplied, will be made equal. If unequal at any moment, competition equalizes them, and the manner in which this is done is by an adjustment of the value. If the demand increases, the value rises; if the demand diminishes, the value falls; again, if the supply falls off, the value rises; and falls, if the supply is increased. The rise or the fall continues until the demand and supply are again equal to one another: and the value which a commodity will bring in any market is no other than the value which, in that market, gives a demand just sufficient to carry off the existing or expected supply."

The above are, perhaps, the best statements of the law of supply and demand, which has played such a large part in economic thought from the days of Adam Smith to the present time. It refers, however, as already stated, only to articles which are not monopolized, and also which cannot be multiplied indefinitely at pleasure. For a discussion of the first case, see MONOPOLY. Other articles have no *exchange value* (*q.v.*), and these need not be studied in the science of exchange, to which the subject of demand and supply belongs. Nevertheless, these exceptions should always be borne in mind, especially at the present, when there is so little of free competition in many industries and so much of combination. The importance of the so-called law of supply and demand, which has hitherto played a part in economic thought, is thus being very rapidly diminished. Certainly, at least, generalizations that have been so rashly made on the subject must be carefully scrutinized, if not

avoided. To say, as is not unfrequently done, that demand is the cause of supply, is as rash as to say that supply creates demand. Many inventions have come into the market before there was an (effectual) demand for them; and for many demands, as for flying machines, there is no supply. No amount of demand will supply a Shakespeare, and no amount of supply can compel a demand for professors of Sanskrit. These are but a few illustrations of the many limits there are to the working of this boasted law. One school of economic thought, the Eight-Hour philosophy (*q.v.*), denies that demand has anything to do, for example, in determining either price or wages; but for this see **WAGES; VALUE.**

DEMOCRACY (from Greek *δημος*, people, and *κρατείν*, to rule) is government by the people, a system of government, or the state where a government exists, according to which the sovereign power is vested in the people as a whole, and is exercised directly by them or by representatives chosen by them. In Greece, whence we derive the name, most of the republics or cities, and notably Athens, were, at their best periods, democracies, if by the word *people* in the definition of democracy is meant *citizens*. Yet they were by no means true democracies, because large classes of the people—some say a large majority—were slaves and not considered citizens, and had no voice in the government. Some even question whether the United States is a democracy, since even here a large half of the people—the women—do not vote. (See **WOMAN'S SUFFRAGE.**) Many writers, like Aristotle, claim that it is not necessary, however, that all classes of the people vote to constitute a democracy. He believes that suffrage should be limited to the citizen class. Where all vote, he says, it is an ochlocracy, or mob government. A modern author, like Professor Burgess, of Columbia (*Political Science and Constitutional Law*, vol. i., p. 72), defines democracy as applied to the State as the rule of the majority. On the other hand, John Stuart Mill, in his *Representative Government*, makes the rule of all, not of a majority, and certainly not of a class, the essence of democracy. He says:

"The pure idea of democracy, according to its definition, is the government of the whole people by the whole people equally represented. Democracy, as commonly conceived and hitherto practised, is the government of the whole people by a mere majority of the people, exclusively represented. The former is synonymous with the equality of all citizens; the latter, strangely confounded with it, is a government of privilege, in favor of the numerical majority, who alone possess practically any voice in the State. This is the inevitable consequence of the manner in which the votes are now taken, to the complete disfranchisement of minorities.

"The confusion of ideas here is great, but it is so easily cleared up, that one would suppose the slightest indication would be sufficient to place the matter in its true light before any mind of average intelligence. It would be so, but for the power of habit; owing to which the simplest idea, if unfamiliar, has as great difficulty in making its way to the mind as a far more complicated one. That the minority must yield to the majority, the smaller number to the greater, is a familiar idea; and accordingly men think there is no necessity for using their minds any further, and it does not occur to them that there is any medium between allowing the smaller number to be equally powerful with the greater, and blotting out the smaller number altogether."

He then goes on to make a strong plea for proportional representation (*q.v.*), and says:

"Nothing is more certain than that the virtual blotting out of the minority is no necessary or natural consequence of freedom; that, far from having any connection with democracy, it is diametrically opposed to the first principle of democracy, representation in proportion to numbers. It is an essential part of democracy that minorities should be adequately represented. No real democracy, nothing but a false show of democracy, is possible without it."

Of the advantages of democracy, he says:

"There is no difficulty in showing that the ideally best form of government is that in which the sovereignty, or supreme controlling power in the last resort, is vested in the entire aggregate of the community; every citizen not only having a voice in the exercise of that ultimate sovereignty, but being, at least occasionally, called on to take an actual part in the government, by the personal discharge of some public function, local or general. . . .

"It is a great discouragement to an individual, and a still greater one to a class, to be left out of the constitution; to be reduced to plead from outside the door to the arbiters of their destiny, not taken into consultation within. The maximum of the invigorating effect of freedom upon the character is only obtained when the person acted on either is, or is

looking forward to becoming, a citizen as fully privileged as any other. What is still more important than even this matter of feeling is the practical discipline which the character obtains from the occasional demand made upon the citizens to exercise, for a time and in their turn, some social function. It is not sufficiently considered how little there is in most men's ordinary life to give any largeness either to their conceptions or to their sentiments. Their work is a routine; not a labor of love, but of self-interest in the most elementary form, the satisfaction of daily wants; neither the thing done nor the process of doing it introduces the mind to thoughts or feelings extending beyond individuals; if instructive books are within their reach, there is no stimulus to read them; and in most cases the individual has no access to any person of cultivation much superior to his own. Giving him something to do for the public supplies, in a measure, all these deficiencies. If circumstances allow the amount of public duty assigned him to be considerable, it makes him an educated man. Notwithstanding the defects of the social system and moral ideas of antiquity, the practice of the dcaistry and the ecclesia raised the intellectual standard of an average Athenian citizen far beyond anything of which there is yet an example in any other mass of men, ancient or modern. The proofs of this are apparent in every page of our great historian of Greece.

"Still more salutary is the moral part of the instruction afforded by the participation of the private citizen, if even rarely, in public functions. He is called upon, while so engaged, to weigh interests not his own; to be guided, in case of conflicting claims, by another rule than his private partialities; to apply, at every turn, principles and maxims which have for their reason of existence the common good; and he usually finds associated with him in the same work minds more familiarized than his own with these ideas and operations, whose study it will be to supply reasons to his understanding, and stimulation to his feeling for the general interest. He is made to feel himself one of the public, and whatever is for their benefit to be for his benefit. Where this school of public spirit does not exist, scarcely any sense is entertained that private persons, in no eminent social situation, owe any duties to society, except to obey the laws and submit to the government. There is no unselfish sentiment of identification with the public. Every thought or feeling, either of interest or of duty, is absorbed in the individual and in the family. The man never thinks of any collective interest, of any objects to be purchased jointly with others, but only in competition with them, and in some measure at their expense. A neighbor not being an ally or an associate, since he is never engaged in any common undertaking for joint benefit, is therefore only a rival. Thus even private morality suffers, while public is actually extinct.

Morality.

So conceiving of democracy, we notice here, tho' briefly, its growth and steady development

in the world. The first democracies of the world were undoubtedly the city-states of ancient Greece. In Sparta the constitution of Lycurgus (about 850 B.C.), tho maintaining the ancient double monarchy, introduced institutions largely democratic. The kings became little more than presidents of a senate elected by the general assembly of citizens over 60 years of age. This assembly (*ἀπέλλα*) could accept or reject all laws and decide on war and peace, etc. Ephors were created to watch over the constitution.

Greek Democracy. The immediate result was to raise Sparta into preeminence in Greece—a position she never wholly lost till she finally fell, last of the Greek States, before the power of Macedon. Yet her democracy was little more than a military oligarchy based upon birth and age. Athens was more really democratic in her best period. After Codrus, the last of her kings (1050 B.C.), the Eupatrids (nobles) ruled with a council (*βουλή*) on Mars Hill (*Areopagus*), tho all citizens could meet in the agora and express assent or dissent. The Eupatrids elected archons; first for life and then for 10 years. B.C. 594 the legislation of Solon created constitutional government, admitting all citizens to a share in power, but giving the higher orders a preponderating influence. This gave way to the dictatorship of the Pisistratidæ till the constitution of Clisthenes (about 509 B.C.) introduced a complete democracy, so far as free citizens went. All such could vote. Ten strategi, elected annually, were the officers. Then came Athens' classic period of the wars with Persia and of art and letters. By a law of 478 B.C. the last property qualification for office was swept away. Yet the continual reelecting of a favorite statesman gave the republic the continuity of brilliant leadership like that of Aristides, Cimon, and Pericles. Yet within a century dissatisfaction with a Sicilian expedition induced the citizens to change their constitution in the direction of aristocracy, resulting finally in defeat by the Macedonian kingdom. (For the ideals and spirit of Greek democracy, see ATHENS; PLATO; ARISTOTLE; POLITICAL SCIENCE.)

Democracy in Rome begins 508 B.C., when the patricians expelled Tarquin, the last of the kings. Rome was now ruled by two prætors or consuls elected by the centuries, in which all freemen were enrolled. Then came the long struggle between the patricians and plebeians; the oppressions of the former; the secessions of the latter from the city; the creation of tribunes to defend the rights of the people; the election of the decemvirs; the return to the consulate; the creation of censors and military tribunes; the growing militarism; the division between the rich and the poor; the agrarian laws of the Gracchi; the triumph of the aristocracy; the creation of the triumvirs; the development of the empire. Yet through all these changes ran the ideal of the people as sovereign. (See POLITICAL SCIENCE.) Lecky says (*History of European Morals*, vol. i., chap. ii.) that even under the empire "the theory of the Roman Empire was that of a representative despotism. The various offices of the republic were not annihilated,

but they were gradually concentrated in a single man."

Democracy among Germanic nations begins with the mark or clan where the eorls or earls (leading men) elected their chief or voted war and peace, while the free eorls or churls declared assent by the clash of arms. This early democracy, however, gradually disappeared in the development of feudalism, save in the rights maintained in communities like the Russian *mir*; and, above all, in the *Landsgemeinde*, the Swiss cantons. (See COMMUNISM; REFERENDUM.)

The real democracy of the Middle Ages is to be found in the rise of the free cities and centers of art, trade, and commerce, like Florence, Pisa, Venice, and Genoa in the south, and Hamburg, Nuremberg, and Frankfurt in the north. (See CITY.) The southern cities aimed at avowed republicanism, perhaps, more than the northern, but save for fitful periods, as in Florence, were really under dukes and aristocracies more than the northern cities. In the northern free cities one finds the real parent of modern democracy.

Modern democracy begins as an idea with the Christian teaching of the brotherhood of man, the Protestant teaching of the right of private judgment, and of the responsibility of the individual to God alone. It is developed in theory of the social compact by Locke, Rousseau, and the various French writers of the eighteenth century. (For the ideas of this period, see NATURAL RIGHTS.)

Modern Times.

But all history enters into modern democracy. Says De Tocqueville in the Introduction to his *Democracy in America*:

"We shall scarcely meet with a single great event in the lapse of 700 years which has not turned to the advantage of equality. . . . The gradual development of the equality of conditions is therefore a providential fact, and it possesses all the characteristics of a divine decree; it is universal; it is durable; it constantly illudes all human interference, and all events as well as all men contribute to it."

Democracy began, according to De Tocqueville, with the Church, when the clergy opened her ranks to all classes, and "the being who as a serf must have vegetated in perpetual bondage took his place as a priest in the midst of nobles, and not infrequently above the head of kings." Next, he says, the need of civil laws gave the legal functionary a place by the mailed baron. Thirdly, the nobility being exhausted by wars and the lower classes enriched by commerce, the man of money gained position by the side of the man of birth. Next, education, science, and literature opened to any one of ability avenues to power. "In the eleventh century nobility was beyond all price; in the thirteenth it might be purchased; it was conferred for the first time in 1270. . . . It sometimes happened that in order to resist the authority of the crown or to diminish the power of their rivals, the nobles granted a certain share of political rights to the people, or, more frequently, the kings permitted the lower orders to enjoy a degree of power, with the intention of repressing the aristocracy. . . . Some assisted democracy by their talents; others by their vices. Louis XI. and Louis XIV. reduced every rank beneath the throne to the same subjection; Louis XV. descended himself and all his court unto the dust."

But modern democracy finds its first chief actual development in the United States, tho descended from English ancestry. Parliament was in a sense the continuation or revival of the ancient Witenagemote, or meeting of the wise men (eorls) of all England. If it did not rule England in form, it did rule through the purse. The connection between taxation and repre-

sentation, the idea that no man could be taxed save by his own consent—that and the kindred idea embodied in the Great Charter won from King John, that no man could be condemned without a trial

English Democracy. by his peers—"by the country" (see JURY), lie at the basis of English and American ideas of freedom.

The overthrow of feudalism, the struggle with Charles, the Revolution of 1688, the development of constitutional government, had made England to an extent democratic by confiding its government to a Parliament elected by a limited suffrage to represent the people. The American colonies held the same ideal of democracy, no more and no less. The doctrines of natural rights (*q.v.*) and the social compact to some extent found acceptance in America; but this was balanced by the constructive common sense of an English race and in the true spirit of Burke, the consciousness of national development. "No men were less revolutionary in spirit," says Bryce, "than the fathers of the American Revolution."

The United States. The spirit of George Washington and John Adams was opposed to the ideas of Paine, of Rousseau, and even of Jefferson. Hamilton openly preferred monarchy to democracy, which he feared would overthrow morals and property and end in despotism. American democracy was thus a healthy natural development almost forced by circumstances on the people, and developed by a race jealous for rights. (For the constitutional development of American democracy, see CONSTITUTION; CENTRALIZATION.)

De Tocqueville, who studied America in 1831, found one of its fundamental characteristics and safeguards its connection between liberty and religion. "The safeguard of morality," he says, "is religion, and morality is the best security of law and the surest pledge of freedom." Another great tendency which he finds in the United States at this period is one to decentralization. The town meeting is the ideal. This results in weak, irregular administration, but its political results are admirable in interesting all portions of the land in government. "The town meeting is to liberty what primary schools are to science." De Tocqueville believed very much more in the future of the States than of the Union; he believed that would go to pieces when the States desired it or differed in policy. How completely his view has been disproved is well known, but he touched here on the burning question of American politics for more than half a century. The constitution of the Federal Government, however, he highly praises. Its balanced division of powers he considers necessary and admirable. The election of the President by electors he terms a most happy device. He deplures, however, the custom of electing representatives as mere delegates bound by instructions as tending to destroy representative government. The practice of electing judges he criticizes, and praises the independence of the Supreme Court; the speaking of the power of that court to judge as to the constitutionality and therefore legality of any bill, he says, "A more imposing judicial power was never constituted by any people." He fears the power of majorities, and says that the main evil of democratic institutions in the United States arises "not from their weakness, but from their overpowering strength;" he is "not so much alarmed at the excessive liberty which reigns in that country as at the very inadequate securities which exist against tyranny. . . . If ever the free institutions of America are destroyed, that event may be attributed to the unlimited authority of the majority, which may at some future time urge the minority to desperation and oblige them to have recourse to physical force." This danger, however, is mitigated by the

absence of centralized power, the wise laws, and especially by the morality, religion, and intelligence of the people. "Despotism may govern without faith, but liberty cannot."

With these institutions, De Tocqueville says, "the Union is as happy and free as a small people and as glorious and strong as a great nation."

The effects of democracy upon the people of the United States, he considers to be to produce mediocrity. They worship equality more than liberty. Great political parties, he says, have disappeared. The country contains few germs of revolution; America has factions but not conspiracies, the race of statesmen has dwindled. Universal suffrage does not guarantee wise choice of officers. Democracies are better in times of peace than of war. They develop the activities of the individual. De Tocqueville says: "This ceaseless agitation which democratic government has introduced into the political world influences all social intercourse. I am not sure that upon the whole this is not the greatest advantage of democracy. And I am much less inclined to applaud it for what it does than for what it causes to be done."

Such was the view of the most careful critic of American institutions at the close of the first third of the present century. How accurately he judged upon some points, how utterly events have proved him wrong upon others, is apparent. The Union is stronger to-day than the States; democratic government in the United States has not been proven weak in war or fickle in time of peace. Majorities have rarely been tyrannical. Of the faults which have appeared, Mr. Bryce, writing in 1888, says (*American Commonwealth*, 1st ed., chap. xcv.):

"We have seen that the defects commonly attributed to democratic government are not specially characteristic of the United States. It remains to inquire what are the peculiar blemishes which the country does show. . . .

"First, a certain commonness of mind and tone, a want of dignity and elevation in and about the conduct of public affairs, an insensibility to the nobler aspects and finer responsibilities of national life.

"Secondly, a certain apathy among the luxurious classes and fastidious minds, who find themselves of no more account than the ordinary voter, and are disgusted by the superficial vulgarities of public life.

"Thirdly, a want of knowledge, tact, and judgment in the details of legislation, as well as in administration, with an inadequate recognition of the difficulty of these kinds of work, and of the worth of special experience and skill in dealing with them. Because it is incompetent, the multitude will not feel its incompetence, and will not seek or defer to the counsels of those who possess the requisite capacity.

"Fourthly, laxity in the management of public business."

Mr. Lecky, however, in his still more recent *Democracy and Liberty* (1896), is much more severe on the United States. Its success he considers largely due to its wise Constitution and the very favorable circumstances of its trial. Yet he points out no little corruption (see articles CONGRESS, PLUTOCRACY), and then adds:

"There is, however, one thing which is worse than corruption. It is acquiescence in corruption. No feature of American life strikes a stranger so powerfully as the extraordinary indifference, partly cynicism and partly good nature, with which notorious frauds and notorious corruption in the sphere of politics are viewed by American public opinion." Of one other point Mr. Lecky says: "It must, I think, be added, that modern democracy is not favorable to the higher forms of intellectual life. Democracy levels down quite as much as it levels up. The belief in the equality of man, the total abstinence of the spirit of reverence, the apotheosis of the average judgment, the fever and the haste, the advertising and sensational spirit which American life so abundantly generates, and which the American press so vividly reflects, are little favorable to the production

Lecky's View.

of great works of beauty or of thought, of long meditation, of sober taste, of serious, uninterrupted study. Such works have been produced in America, but in small numbers and under adverse conditions."

So far Mr. Lecky. He seems to consider most of these faults the direct natural and all but inevitable result of democratic institutions, tho he considers them "aggravated" by the unnecessary rule that congressmen must belong to the States they represent, and that senators should receive large salaries.

Mr. Lecky, however, does not seem to see how far political corruption in America is the result, not of democracy, but of commercialism and that moneyed aristocracy which De Tocqueville bade Democrats fear 60 years ago. Lecky does, indeed, say that the industrialism of American life is one of its most characteristic features, and that its influence on politics has been by no means wholly good; he does also notice the fact that in wealthy America, in 1893 alone, 30,000 miles of our railways passed into the hands of receivers, and says, "What an amount of gigantic and deliberate dishonesty as well as unscrupulous gambling does such a state of things represent!" But he does not seem to have a suspicion how far corporations corrupt democracy, and not democracy corporations. Of this, however, we shall speak later. We pass on to notice briefly the result of democracy in other lands.

Europe. French democracy was born of ideals of natural rights falling on a nation perhaps more despotically ruled than any in Europe. These ideals, with those of altruism, as Mr. Kidd has pointed out in his *Social Evolution*, made even the aristocracy aware that their position was unjust, and prevented their effectually opposing the uprising of the oppressed. The result was an explosion. Says De Tocqueville of French democracy (Introduction to *Democracy in America*):

"The existence of democracy was seemingly unknown when on a sudden it took possession of the supreme power. . . . The theory was then submitted to its caprices; it was worshipped as the idol of strength, until, when it was enfeebled by its own excesses, the legislator conceived the rash project of annihilating its power, instead of instructing and correcting its vices. The consequence of this has been that the democratic revolution has been effected only in the material parts of society, without that concomitant change in laws, ideas, customs, and manners which was necessary to render such a revolution beneficial."

This view of a French opponent of democracy, written 60 years ago, is to a less extent true to-day. The French Revolution was one of the middle classes rather than of the lowest. The mass of the people were not ready for it. France, therefore, during the century has vibrated between emperor and commune. Plebiscites have served tyrants. Between 1800 and 1881 France had 11 revolutions and 19 successive constitutions, and between 1870 and 1894, 32 ministries.

Still democracy has steadily grown, and is now probably more firmly established in France than ever. Her suffrage is all but universal, the main restrictions on her democracy being in the Senate, and, for Paris, in its lack of self-government. (See PARIS.) No one is enthusiastic over the French Government. Panama

scandals, coquetting with Russia, the steady growth of her national debt and of taxation, in spite of her widely diffused land property and her popular loans, have made socialism and, to a less extent anarchism, the popular idols in France.

Switzerland is undoubtedly the most democratic and one of the most prosperous countries in Europe. Her well-known referendum and initiative we consider under that head. In Switzerland far more than in America the people rule. This is undoubtedly in part because of the smallness of her territory and of the fact that her commercial and industrial interests have not called into existence the great corporations which dominate and corrupt American politics; but believers in democracy argue that Switzerland shows that the cure for the ills of democracy is more democracy. France and America, they say, are plutocracies. With the referendum and the initiative, so that the legislative power is with the people, with a president (see SWITZERLAND) who is little more than a figurehead, with a government largely decentralized between cantons and municipalities, with a judiciary not allowed to enslave a people by interpreting a constitution framed in other days for other needs, Switzerland is really democratic, and tho not a land of extreme wealth, she holds high rank in popular learning, industry, and prosperity for her people.

Other countries in Europe, tho nominally monarchies, are, as in England, Germany, and Belgium, almost as democratic in many respects as America or France. In the extent of national as opposed to municipal suffrage, they rank almost with America. (See ELECTIONS.) They groan under standing armies, but so does republican France. Their legislatures represent the classes more than the masses; but England has 13 labor men in Parliament, Germany has 44 socialists in her Reichstag, Italy 15 in her Parliament, France from 40 to 55, Belgium 33, Holland 10, while in the Congress of the United States there are no working men. Where do the people most truly rule?

Coming now to the arguments for and against democracy, Mr. Lecky, its latest critic, says of its evil results:

"Sometimes the voter will be directly bribed or intimidated. He will vote for money or for drink or in order to win the favor or avert the displeasure of some one who is more powerful than himself. . . . A still larger number of votes will be won by persistent appeals to class cupidities. . . . If the poorest, most numerous, and most ignorant class can be persuaded to hate the smaller class, and to vote solely for the purpose of injuring them, the party manager will have achieved his end. . . . As education advances, news-

papers arise which are intended solely for this purpose, and they are often almost the only reading of great numbers of voters. As far as the most ignorant class have opinions of their own, they will be of the vaguest and most childlike nature. . . . A man will vote blue or yellow as his father did before him. . . . A few strong biases of class or creed will often display a great vitality. Large numbers, also, will naturally vote on what is called 'the turn-about system.' . . . A bad harvest or some other disaster over which the government can have no more influence than over the march of the planets will produce a discontent that will govern dubious votes. . . . The evil of evils in our present politics is that the constituencies can no longer be fully trusted, and that their power is so nearly absolute. . . . One of the great divisions

Unfavorable View.

of politics in our day is coming to be whether, at the last resort, the world should be governed by its ignorance or by its intelligence." Some results of democracy Lecky considers to be a lowered character of parliamentary government over all Europe and America. All countries give a sigh of relief when legislatures are prorogued. Wealth still rises, but wealth of the worst kind. Taxes and debts are increased, one class "has the power of voting taxes, which another class must almost exclusively pay." Group system and log-rolling are developed, machines govern parties.

There is, however, another side to this. Even Lecky has to admit that democratic institutions have enormously advanced both the quantity and the quality of popular education, have made enormous strides in caring for the public health, have aided factory legislation, have been favorable to religious liberty.

It is true that he carefully shows that popular education does not accomplish all the good sometimes claimed, but yet he cannot bring himself to actually

Favorable View.

oppose, and he has to admit that opposition to much education for the toiling classes was a Tory doctrine, and that under democracy "hardly any change in our generation has been more marked than that which has made education of the poor one of the main functions of the Government. . . . At the same time," he says, "the standard of popular and free or, in other words, State paid education, seems steadily rising." Sanitary reform he calls "perhaps the noblest legislative achievement of our age." Of religious liberty he says, "On the whole, democracies, at least in the Anglo-Saxon race, seem to me favorable to religious liberty." No forms of liberty are more loved by English democracies than the liberty of expression, discussion, and association. Incidentally he speaks of "the higher wages, the better payment of functionaries and workmen of every order which has followed in the track of a higher standard of life and aspect." He refers to the "intense and many-sided intellectual and moral energy that pervades the country." He thinks there never was a period when more time, thought, money, and labor were bestowed on the alleviation of suffering. He says, "No feature of our century is more remarkable than the skill with which by reformatories and industrial and other schools, by factory laws, by the diminution of insanitary dwellings, and by the better regulation of the drink traffic, modern philanthropy has succeeded in restricting or purifying the chief sources of national crime." . . . "Not less conspicuous is the improvement that has taken place in the decorum, civilization and humanity of the bulk of the poor. . . . [while] the skilled artisans in our great towns within the memory of living men have become not only the most energetic, but also one of the most intelligent and orderly elements in English life." The closing chapter in Mr. Lecky's book in which he shows the almost revolutionary improvements that democracy has introduced in respect to women is one long argument for democracy. Surely if a critic of democracy has to admit all this, we need not regret that, as Mr. Lecky says, democracy is for a considerable time at least "an inevitable fact."

The main charge Mr. Lecky brings against democracy is that it makes the poor tax the rich, but most will think that that is an advance on the Toryism under which the rich tax the poor. Probably, too, it is true that democratic legislatures will be for some time in some ways inferior to aristocratic legislatures, because they admit representatives of classes whom aristocrats have long kept ignorant. But if democracy educates the people and raises their life, it will soon raise the standard of the representatives of the people. Democracy, as De Tocqueville discovered, is best because of its indirect results.

There are, indeed, those in America—and the number is at present growing—who ask if democracy is not a failure; they see the voters of our cities bought and sold; they see offices

put up at auction, legislation obtained by corrupt means. They think this due to the ignorance and corruption of the people, and therefore they desire from good motives to restrict the ballot. They look with envy to the institutions of Great Britain and of Germany, where they find less political corruption and more efficient government. This class forgets that political corruption may be due, not to the ignorance of those who are bought, but to the corrupt power of the educated, who buy. They forget that England **Cause of** and Germany have recently made **Plutocracy.** rapid advances in democracy, and that as they have advanced in trust of the people they have advanced and not retrograded in political and municipal purity. The reason for their comparative municipal purity and our municipal corruption may be, not that they are less democratic than we, but because with them the Government rules the corporations; with us corporations rule the Government. (See CRRY.) This, at least, is a view that needs to be remembered. Whatever be the truth, the fact cannot be denied that a growing class in America desire to restrict the suffrage, to have less frequent elections, to take power from the common people. One of the "reforms" pressed before the recent Constitutional Convention in New York was the restriction of the suffrage. In Massachusetts, the effort for less frequent elections has been very strong. In many States "educational and sometimes property qualifications" are being mooted. In Ohio, the counsel of a great trust recently said, in a United States court, that "too many people vote." It is equally clear that this does not represent the view of the masses of the country, nor of some of the most experienced thinkers. Professor Ely (*Christian Union*, October 9, 1890) quotes Mr. Seth Low, when Mayor of Brooklyn, as saying that universal suffrage is not the cause of bad city government. Professor Commons, in *Outlines of Lectures on City Government*, quotes him as saying: "In a country where wealth has no hereditary sense of obligation to its neighbors, it is hard to conceive what would be the condition of society if universal suffrage did not compel every one having property to consider, to some extent at least, the well-being of the whole community." Mr. Albert Shaw, who perhaps has studied municipal administration more widely than any other writer, in an interview published by the *Pall Mall Gazette*, November 27, 1888, makes it the second most important principle of municipal administration to "trust the people."

The masses of this country want not less democracy, but more. They want not a limited suffrage, but industrial democracy added to political democracy. Their problem is not how to limit the suffrage, but how to save the political liberties of the people. Mr. Henry D. Lloyd, in an address before the Annual Convention of the American Federation of Labor, in Chicago, December, 1893, speaking of present evils in America, said:

"The pioneers who saw a generation ago the thread that would lead us through this labyrinth and into the free air have now become a multitude. That thread is the thread of democracy, whose principles must and will rule wherever men coexist, in industry not less surely

than in politics. It is by the people who do the work that the hours of labor, the conditions of employment, the division of the produce is to be determined. It is by them the captains of industry are to be chosen, and chosen to be servants, not masters. It is for the welfare of all that the coordinated labor of all must be directed. Industry, like government, exists only by the cooperation of all, and, like government, it must guarantee equal protection to all. This is democracy, and democracy is not true only where men carry letters or build forts, but wherever they meet in common efforts.

"The declaration of independence yesterday meant self-government, to-day it means self-employment, which is but another kind of self-government. Every dollar, every edifice, every product of human toil is the creation of the cooperation of all the people. But in this cooperation it is the share of the majority to have no voice, to do the hardest work and feed on the crumbs of life. Not as an exception, but universally, labor is doing what it does not want to do, and not getting what it wants or what it needs. Laborers want to work eight hours a day; they must work ten, fourteen, eighteen. Crying to their employers, to Congress, to legislatures to be rescued, they go down under the murderous couplers and wheels of the railroads faster than if they were in active

Need of Industrial Democracy.

service in war, marching out of one battle into another. They want to send their children to school; they must send them to the factory. They want their wives to keep house for them; but they, too, must throw some shuttle or guide some wheel. They must work when they are sick; they must stop work at another's will. . . . This is an impossible situation. No human society ever held together on such terms. This is contrary to the most sacred principles of American society. This is government without consent, and it is the corner-stone and roof-tree of American life that we will have none of it. The men who think it can continue are our idlest dreamers and most impracticable theorists. . . .

"Democracy must be progressive or die. It was by a divine instinct of right, whether they knew it or not, that the hundreds of men who found themselves these winter nights in Chicago without a roof went to the city hall. That is the house of democracy. It stands on the foundation principle that the people live and work for the people. The city hall means nothing if it does not mean that the general welfare, not the advantages or privileges of a few, is the object of society. It means more—the general welfare can be properly planned only if all have a voice, and the plans can be properly carried out only when all join their efforts. The city hall represents an institution ready made for any purpose of the common good for which the common people choose to use it—an institution in which they are equal partners, and no thanks to any one but themselves. The old democracy is the father of this new democracy. The old trade-union is to herald this greater union. The people who vote are bound on their own recognition to get the independence and knowledge to vote right and free. The public schools are a pledge of the public honor that every citizen shall be able to buy books and shall have time to read and digest.

"The progressive genius of democracy is at one with its progressive necessities. 'A house divided against itself cannot stand,' said Lincoln. 'This union cannot permanently endure half slave and half free.' It is equally true that all cannot remain politically free if all are not economically free. Political freedom is but the first installment of economic freedom."

Nor is this the view of those alone who are socialistically inclined. Mr. George Gunton, who opposes socialism, says (*Wealth and Progress*, p. 205):

"Freedom does not consist in the mere absence of legal barriers, but in the actual power to go and to do. The poor can never be free in any true sense of the term. Whoever controls a man's living can determine his liberty. Freedom means independence, which nothing but wealth can impart. Even intelligence cannot give independence, except as it can give wealth. Poverty and freedom are incompatible with each other.

"Whatever may be, theoretically, the form of government, the political freedom—real power and influence—of the masses is always proportionate to their industrial prosperity and progress. Thus, the political influence of the masses is far greater under the present

European monarchies than it was under the ancient republics. And the political influence of the masses is greatest to-day in those countries where the industrial conditions—real wages—are the highest. The laboring classes possess more political influence and freedom in England under a monarchy with higher wages, than they do in France under a republic with lower wages; and there is still more real democracy with higher wages under a republic in America than with lower wages under a monarchy in England. . . .

"It is not and never was true that liberty enlightens the world. On the contrary, our democratic institutions are the natural consequence of our industrial prosperity and superior civilization; and liberty, like morality, instead of enlightening the world, is the golden result of the world's being enlightened by the material and social progress of society. Were this otherwise, the industrial depressions which afflict the Old World would be unknown here. The notorious fact is that the frequency and severity of industrial depressions are as great under the democracies of France and America as under the monarchies of England, Germany, and Belgium."

Such is a view of democracy that is growing to-day.

Be this, however, as it may, democracy unquestionably for weal or for woe has the future. Mr. Kidd, in his *Social Evolution*, shows that it is the underlying principle of all modern progress. Of this progress, he says (p. 164):

"It has consisted essentially in the gradual breaking down of that military organization of society which had previously prevailed in the emancipation and enfranchisement of the great body of the people, hitherto universally excluded under that constitution of society from all participation on equal terms in the rivalry of existence. From a remote time down unto the period in which we are living, we have witnessed a continuous movement in this direction. The progress may not have been always visible to the current generation among whom the rising waves surge backward and forward, but looking back over our history, we mark unmistakably the unceasing onward progress of the slowly advancing tide. . . . And it tends to culminate in a condition of society in which there shall be no privileged classes" (p. 164).

Growth of Democracy.

The only question, then, is, accepting democracy, how to save it from defeat, from corruption, from misdirection. For this see various views: Direct Representation, through which it is claimed all the people can legislate, and thus take away from corrupt representatives the power to sell legislation; Proportional Representation, by which it is urged that all parties and all views and all interests can be represented in legislation, the rights of minorities being specially protected; Industrial Reform, by which all being put on the same plane economically and being able to earn a living by a moderate amount of honest toil, will not be easily tempted to either sell their vote or buy legislation. (See also ANARCHISM; CHRISTIAN SOCIALISM; CIVIL SERVICE REFORM; MUNICIPAL REFORM; INDIVIDUALISM; SINGLE TAX; SOCIALISM; TEMPERANCE.) All these are claimed by various schools of thought as necessary to the realization of democracy.

DEMOCRATIC PARTY, THE.—The causes of the rise of the Democratic Party may be briefly stated as follows: The Constitution of the United States, which went into effect March 4, 1789, had been adopted only after a hard struggle. It was declared by many that the Constitution gave too much power to the central government. Men said that liberty would perish. It was asserted that freedom won from George III. was being slain by her own children. The vote to ratify was nearly defeated in Massachusetts and New York. It took all the skill of Washington, and Franklin, and Hamilton to get it ratified. The States were jealous of the powers given to the Federal Government, and the people were jealous of power given to any government. The Constitution was only adopted because it was believed that the powers were so divided between the

different branches of the Government and each branch so carefully tied up with constitutional limitations that no branch could gain too much power. Nevertheless, even so, a strong anti-federalist sentiment or party sprung up, holding that the Constitution should be strictly interpreted and government only be allowed what the Constitution plainly authorized on the strictest interpretation. All other powers, they held, were reserved for the people. It was this feeling which led to what we know to-day as the Democratic Party, but which was first organized under other names.

It may be said to have become a party as early as 1792. The Federalist policy of the administration of Washington only increased the anti-Federalist feeling. In particular was the financial management of Hamilton and the neutrality of this country in the war between France and Spain obnoxious to the anti-Federalists. France to them represented democracy and England aristocracy; the one was loved, the other hated.

An impression got abroad that the Federalists were anti-republican, and that they actually wished for a monarchy. These various elements of disagreement with the policy of the administration began to coalesce into avowed opposition. Jefferson was the leader, and was not backward in opposing by letters and speeches the administration of Washington. The party first took the name of the Republican Party, since it claimed that the Federalists were anti-republican. The first authoritative use of this party name occurs in a letter of Jefferson to Washington, May 13, 1792.

Name. From 1793-96, however, the party took the name of the Democratic-Republican Party in order the better to win the allegiance of the French or democratic school of thought. This is still the official title of the party; but about 1829, when a nationalizing faction had broken off and called themselves National Republicans (see **WHIG PARTY**), the residue adopted the name Democrat, by which the party is to-day popularly known.

The fundamental principle of the party, Jefferson said, was "the cherishment of the people." It believed that that was the best government which governed least. It advocated State rights against too extended federal

power. It stood for a rigid economy in the moneys voted for government expenditure. Its leaders believed in or affected great plainness of dress and conduct in government officials. It stood for the strict construction not only of the Federal Constitution, but of all State constitution and municipal charters. Back of Congress, to an extent above Congress, was the sovereign State. Back of the State, and in a sense above the State, was the town meeting or the local political unit. Back of the town meeting were John Smith and Henry Jones, and Congress, State, or town meeting could only do what John Smith and Henry Jones had explicitly contracted or voted that they might do. On the other hand, the Federalists felt that a somewhat liberal interpretation of the Constitution and a somewhat extended conception of the function of the Federal Government was absolutely necessary to the prosperity and independence of the country; that otherwise it would be little more than a loose federation of petty sovereign and competing republics, like those of South America. Particularly did Hamilton carry this out in his financial policy. This immediately raised somewhat of a sectional feeling. The South was almost wholly agricultural and anti-Federalist. The North was commercial and more federalist. Of the national debt Jefferson said the South "owed the debt while the North owned it." The anti-Federalists, too, strongly objected to the administration's policy of a national bank. (See **BANKS AND BANKING**.)

The first test of political strength came in the elections of 1792, tho it was scarcely a real test of strength, for Washington, as in 1789, was easily reelected President, and what anti-Federalist or Democratic opposition there was scattered between various candidates; but when the third Congress was organized in 1793 the Republicans (Democrats) were in the majority. In 1796 there was more of a test contest. John Adams, the Federalist candidate, received 71 electoral votes, and was elected, but Jefferson received 68, and became Vice-President. The administration of Adams helped the Republicans (Democrats) still more. It was during his administration that the famous alien and sedition laws were passed, an exercise of power by Congress which the new party considered unconstitutional beyond a doubt. The act was taken by the Democrats as a sign that tyranny was rapidly developing. Jefferson considered these laws a nullity as "absolute and palpable as if Congress had ordered us to fall down and worship a graven image." The party, led by Jefferson and Madison, protested in the well-known Virginia and Kentucky Resolutions of 1798 and 1799. Their spirit has been the spirit of the party ever since, and gave the clearest expression yet of the doctrine of State rights. In the next election, 1800, the Republicans (Democrats) carried the election, and held the power for 24 years. **Jefferson.**

First Election. Jefferson was elected President, and Burr, also Republican (Democrat), Vice-President. House and Senate were also of the same party. The party also captured

most of the States, but was so successful that divisions began to result. Radical and conservative Republicans began to appear. Jefferson's administration was popular, and not the least the Louisiana purchase, tho it was doubtful if any authority for this could be found in the Constitution. In 1804 Jefferson was reelected President and George Clinton Vice-President. The administration now, however, adopted a policy which raised opposition in its own party. It favored building small gunboats for coast defense rather than a strong navy for the defense of commerce, and claimed that agriculture was America's true interest, not commerce. This would have defeated the party in 1812 except for the growth of the Western States, and Madison, the party candidate, was successful. The opposition in the party, however, increased, led by Henry Clay and Story (afterward Chief Justice). The opposition favored a much more national policy, and Madison, tho adverse to it, was coerced into following a war policy, and the War of 1812 was declared. This made the more national policy of the Republican (Democratic) Party popular, and the Federalists (*g. v.*) all but disappeared. The triumphant party, however, acted very little on its original principles. In 1816 it established a new national bank, modeled after Hamilton's, and imposed a low protective duty.

Monroe. In 1816 Monroe, of Virginia, was triumphantly elected. In 1819-20 the House passed a still higher tariff, which the Senate rejected; but in 1824 a still higher tariff became law. In 1820, in the so-called "era of good feeling," Monroe was reelected almost without opposition. In that year Florida was bought and Missouri was admitted as a slave State. This led to large consequences; henceforth the party, strong in the South, lost in the North, and for 40 years the party at the North had to excuse the course of the South. The party was broken up in 1824, and John Quincy Adams was elected, nominally of the party, but by old Federal votes. He was opposed by the bulk of his party, an opposition which ended in the election in 1828 of Andrew Jackson. At this election the people for the first time really assumed control of the Government, because in all the older States there had been various property qualifications to the suffrage. The admission of newer States without these qualifications had now given the people power. Adams and Jackson had both called themselves Republicans, Adams leading the "administration wing" and Jackson "the opposition wing;" but after the election the Adams men called themselves more and more the "National" Party, while the Jackson men called themselves Democrats or Republican-Democrats. Jackson stood for no policy save one of opposition to Adams, and when in power he first

Jackson. used the national appointing power to strengthen his party and reward his friends. "To the victors belong the spoils" from thenceforward became a too well-known motto. He also favored the theory of the rotation in office. He developed a strong strict constructionist policy, and a conflict against the national bank. (See BANKS.) In the matter of internal improve-

ments and of a national bank Jackson's policy signally triumphed, but he was not so fortunate in the matter of the tariff. In 1832 a protective tariff was passed by Congress, which he thought his best course to sign.

At the end of Jackson's second term Van Buren, who had been Secretary of State and then Vice-President with Jackson, was elected against the Whig candidate in 1836. By this time the organization of the Democratic Party had been systematized much as we see it today. In the national convention of the party at Baltimore, May 5, 1840, what we call a platform was put forth for the first time. It declared that the Federal Government was one of limited powers, opposed expenditure for public improvements and a charter for a United States bank, and favored a tariff for revenue only. No substantial change was made in the various platforms of the party in following years till 1864. Owing to depression, ascribed by the Whigs to the opposition of the Democrats to commercial interests, Van Buren was defeated for a second term by Harrison, who was, however, soon succeeded by Tyler. The Democrats, however, again won with Polk in 1844. The issue in the campaign

Slavery.

had been the annexation of Texas; for now the slavery element was in control of the Democratic Party and determined to gain its ends. The men in power had little of the prudent policy of Van Buren and the leaders of Jackson's time. The war with Mexico followed. As a result a large territory was added to the country. The Wilmot Proviso, which excluded slavery from this territory, was disapproved of by the Southern division of the party, and the Northern Democrats had to yield. But these dissensions in the party led to its defeat in 1848, and Zachary Taylor (Whig) was elected. This administration, however, gradually saw the Whig Party disappear, the Free Soil Party develop, and the Democratic Party become a party in the complete control of the South. This division of the Whigs led to the success of the Democrats in 1852 and the election of Franklin Pierce.

The Southern majorities for Pierce were heavy, and the Southern men naturally claimed preeminence. Many of these leaders were lacking in prudence and altogether too aggressive in advocacy of the claims of slavery. These new Southerners were such men as Davis, Stephens, Toombs of Georgia, and R. C. Breckenridge of Kentucky. Stephen A. Douglas was almost the only great Democratic leader in the North. He stood for the "popular sovereignty" doctrine, and in 1854 brought forward his Kansas-Nebraska Bill. The Missouri Compromise had forbidden slavery north of the parallel of 36° 30'. The new Territory of Kansas-Nebraska lying north of this limit would naturally be free. But the Kansas-Nebraska Bill asserted the principle of non-intervention by Congress in regard to slavery in States and Territories, and declared the **Missouri** prohibition of slavery in the **Missouri** **Compromise** Act to be void. The passage of the bill by Congress led immediately to the revolt of many Northern Democrats, and by the union of these men with

the Northern Whigs and with other elements the Republican Party was formed. But all the Northern Whigs had not yet joined the new party, and hence another Presidential victory was possible for the Democrats. They put up a very moderate man in 1856, Buchanan, and he was elected, tho he had not a majority of the popular vote. But Buchanan's administration was the last the Democratic Party was to control for years to come. There was fighting in Kansas between the Free State and the Slave State settlers. The Kansas-Nebraska Bill had deeply moved the spirit of the North, and the Democratic Party was to split on that rock. At the convention at Charleston, S. C., April 23, 1860, the Southern and Northern delegates could not agree upon the question of the legality of slavery in the Territories. The Douglas Democrats triumphed, and the Southern men withdrew. Douglas was nominated by the original convention and Breckenridge by the seceding one. Lincoln, however, the Republican candidate, was elected by 180 out of 303 electoral votes, and the Civil War was precipitated.

For many events of the period 1860-95 see **REPUBLICAN PARTY**. The Democratic Party has been for much of this period in opposition. The leading Democrats of the North, as soon as the war broke out, became

War Period. "War Democrats," and many of them in time Republicans. But the party rallied as the war went on

and began to advocate peace. The suspension of the *habeas corpus act* gave rise to a cry against Lincoln's government. The Democratic platform of 1864 denounced the management of the war, and called for efforts for peace. McClellan was the candidate chosen, and he was badly defeated by Lincoln. The party protested in vain against the Reconstruction measures. It, however, succeeded in securing the acquittal of President Johnson on his impeachment.

The candidate for the Presidency in 1868, Governor Seymour, of New York, was defeated. A natural reaction from the forcible Reconstruction policy was now beginning. A Liberal Republican convention, intended to unite Democrats and Liberal Republicans, was held at Cincinnati in 1872, and nominated Horace Greeley, of New York. The Democratic convention at Baltimore ratified the Cincinnati platform, but Greeley was not acceptable to many Democrats, and received but 66 out of 352 electoral votes. In the forty-fourth Congress in 1875 the Democrats for the first time for years had a large majority in the House of Representatives, and maintained it till 1881. At one time they controlled the Senate, but the Southern vote was divided on many questions, and no great measures were passed. The platform of 1876, however, demanded a tariff for revenue only, and reform in the administration of the government. Samuel J. Tilden, of New York, was the nominee, and the result of the voting was in dispute. The Republicans had 184 electoral votes, one short of the necessary number. But in Florida and Louisiana the so-called returning boards reversed the popular vote, and gave the States to Hayes, the Republican candidate. Feeling ran so high over this that Congress created an elec-

toral commission, composed of five senators, five representatives, and five justices of the Supreme Court, which counted the votes in favor of Hayes, 8 to 7, and he was inaugurated. In 1878-79 occurred in the House of Representatives a contest over the appropriation bills. In 1880 General Winfield S. Hancock, of Pennsylvania, was the candidate of the party for President, and was defeated by Garfield. It was not until 1893 that the Democrats secured control of all branches of the Government. Meanwhile, in 1884, they had succeeded in electing to the Presidency Mr. Cleveland, then Governor of New York, over Blaine. The vote was very close. The contest was fought on the tariff issue and that of reform, especially civil service reform in the administration. Republican divisions and the desertion from the party's ranks of many who were dissatisfied with Mr. Blaine, the Republican candidate, aided the Democrats. But the Senate remained Republican throughout Cleveland's administration, and prevented Democratic legislation. In December, 1887, however, President Cleveland sent a message to Congress strongly advocating tariff reform in the direction of a tariff for revenue only. This made the issue for the coming Presidential campaign and encouraged the House at once to prepare and pass the so-called Mills Bill, a measure providing for greatly reduced customs duties. The campaign of 1888 was fought between Cleveland and Harrison, the Republican nominee, upon this tariff issue. The Republicans in their platform had advocated a high-protection policy. General Harrison was elected and served one term, till defeated in the election of 1892 by Cleveland, who was for the third time a candidate. The business depression which existed caused the President to call an extra session of Congress, which, notwithstanding the opposition of the silver men, repealed the purchasing clause of the Sherman Act, October 30, 1893. A tariff bill was now framed in the House under the charge of William L. Wilson, of West Virginia. This so-called Wilson Bill made free much raw material and reduced the duty greatly on finished products. The bill was presented to the House in December, but it was not till the third of the next July that it passed the Senate. It had, however, been so greatly amended by the conservative element in the Senate in the direction of protection that President Cleveland allowed it to become law without his signature. The depression in business still continued, and in consequence of this and of the tariff legislation the Democrats were badly defeated in the elections of 1894, and a large Republican majority was returned to the House of Representatives. Into Mr. Cleveland's foreign policy in the matter of Hawaii and Venezuela it is not possible to enter here. In regard to his financial policy he may be said to have steadfastly opposed the free silver men of his party, and to have favored a gold monometallism. His views are those of the bankers and capitalists of his party rather than of the Free Silver Dem-

Situation.**

ocrats who proved themselves at the Chicago Convention of 1896 to be in the large majority in the party. (See SILVER.) How genuine is the commitment of the Democratic Party to the Chicago platform some question, considering it only a matter of wire-pulling, but most consider the party to have entered at Chicago upon a new epoch, committed to the battle against a moneyed aristocracy as never before, and as notably expressed in the speeches of its gallant leader, Mr. Bryan. Some think that the party will tend toward a real though perhaps an unavowed socialism. Others hold that its fundamental principles unalterably commit it to individualism, to less government rather than to more, and thus opposed to any measures looking toward socialism. It remains to be seen how far it will be affected by those popular movements of reform which are daily growing more important and significant. For the platform of the Democratic Party in 1896, see Appendix.

DEMONETIZATION. See MONEY, also CONTRACTION AND EXPANSION OF CURRENCY.

DEMOREST, W. JENNINGS, was born June 10, 1822, in the city of New York, and received most of his education in the public schools. At 20 years of age he commenced his business career in the dry goods trade. In 1860 he entered the editorial and publishing business, and soon after that began the publication of the New York *Illustrated News* in English and German, and also *Young America*. In 1864 these were merged into the present *Demorest's Family Magazine*. Mr. Demorest traveled extensively and wrote largely on his favorite themes of ethics, especially against the evils of the liquor traffic. He distributed nearly 50,000,000 pages of tracts on this question.

Mr. Demorest was active in the great Washington movement, and was one of the originators of the Sons of Temperance. To test the question of the constitutionality of slavery he had a suit instituted and well on its way toward the Supreme Court when President Lincoln's emancipation proclamation was issued. He was an ardent supporter of Fremont's candidacy, and with Horace Greeley was on the committee which urged his second nomination. Altho for a long series of years he was associated as an equal partner in one of the largest printing houses in America, Mr. Demorest was interested in many other enterprises, and received numerous medals and diplomas for his inventions. He opened the first store on Fourteenth Street, New York.

Actively identified with the Prohibition Party, Mr. Demorest, since 1884, was a tireless worker for its success. He established the National Prohibition Bureau for speakers and the distribution of literature, and, true to his early convictions, organized the National Constitutional League, through which he was pressing a test suit up to the Supreme Court to establish the unconstitutionality of license to the liquor traffic, when his death occurred, April 9, 1895. He pub-

lished a monthly periodical called *The Constitution*. He served the party as a candidate for Mayor of New York City and for Lieutenant-Governor of the State. An interesting feature of Mr. Demorest's services for the cause of prohibition is the medal contest work for the education of the youth and the creation of public sentiment in favor of the universal prohibition of the liquor traffic.

DENISON, EDWARD, born at Salisbury in 1840, was the son of Edward Denison, Bishop of Salisbury. Graduated at Eton and Christ Church, Oxford; from 1862-66 he read law, in the spring of 1864 traveling through Southern Europe and Northern Africa. He became deeply interested in the condition of the poor, and in 1867 took a lodging among the tenements in Philpot Street, Mile End Road, East London. He resided here eight months, studying the conditions of life, building, endowing, and teaching in a school. He was one of the original members of the Society for Organizing Charitable Relief and Repressing Mendicancy in 1869, out of which has grown the Charity Organization Movement (*q.v.*). He disbelieved in giving doles, and in 1868 went to Paris and Edinburgh to study the working of the Poor Law. In November of that year he was returned (a Liberal) to Parliament for Newark, but his failing health prevented his continued attendance, and after vainly seeking improved health in the Channel Islands, he went on a voyage to Australia, but died in Melbourne January 26, 1870, two weeks after his arrival. His letters and writings have been published, London, 1870.

DENMARK AND SOCIAL REFORM.—Denmark was first an elective monarchy. In 1660, however, the crown was made hereditary. Her present constitution dates substantially from 1849. The executive power is in the hands of the king and his ministers, the legislative power in the Rigsdag, acting in conjunction with the king. The Rigsdag is composed of a Lands-thing, with 66 members, 12 nominated for life by the Crown, and the others elected by the larger taxpayers, and a Folkething of 102 members, elected for three years by universal suffrage. All members are paid \$1.50 per day and traveling expenses.

The population of Denmark (1890), 2,185,335 on an area of 15,289 square miles, gives it a density of 143 per square mile. Copenhagen, the capital, has a population of 312,859. The established religion is Lutheran, and the population almost purely Scandinavian. Education is widely extended, and since 1814 has been compulsory. The public schools, maintained by communal rates, are free to those whose parents cannot pay. The revenue for 1894 was 58,075,266 kroner, and the expenditure, 62,152,474 kroner (a krone = 25 cents). The national debt was 182,108,483 kroner, accumulated in part by deficits, in part for railways and harbor defenses. In 1893, 999 English miles of the total 1292 in the empire belonged to the State. The telegraph and post are in the hands of the State. The soil of Den-

mark is greatly subdivided, largely due to the law. The leading crops are oats, barley, rye, wheat, potatoes, and hay. For 1893 Denmark's imports were 320,294,907 kroner, and exports, 235,115,937 kroner. The exports, mainly to England, consisted largely of pork, butter, eggs, lard, animals, and cereals. December 31, 1893, Denmark and her colonies (Iceland, Greenland, West Indies) possessed 3675 vessels, of which 374 were steamers.

Agriculture and fishing are the main industries. Wages are low, and agriculture on the small holdings is very precarious. According to the report on Denmark of the (English) Royal Commission on Labor, 1894, the average annual wages on farms are 224 kroner, with board, and 371 kroner without. Weekly wages for piece-work in Copenhagen averaged for journeymen, 2268 ore and for women 1008 ore. The maintenance of a single man in Copenhagen is said to cost 770 kroner, and of a man and wife 996 kroner. Hours of labor are about 12, with one or two for meals. There is no legal limitation for adult hours; but since 1873 all factories have been supervised, and by various bills hours for children under 14 are limited to 6½; under 13, to 10. Under 10 they cannot work at all. The employment of children seems on the increase. Employees' liability laws have been much agitated, but little has been done. In old age pensions Denmark has gone farther than most countries. (See OLD AGE PENSIONS.)

Industrial Conditions.

Trade-unions in Denmark owe their origin to the socialist movement of 1871, tho as early as 1860 Herr C. V. Rimestad started a workman's union for education. This movement was developed by Pastor Sonne, of North Jutland, who started the first cooperative society in 1866. In 1874 there were 92 unions in connection with this movement, and a paper, the *Arbeiderin*. Cooperation, however, has had little success. Loan banks have been established, and there were in 1890,220 cooperative dairies. The trade-unions numbered 400, with a membership of some 35,000, about 20,000 of them being in Copenhagen. They are federated in one organization. Most of them are socialistic.

Labor Movement.

Socialism entered Denmark in 1870 in connection with the International (*g.v.*), under the lead of Louis Pio and Paul Geleff. A paper was started, and by 1872 the International counted 8000 members in Denmark. Strikes were inaugurated; but in 1872 the movement was suppressed by the police and the leaders imprisoned. Socialism did not appear again in strength till 1880, when it developed in the German type. There are to-day several socialist papers. The *Social Demokraten*, of Copenhagen, a daily, claims a circulation of 26,000. At the Copenhagen Congress in 1892 there were 104 delegates, and the party reported to the Zurich Socialist Congress of 1893 no less than 35,000 paying members. Socialist club-houses exist in most of the cities.

DENSITY OF POPULATION. See CITY, Sec. III.; POPULATION.

DEPARTMENTS OF THE UNITED STATES GOVERNMENT.—The Constitution gives the President authority to "require the opinion in writing of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices."

This presupposes that executive departments will be established in order that the various and multiform duties which pertain to the several divisions of the executive work of the national Government shall be systematically and efficiently attended to.

The various executive departments have been established by law. These are now eight in number: 1. The Department of State; 2. The Department of the Treasury; 3. The Department of War; 4. The Department of the Navy; 5. The Department of the Post-Office; 6. The Department of the Interior; 7. The Department of Justice; 8. The Department of Agriculture.

The heads of these eight departments constitute the President's Cabinet. Their official titles are as follows: 1. The Secretary of State; 2. The Secretary of the Treasury; 3. The Secretary of War; 4. The Secretary of the Navy; 5. The Postmaster-General; 6. The Secretary of the Interior; 7. The Attorney-General; 8. The Secretary of Agriculture.

For the efficient management of the business, several of these departments are subdivided into bureaus.

All the heads of departments are appointed by the President, by and with the advice and consent of the Senate. The salaries of these officers are \$8000 a year each.

The Department of State.—This was originally styled the Department of Foreign Affairs. The name was soon changed to the Department of State. The Secretary of State is generally considered as the highest officer in rank of the executive departments under the President. It is his duty to keep the seal of the United States, and to affix it to all commissions issued by the President. He issues all proclamations in the name of the President, and furnishes copies of papers and records of his office when required.

He keeps the correspondence with foreign powers, and it is his special province, also, to preserve the original of all laws, public documents, and treaties with foreign powers. It is also his duty to conduct the correspondence with our ministers and consuls to other countries, with foreign ministers accredited to our Government, and to him is confided the general charge of our foreign relations. He issues passports to our citizens visiting foreign countries, and it is his duty to issue warrants for the extradition of criminals to be delivered up to foreign governments.

The Department of State has a diplomatic bureau, consular bureau, and a domestic bureau.

Public Ministers and Consuls.—All persons who are sent abroad to represent our Government are connected with the Department of State.

The different ranks of our ministers are as follows: 1. Ambassadors; 2. Envoys Extraor-

dinary and Ministers Plenipotentiary; 3. Ministers Resident; 4. *Chargés d'Affaires*; 5. Secretaries of Legation.

The Secretary of Legation is the clerk to the foreign embassy. Consuls are not diplomatic agents of our Government, but commercial agents residing abroad, whose duty it is to watch over the interests of our commerce and our citizens, in the ports of the different countries. It is their duty also to protect the rights of our seamen. We have at the present time, in foreign ports, 20 or 25 consuls-general and commercial agents.

The Treasury Department.—Of late years the importance of this department has greatly increased. During the Civil War the Government issued bank bills termed greenbacks, and established a system of national banks, which have increased materially the number of officers and employees in this department. Under the Secretary of the Treasury are the following officers: 1. The Comptroller; 2. Auditor; 3. Treasurer; 4. Register; 5. Assistant Secretary.

This department has charge of the management of the revenue, superintends its collection, and grants warrants for money to be issued from the treasury, in pursuance of appropriations made by law, and generally performs all needful services relative to the finances of our country. There are various bureaus in the Treasury Department, as: 1. The Bureau of the First Comptroller; 2. The Bureau of the Second Comptroller; 3. The Bureau of the First Auditor; 4. The Bureau of the Second Auditor; 5. The Bureau of the Third Auditor; 6. The Bureau of the Fourth Auditor; 7. The Bureau of the Fifth Auditor; 8. The Bureau of the Sixth Auditor; 9. Treasurer; 10. Register; 11. Commissioner of Customs; 12. Comptroller of Currency; 13. Commissioner of Internal Revenue; 14. Bureau of Statistics; 15. The Mint; 16. Bureau of Engraving and Printing.

The Office of the Coast Survey is connected with the Treasury Department. This office prepares charts from actual surveys of the seacoast of the United States.

The surveys of the Great Lakes are under the control of the War Department.

The lighthouses of the United States were formerly under the control of the Treasury Department, but since 1852 this branch has been committed to the Lighthouse Board of the United States.

This Board consists of three officers of the army, three of the navy, and two civilians noted for their scientific attainments, with the Secretary of the Treasury President of the Board *ex officio*. This Board has in charge more than 1000 lighthouses, besides light vessels, beacons, and buoys innumerable.

Under this department also is the Supervising Architect, who has general charge of the plans and the construction of all United States buildings, such as custom-houses, court-houses, post-offices, etc.

The War Department.—This department has various subdivisions, as follows: 1. The Office of the Adjutant-General; 2. The Office of the Quartermaster-General; 3. The Office of the Commissary-General; 4. The Office of the Postmaster-General; 5. The Office of the Chief

of Engineers; 6. The Ordnance Office; 7. The Signal Office; 8. The Bureau of Military Justice.

These several divisions will be understood from their titles. The Bureau of Military Justice is in charge of an officer with the rank of a Brigadier-General, called a Judge-Advocate-General.

The War Department has the supervision of the United States Military Academy at West Point. This school for the education of officers for the army was established by the Government in 1802. In 1886 the number of cadets authorized by Congress was 344.

The Department of the Navy.—By an act of Congress, passed in 1862, eight bureaus were established in the Navy Department, as follows: 1. The Bureau of Yards and Docks; 2. The Bureau of Equipment and Recruiting; 3. The Bureau of Navigation; 4. The Bureau of Ordnance; 5. The Bureau of Medicine and Surgery; 6. The Bureau of Provisions and Clothing; 7. The Bureau of Steam Engineering; 8. The Bureau of Construction and Repairs.

The Government maintains a naval academy, which is established at Annapolis, similar to the military academy at West Point.

The Department of the Interior.—This department was not established until 1849. Under it are the Patent Office, Pension Office, the Land Office, the Bureau of Indian Affairs, the Science Bureau, and the Bureau of Education.

The Land Office.—The chief officer of this bureau is styled the Commissioner of the General Land Office. Under the Commissioner are the following officers: 1. Surveyors-General; 2. Registers of Land Offices; 3. Receivers of Land Offices.

The Post-Office Department.—Probably this is the oldest department under our Government. (See POSTAL SYSTEM.)

The Department of Justice.—The office of Attorney-General was created by the first Congress in 1789, but the Department of Justice was not established until 1870. This officer, however, has always been recognized as a member of the Cabinet. Under the Attorney-General are: The Solicitor-General, four Assistant Attorneys-Generals, a Solicitor of Internal Revenue, a Naval Solicitor, an Examiner of Claims, a Solicitor of the Treasury, and an Assistant Solicitor.

All of these officers are appointed by the President and Senate. Besides these officers, in this department are employed many persons as clerks, copyists, etc.

Department of Agriculture.—In February, 1889, the Bureau of Agriculture, heretofore in the Department of the Interior, was by an act of Congress made a separate department, the chief officer of which is the Secretary of Agriculture, who is a member of the Cabinet.

WILLIAM A. MOWRY.

(See *Studies in Civil Government*, from which, by permission, this is abridged.)

DEPENDENT CHILDREN.—The number of children in the United States dependent upon the community for support, according to Mr. Hart, of the Minnesota State Board of Charities and Corrections, as quoted by Professor

Warner (*American Charities*, p. 202), is 74,000, employing 9000 to care for them, at an annual expenditure of \$9,500,000. To these figures should be added the 14,846 inmates in juvenile reformatories (*q.v.*), and an expenditure of \$2,000,000 per year for maintaining these. The earliest form of caring for infants deprived of or deserted by their parents was probably the founding hospitals started by the Christian Church about the seventh century. For an account of these, see **FOUNDLING HOSPITALS**. They are still to be found in most large cities, often under the conduct of Sisters of Charity. A method far more generally approved to-day by State boards of charity is boarding the children out in good homes willing to take them. In Massachusetts about \$10 a month is paid for boarding an infant, clothing being furnished by the officials, the families being kept under strict supervision by the Board. The effort is being made more and more to keep the mother with the child. Says Professor Warner (*American Charities*, p. 212):

"Experiments in the cities of Boston and Philadelphia have shown that suitable service places in the country can be found to which destitute mothers may go, taking their children with them. 'The demand for this class of help usually exceeds the supply,' and in Philadelphia between 400 and 500 mothers with their children are yearly sent to situations in the country. If judiciously placed, a majority of these women give satisfaction to their employers, and are satisfied themselves. It is said that they do as well as those who take situations without children, and in many instances they are more reliable for help in the country. Of course a destitute woman with no one to help her support her child has not an easy life before her; but, on the whole, life will be happier and healthier in every way if she is aided in keeping her child than if she is aided in getting rid of it.

"Children over two years of age live quite persistently. Therefore, as regards these, we do not need to examine so closely the death-rate, for they may be very improperly cared for and the death-rate still be low. The first question of importance regarding them is upon what terms they shall be received and supported as dependents. . . .

"Perhaps the rule of the Children's Home of Cincinnati, which refuses to receive a child for more than two weeks without having the guardianship of the child vested in the Home, affords as much latitude as ought to be given. It is urged that parents are, after all, the best guardians of their children, and if the time ever comes when they can take care of their own it is better that the children be returned. But experience

shows that it has a bad effect on parents as parents to get rid of the care of their children for a time, and that they spoil the life of a child by selfishly taking it home when they think it is old enough to be of service. Parents who cannot support their children usually have not the capacity required to bring up a child in a healthful way and in a healthful environment. Besides this, the privilege of temporarily disposing of a child is frequently the means of bringing about its permanent abandonment. As affection wanes in consequence of absence, parents that would have found some way to support their children rather than give them up in the first instance gradually accustom themselves to the idea of abandoning their offspring.

"A stock instance of the effect of removing children from institutions to families, with the result that the natural parents will lose sight of and title to them, is that of the Union Temporary Home in Philadelphia. After 31 years of work, it was decided to close the Home and put the children out to board. Out of 70 children, the parents of all but nine were able to take good care of them themselves, and of the rest three found a way before final arrangements were found. . . .

"In 1874 Michigan established a State Public School at Coldwater, and provided, first, that children adjudged dependent should be sent there, and subsequently placed in private families as soon as possible; second, that after an order is made to commit a child to the State Public School, 'the parents of said child

shall be released from all parental duties toward and responsibility for such child, and shall thereafter have no right over or to the custody, services, or earnings of such child, except in cases where the said Board has, as herein provided for, restored the child to its parents.' The result of this system in Michigan has been that, whereas in 1874, she had 600 dependent children supported by public authorities, or one dependent child for each 2223 inhabitants, she now has 300, or one in each 7256 inhabitants. While the population increased 60 per cent., the number of dependent children decreased 50 per cent. Not only is this true, but the children that have passed under her care to December 31, 1892 (3,317), have been well cared for, and, as a rule, restored to the normal population of the State.

"New York took a different course. In 1875 she passed the so-called 'Children's Law,' which forbade the keeping of children between the ages of two and 16 years in the almshouses. It further provided that a dependent child should be committed, if possible, to an institution controlled by the same religious faith as that of its parents, and that the county should pay the child's board. The legal guardianship of the child was not mentioned, and so remained with the parents, if it had any. In addition to this, special acts were subsequently passed enabling certain large institutions in New York City to receive children at will, and collect from the county two dollars per week for the care of each. It only remains to contrast present conditions in New York with those in Michigan. On October 31, 1892, there were in the city and county almshouses of the State of New York 963 children, many of these, however, being crippled, diseased, or under two years of age. Besides this, there were in the private institutions of the State, but supported chiefly by the cities and counties, an army of 24,074 children. In these private institutions alone there was one dependent child to each 270 persons in the State. If we include the almshouse children, the proportion of dependent children to the population is one to 260."

After the child's reception, the next important problem is the right classification, to separate any who are distinctly wanting in vigor of body or mind, those who are delinquent or unmanageable, etc.

Then comes the important question of the method of treatment. Concerning this, Professor Warner says:

"Broadly speaking, there are two systems: the first is the institution plan, and the second is the plan of placing out.

"Without the figures of the Eleventh Census at hand, it is impossible to tell how large a proportion of the dependent children of the country is in institutions; but it is a comparatively large number. To build institutions for children has been the common and obvious thing to do in providing for them. The institution is preferred by parents, because they know where the child is, and can usually visit it, and frequently can retain the right to take it back again when they will. Institutions are also in favor with the benevolent, because the work done is so manifest. A hundred or more children, prepared for the occasion, make an attractive sight to the board of directors or to visitors. . . .

"On the whole, institutions are preferred by the children themselves, at least after they have been in them for some time. They do not feel at home outside of the sheltering walls, and shrink from the rough contact of ordinary life. . . . The children receive many negative benefits. **Institutions.** They are not cold, nor dirty, nor neglected, nor hungry, nor abused—that is, if the management is good. The grosser forms of profanity and vice can be restrained; their attendance on school exercises is entirely regular, as are also their hours of sleep and eating. But admitting these advantages, we have said about all that is favorable to institution life for children. The congregating of them together, which we found in the case of infants to result in high mortality, results in the case of older children in a low vitality.

"The fundamental fault is, perhaps, that life is made too easy. A child ought to have more opportunities of hurting himself, or getting dirty, or being insubordinate, than can possibly be accorded to him here. It is a pitiful sight to see a hundred children together, and none of them making a fuss. The discipline that would make a good soldier ruins a child. It is fatal to him to march in platoons, to play only at the word of command. As a matron in South Australia says, 'They

Children Received.

[the children] never grow up properly if you have a lot of them together. I would never have children of two or three years of age there; for if they get into an institution they never develop into anything: they only grow up into half-idiotic men and women. However good a nurse you have, she cannot draw out the intelligence of every child, and nurse it as it would be nursed in a home. . . . We have only five now, and they are as bright again as when we had 20. . . .

"A great part of the evils of institution life comes from the mingling of individuals, none of whom have a very good heredity behind them, and some of whom have inherited weak constitutions and bad moral tendencies. It is a continual fight on the part of matrons to repress skin diseases and sore eyes; and these contagious diseases are but typical of the contagious vices which are not so obvious, but more to be dreaded. That institution life is partly faulty because of the low grade of children who are received, and who bring about degeneration in each other, is proved by the experience of institutions that have introduced an element of artificial selection, which separates the low from the more highly organized. . . .

"Over against the institution plan of caring for dependent children is the plan of placing them in private families, with or without the payment of board.

Placing-out Plan.

There are two tolerably distinct methods of procedure in this work. By one, the children are sent to a great distance, and given but little subsequent supervision—that is the so-called 'emigration plan'; and by the other they are placed within easy reach of the agency

having them in charge, and subsequent supervision is systematic and constant.

"In London a large number of children are sent to the colonies. The emigration bureau operated in connection with Dr. Bernardo's homes sends about 500 children per year to Canada; and some of these, no doubt, find their way to the United States. The plan is to drop the child amid new surroundings, as carefully as is conveniently possible, and then to keep only so much track of him as is necessary to show to contributors or others that a goodly proportion of cases turn out well. The child is simply given one more chance to sink or swim. . . .

"Placing-out as a speciality has been carried to its most satisfactory results by such public institutions as the State Board of Lunacy and Charity in Massachusetts, and the State School for Dependent Children at Coldwater, Mich., and by such private associations as the Children's Aid Society of Massachusetts, and the Children's Aid Society of Pennsylvania. With these agencies 'the setting of the solitary in families' is a business. The following description, taken not literally, but in substance, from Mr. Folks's article on *Child-Saving Work in Pennsylvania*,* will give the best idea of how this system operates. The Children's Aid Society of Pennsylvania consists of a central society, with county committees in each county of the State, or in as many of them as efficient committees can be maintained, who have received from the directors of the poor or others dependent children, whom they place at once in families. Usually they are placed in the county where they become dependent; but when the children are particularly troublesome, or relatives interfere, or the family name is unfavorably known in the locality, the main office often removes the child to a distant part of the State. A large proportion of the children are placed in Pennsylvania, but a considerable number also in adjoining States. The work of the main office is conducted under the supervision of the managers by a corps of eight salaried officials, two of whom are men. One assistant gives her whole time to the problem of homeless mothers with young children, providing for them service places to which they can take their children. Four workers are traveling almost constantly, investigating families who have applied for children, visiting children who have been placed out, or taking children to and from their homes. Having relied so largely upon the family plan, the society has given much attention to the elaboration of the details of its administration, and has thrown around it every possible safeguard. Its investigation of a family is systematic and exhaustive, and is carefully recorded. The applicant fills out a blank containing 26 questions relating to the various phases of the family life, as church relations, distance from school, size of farm, occupation, number of members of family, with their ages, etc. A study of this return usually reveals the real motive of the applica-

tion, and gives the data for an opinion as to the material fitness of the family. Their moral fitness is ascertained by sending a list of questions to six of the neighbors, stating that their replies are confidential, and that the appeal to them is not known to the applicant. A personal visit completes the investigation. After the child is placed out, his welfare is ascertained and protected by from one to five personal and unannounced visits each year, by a monthly report from the teacher of the public schools, and a quarterly report from the pastor. The society uses neither indenture nor written agreement, the terms being perfectly flexible, and subject to change from year to year to suit the circumstances of each individual case. This society considers institutions for normal children needless, and has even had good success in boarding out juvenile delinquents received from the courts. A similar work has been done by the Massachusetts Children's Aid Society, which has one or two home-like institutions where abnormal children are placed until they can be fitted into a proper home."

Such, in brief, is Professor Warner's summary of the best thought of the world as to the care of dependent children under forms of civilization more or less individualistic. An interesting topic in connection with this is the treatment of children under socialism. Some socialists (confer Bebel's *Die Frau*), having argued that under socialism all children should be brought up by the community under proper conditions of hygiene and with a thorough and complete education, mental, moral, and physical, it has been said that this would so tend to relieve parents of responsibility that we should be met with all the evils of overpopulation. (See MALTHUSIANISM.) To this point Mill says (*Political Economy*, Book II., chap. i.):

"There would certainly be much ground for this apprehension if communism provided no motives to restraint equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description, this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of overpopulation, has the recommendation of tending in an especial degree to the prevention of that evil."

Children Under Socialism.

The problem, then, being reduced to proper proportions, it should be said that no socialists would compel parents to bring up their children in State institutions. Perfect freedom would be granted in this respect, provided it could not be proven that parents abused their children or failed to give them adequate education. Within these limitations all parents would be perfectly free to rear their children in their own way. Now, under socialism it is believed, by socialists at least, that all parents would be abundantly able to care for their own offspring. It is, therefore, to be expected that most parents would under socialism prefer to care for their own children, certainly until able to attend school. On the other hand, if parents able to care for their own should be so unnatural as to prefer to relinquish the care, it is doubtful if it were wise to leave children with such parents. Therefore only those would be reared by the

* *History of Child-Saving*, pp. 146, 147.

State who would not have favorable homes. Nor would there be any necessity for the State to rear the children in large institutions. The socialist state, like the present, could avail itself of all the experience which to-day places dependent children in separate homes and pays for them there. "DETROIT PLAN" FOR EMPLOYING THE UNEMPLOYED.—This was a plan proposed and carried out by Mayor Pingree (*q.v.*), of Detroit, for employing the unemployed in the hard times of 1894.

Mayor Pingree's proposition was that the idle land about the city should be used to furnish employment for the idle hands. A call was issued for offers of vacant lots to be used for market-gardening purposes. The response was liberal, several thousand acres being offered. The committee having charge of the project accepted, plowed and harrowed 430 acres (about 7000 city lots), and staked the land off in lots of from one quarter to one half an acre each. Three thousand persons applied for the opportunity to work, but the committee, from lack of funds, was able to provide for only 945 families. To these it furnished potatoes, beans, and other seeds sufficient for planting their plot, and supervised the work that was done, giving instruction to those who knew nothing about gardening. The committee's report upon the success of the experiment was extremely favorable. In brief, it read as follows:

"About nine tenths of the pieces were well taken care of. The committee estimates that the potato crop averaged about 15 bushels per lot, which would give 14,175 bushels of potatoes alone. Large quantities of beans, turnips, and other vegetables were raised and daily consumed, of which there is no record, the whole being sufficient to keep the people from want and habits of idleness. The estimated value of the crops produced was \$12,000 to \$14,000. The entire cost to the committee was about \$3,600. The committee finds that about one third an acre is sufficient land for a family to raise enough potatoes to last them through the winter and furnish vegetables through the summer. The loss by theft was practically nothing. The experiment has clearly demonstrated that many of the destitute are ready and willing to work, and that a large number of these people can be supported by utilizing vacant land on the outskirts of the city, and that the needy are thereby assisted without creating a demoralization in the habits of the people that gratuitous aid always entails."

The plan has been somewhat copied in other cities. (See **UNEMPLOYED**.)

DEWEY, DAVIS R., was born in Burlington, Vt., in 1858. He is an A.B., of the Univer-

sity of Vermont, graduating in 1879. He taught in Vermont and Chicago, 1879-83, and became a Fellow in Economics at Johns Hopkins in 1885, and Ph.D. in the same university in 1886. He then began instruction in economics and statistics at the Massachusetts Institute of Technology, Boston, and now holds a professorship there of those subjects. In 1886 he became the Secretary of the American Statistical Association, and under his direction the present series of the publications of that association was begun. In 1894 he was appointed Chairman of the Massachusetts Commission to Investigate the Subject of the Unemployed, and is one of the joint authors of the report published by that commission. (Boston, 1895. Part I., Relief Measures, pp. lviii., 200; Part II., Wayfarers and Tramps, pp. xxiii., 100; Part III., Public Works, pp. xiii., 122; Part IV., Causes, pp. lxiii., 24; Part V., Final Report, lxiii., 130). He has published short papers in the publications of the American Economic Association on *Street Railways, A Study of Statistics*, and *The Causes of Non-employment*. His main interest is in the subject of statistics, as evidenced in the editing of the publications of the American Statistical Association, referred to above, and in various reviews and articles in newspapers connected with that subject.

DICKENS, CHARLES.—We consider the English novelist here from the standpoint of social reform. Born at Landport, Hampshire, in 1812, and entering life as a parliamentary reporter and journalist, he early won that insight into life which enabled him to portray alike the sufferings and wrongs of the poor and the follies and shams of society. His *Pickwick Papers*, published in 1837, exhibited almost for the first time the life and manners of the lower, middle, and the working classes of London in this century. *Nicholas Nickleby*, his next effort, attacked the wrongs and cruelties inflicted upon the wretched pupils of the cheap schools in Yorkshire. *Hard Times* mocked the commercialism of the day; all his novels, such as *Old Curiosity Shop*, *Martin Chuzzlewit*, *Dombey and Son*, *Bleak House*, *Little Dorrit*, *Great Expectations*, *Oliver Twist*, and *David Copperfield*—perhaps his greatest work—have served the cause of social reform by picturing, tho ever with good nature, and always with an eye for the ludicrous, the sufferings and wrongs of the poor, the foibles and delusions of society. Visiting America twice and writing to the last, he died June 9, 1870.

DIKE, SAMUEL WARREN, was born in Thompson, Conn., on February 13, 1839; graduated at Williams College, where he took high rank as a scholar in 1863, and entered the Hartford Theological Seminary, then at East Windsor Hill; but after two years went to Andover, where he graduated with the Class of 1866. After a year and more of ill health, further study, and a few months' service in Pomfret, Conn., he went to West Randolph, Vt., in 1868, where he had an active ministry in the Congregational Church of about 10 years. In 1879 he removed to Royalton, where he was pastor nearly four years, and remained until 1887, when he

left Vermont and became a resident of Auburn-dale, Mass.

Mr. Dike devoted himself wholly to the ministry for many years, but was active in the social reforms of the town and afterward of the State, always carefully discriminating between ecclesiastical and civic functions. In 1872 he began writing occasional articles for the Vermont *Chronicle*, the State religious newspaper of the Congregationalists; and in 1877 wrote a series of editorials, taking the ground that wealth is to afford the great coming question of our country. They attracted considerable notice. Mr. Dike had long given much thought to the family and its problems, and in that year he became interested in the subject of divorce, entering into statistical research, and writing various articles on the subject. In 1881 he was asked to give one of the Monday lectures in Boston. In this lecture he took the ground that the divorce question is but a part of the larger problem of the family, and that this, in turn, is intimately related to the problems of property. That year a New England Divorce Reform League was organized, taking later the name of National League. Mr. Dike became its corresponding secretary. His study of Sir Henry S. Maine's works had led him to see the historical place of our present problems in the movement of the western civilization of the Aryans. This kind of treatment of the family naturally led into the broader fields of sociology. His more important articles have generally been devoted to the opening up of original work in some part of this broad field, while his official work in the League has kept practical measures in movement in investigation, education, and legislation. He has been a leader in securing the great report of the Commission of Labor on marriage and divorce, and in the establishment of State commissions on uniform legislation; he led too in what has been known from his series of articles in the *Andover Review* and elsewhere, as the Religious Problem of the County Town, having proposed and assisted in the widely known statistical investigation of Rev. Henry Fairbanks, in Vermont; he invented the Home Department of the Sunday-school, now extending over the country in many churches; he has helped introduce the study of scientific sociology in higher educational institutions, where he is a frequent lecturer. His sociological notes in the *Andover Review*, and his original methods of studying social structure and the problems of sociology, as well as his papers on the family, have attracted the attention of eminent scholars in this country and Europe. Mr. Dike is a member of the sociological group of fifteen whose papers appeared in the *Century*. He received the degree of Doctor of Laws in 1888 from Williams College. (See NATIONAL DIVORCE REFORM LEAGUE.)

DIMINISHING RETURN, LAW OF.—Says Professor Marshall (*Economics of Industry*, p. 21):

"The requisites of production may be classed as land, labor, and capital. We have now to seek for the law of fertility of land, the law of the increase of population, and the law of the growth of capital. The latter two laws depend on the first, which goes by the name of the law of diminishing return.

"We may explain the meaning of this name by an illustration. We shall presently see that the law does not apply to all new countries in which, tho the land is fertile, the population is very sparse. But let us suppose that in a certain district there are 20 agricultural laborers to the square mile, and that in the seasons in which they grow wheat they raise 2000 quarters, which is at the rate of 100 quarters per man. If now the population increases so that there are 30 agricultural laborers to the square mile, there will, of course, be an increase in the produce raised, but not a proportional increase. Perhaps the produce may now be 2600 quarters, so that the amount due to the labor of the additional 10 laborers is 600 quarters, which is at the rate of 60 quarters per man. Now let there be a further increase in the population, till there are 35 agricultural laborers to the square mile; there will again be an increase in the total produce raised, but again not a proportional increase. Perhaps the produce may now be 2850 quarters, so that the amount due to the labor of the last five laborers is 250 quarters, which is at the rate of 50 quarters per man.

"That increase in the amount of corn raised which is due to the labor of each additional laborer may be called the return due to his labor; and we may then say, that in this case the greater the number of men employed on the land, the less is the return which would be due to the labor of an additional man. This result illustrates the meaning of the law of diminishing return.

"But so far no account has been taken of the fact that the cultivation of land requires the farmer's capital as well as the laborer's toil. . . .

"The previous illustration represented the farmer as sending additional laborers into the farm, and then noticing the increase of produce due to their labor, or the return to their labor. We may now suppose that he increases by successive doses (a phrase used by James Mill to denote equal amounts of capital applied to land) the capital he applies to the land, and then notices the increase due to each successive dose, or, as we may say, *the return due to each dose.*"

The result, Mr. Marshall goes on to say, will be the same, a diminishing return; and he therefore thus states the law: "An increase in the amount of capital (or, to speak more generally, in the amount of effort) applied in the cultivation of land causes in general a less than proportionate increase in the produce raised."

The working of this law, however, may be modified by improvement in the art of agriculture, and by special circumstances of soils, especially in new countries.

Mr. Carey (*g.v.*) and a school of economists agreeing with him, and sometimes called the "American school," have taken up the second point:

"These economists argue that history shows that the best lands are not those which are cultivated first, but that the order of settlement of new countries is the passage from poorer to richer soil. The causes of this are various. Mountain districts have sometimes been selected on account of the means of defense which they offer against enemies; but more often the steep and self-draining mountain-sides were chosen because the low, rich lands, until they are drained, are infested by malarious fevers.

"In fact, if land is very rich, full of luxuriant undergrowth or marshy, it is not possible to cultivate it at all with only a small expenditure of capital and labor. But when the growth of population and the advance of civilization give the means of bringing such land under the plow, the return which it gives will abundantly repay the pains that have been spent on it. The tasks of draining marshy lands and freeing them from malaria, and of making roads and railways, are not easily performed when the population is thin and scattered. These writers have done good service in insisting on the fact that up to a certain point the greater the numbers in a country the greater will be the power of organizing labor and capital, and the greater, therefore, will be the return from land. It may be conceded to them that until this point is reached, land may be said to yield an increasing, not a diminishing return; and that, perhaps, more than half of the richest land in the globe is yet uncultivated.

"But this fact is not inconsistent with the law of diminishing return, which merely asserts that the re-

turn to capital applied to land diminishes, provided that there is already a dense and rapidly increasing population, and comparatively little improvement in the arts of cultivation."

Mr. Marshall, in the above-named book, goes on to apply the law to other questions, and says :

"The law of diminishing return is said to apply to mineral as well as to agricultural produce. This is not strictly true; at least there is a fundamental difference between the two cases. The richness of cultivated lands is likely to increase; so that if the demand for produce were to remain stationary, it could be satisfied with continually diminishing effort. But every mine is being impoverished by being worked. And when the richest mineral strata have all been discovered, the difficulty of satisfying the demand for mineral produce must increase, even if the demand should remain stationary. Improvements in the arts of mining may retard the operation of this law, but cannot entirely prevent it. . . .

"But the sternest application of the law of diminishing return is to space. An increased application of capital and labor will increase to some extent our supply of every other necessary; but it cannot increase at all the space afforded by one acre of ground, nor the sunlight and fresh air that is its natural endowment. The evils of overcrowding may be lessened by better drainage and better means of transport. But they still exist, and are a grievous hindrance to that growth of numbers and vigor which would otherwise be brought about by the increase of wealth and knowledge. London and other very large towns attract great numbers of the healthiest and most vigorous of the country population. They earn good wages; their children get abundant food and clothing; but they seldom have sufficient houseroom, scarcely ever any play that is really healthy and joyous, and never perfectly fresh air. So they grow up physically inferior to their parents; and their children in turn are inferior to them. The third generation of Londoners are with but few exceptions weaker and less healthy than the average of Englishmen; and yet their ancestors are the very pick of the race, whose offspring would under favorable circumstances have done much to raise the average quality of Englishmen.

"The law of diminishing return tells us that when population has reached a certain density, an additional amount of labor and capital will not raise a proportionately increased supply of food. The operation of this law is delayed by the progress of the arts of agriculture and manufacture, and by bringing fresh land under cultivation. It is possible that when the whole world is well cultivated, it may afford support for five or even ten times as many people as there are acres in the earth's surface. But a limit to the growth of population must be reached at last.

"The surface of the globe, including sea and land, is about 600,000,000,000 square yards. If we suppose that each yard allows standing room for four persons, this calculation gives room for 2,400,000,000,000 persons. Next, looking at the rate of increase of the population of England and Wales, we find that it doubled between the years 1801 and 1851. At this rate of increase population would in

100	years	multiply	itself	by	4
200	"	"	"	"	16
400	"	"	"	"	256
500	"	"	"	"	(1024, say) 1000
1000	"	"	"	"	1,000,000
2000	"	"	"	"	1,000,000,000,000,000
3000	"	"	"	"	1,000,000,000,000,000,000

"These facts show that sooner or later the growth of population must receive a check; but they do not show that it need be checked at present." (See POPULATION.)

DIRECT LEGISLATION is the direct and constant control of law-making by the people. In small communities it is obtained by the whole body of the citizens assembling in mass meeting to make the laws to govern themselves. This is done in the New England town meeting, which in local matters is the supreme legislative, executive, and judicial power, and which has been the method of country government in New England from its foundation, and from here has spread to many other parts of the United

States. It is seen in the ancient Teutonic *lands-gemeinde* still surviving in several of the Swiss mountain cantons. It is seen in almost all clubs, societies, and other organizations for various purposes.

In communities too large for the whole membership to assemble together for their own self-government, it is obtained by mandatory petitions and votings in two forms, called the Initiative and the Referendum. By the Referendum a law or bill must be held for a certain stated time—say 90 days—before it goes into effect. If during this time a certain per cent.—say 5 per cent.—of the voters sign a petition to have it referred to the people, it is held till the next election, when the people vote on it. A majority against prevents it from becoming a law. By the Initiative, if a certain per cent.—say 5 per cent.—of the voters sign a petition for a law, it goes to the law-making body, and there takes precedence of all other measures. They must vote on it. They can do what they please with it—pass, amend, reject, lay on the table. If they do not pass it, the Referendum takes effect on it, and at the next election the people vote on it. If a majority vote in favor of it, it becomes a law enacted by the people. These two things can be applied to local as well as to State and national law-making bodies.

The Referendum alone is negative, preventive; the Initiative, with the referendary voting, is positive, constructive. The Initiative is the impulse or creative movement; the Referendum is the deciding or will movement. They must be joined as man and wife. Both together make direct legislation.

These two elements, the Initiative and Referendum, we consider in detail under their respective heads (*q. v.*). We consider here the general principles that lie under both. These are the complete realization of democracy and the purification of politics.

Representation, it is claimed, does not represent for at least four reasons :

"1. Whole classes composing the bulk of the community are entirely unrepresented by men of their own class and condition, who are the only ones that can fully understand their wants and needs.

"2. Political parties are not properly represented, and other parties not at all. All we have is geographical representation, and tho that may have been useful a century ago, it is useless now because of changed conditions.

"3. From its very nature, representation can only roughly approximate the wishes of the community. Only a few great interests can be thus determined; where many issues are before the people it breaks down completely.

"4. Representation fails because of the weakness of human nature. The men elected often leave undone the things they were pledged to before election, and do the things they were not pledged to, and in many cases they do it because they have been bought."

In the Senate of the Fifty-third Congress 64, or over 70 per cent., of the 86 members are lawyers, 6 are bankers, 10 manufacturers or merchants, 1 a doctor, 1 a farmer, and 4 are classed as miscellaneous. In the House, with 346 members, 245, or over 70 per cent., are lawyers, 14 bankers, 21 manufacturers or merchants, 5 doctors, 25 farmers, 8 editors, and 28 miscellaneous. According to the census of 1880, out of 17,392,000 persons with occupations, 64,000 were lawyers, or .37 of 1 per cent., and yet they numbered over 70 per cent. of the legislators. Over 184

per cent. of the people are farm laborers, and 25½ per cent. are farmers and others engaged in agricultural work, making, with the laborers, 44 per cent., and they had 1 senator and 25 members in the House, or about 1 per cent. of the legislators. Domestic laborers number 6 per cent. and other laborers over 10 per cent. How are they represented? Perhaps in the miscellaneous? Nearly 10½ per cent. are engaged in trade and transportation. Where do they come in? The bankers number only 15,000, or .09 of 1 per cent., and they have one hundred times the representation they are entitled to in the 6 bankers in the Senate and the 14 in the House. While there are doubtless enough railway attorneys in both Houses to amply represent the .38 of 1 per cent. of railroad officials, where do the 236,000 railway employees come in? and the 204,000 draymen? and the 100,000 sailors? and the 381,000 clerks? and the 120,000 book-keepers and salesmen? These number over 7 per cent. of the population. Doubtless the 487,000 traders and the 44,000 manufacturers, numbering 3 per cent. of the population, are represented by the 10 manufacturers and merchants in the Senate and the 21 in the House. But how about the rest of those engaged in manufacturing? They are nearly 22 per cent. of our working population.

This is also true of our local legislatures. During the decade from 1880-90 the lawyers numbered nearly 60 per cent. of the Massachusetts legislatures. Of the 15 cities producing the largest values in manufactured products, Newark, N. J., has the largest proportion of wage-workers to population. Not one of her 11 representatives in the State legislatures of 1894 or 1895 is a wage-worker, and many of them are lawyers.

This is true of foreign law-making bodies. Four hundred and fifty thousand railroad shareholders in England have 22 members in Parliament, while 380,000 railroad employees have none. Eight hundred thousand agricultural laborers have 1, and the land-owners have 130 besides the House of Lords. One hundred and forty-eight lawyers are M.P.'s, and they are fewer in proportion to the population than in this country. Ship-owners have 25 representatives, and 220,000 seamen have 1. Coal-mine owners have 21, and 655,000 miners have 7. There are 15 mill-owners in Parliament and not one operative. Twenty-four ironmasters and not one worker. This is true of all law-making bodies. Classes are not represented.

One evil effect of the predominance of lawyer legislators is the vast amount of law turned out. Over 13,000 laws were passed in 1890 by the various State and the national legislatures. New Jersey alone passed 600 of these, and many of them were longer than the whole Justinian code. The lawyer, because of his training, uses a redundancy of words. Many laws are so complicated that a large share of the time of other lawyers hired by the State and called courts is required to explain them. We are almost submerged with laws; we need fewer and simpler laws. Many people feel that the sessions of the Legislature are an evil to be dreaded and curtailed as much as possible. This is shown by the growth of biennial ses-

sions. Over half of the State legislatures now meet only once in two years. Half of the law-making is thus saved.

Many of these legislators are noble, patriotic men. But the most pure-minded man cannot help being biased by his training, occupation, and associates. He will see his needs clearer than the needs of those in other walks of life. Belonging, as most of them do, to the "elevated classes," they do not see the needs of the workers. A representative body to be of the highest usefulness should represent all classes of the community, and this has proved under our system an impossibility. Under any system it would be at present an impossibility, as the lower classes do not yet know how to voice their needs and aspirations so as to embody them in law. Hence representation does not represent, because large classes of the community are entirely unrepresented in the law-making bodies.

2. Nor are political parties properly represented. If each party had been represented in the Fifty-third Congress in proportion to the number of votes cast for that party there would have been 153 Republicans instead of 127, 164 Democrats instead of 218, 31 Populists instead of 9, and 8 Prohibitionists instead of none. In the Fifty-fourth Congress there would be 165 Republicans instead of 248, 135 Democrats instead of 104, 44 Populists instead of 7, and 8 Prohibitionists instead of none. In the House of Assembly of New Jersey for 1894 there should be, if actual votes counted, 33 Republicans, 24 Democrats, 1 Populist, 1 Socialist-Labor, and 1 Prohibitionist; but instead there are 54 Republicans and 6 Democrats. In the Essex County delegation to the Trenton Legislature there should be 7 Republicans and 4 Democrats; but instead there are 11 Republicans. Representation does not to-day properly represent our political parties.

Representation does not Represent.

The introduction of religious and other issues into politics shows very plainly that it is impossible for representation to represent our religious parties and others.

Geographical representation is all our present system provides. A century and more ago this was a vital point. In one small local community there were few and unimportant class divisions. That locality was almost homogeneous. A man from it could represent it carrying with him to the central body its local flavor and getting its local wants. Other communities differed from it, and they had to have a representative of their own. But with the growth of our great systems of transportation and intercommunication there has come a churning up of our people. The local lines have been broken down, they have been made more homogeneous as a people. But the growth of great fortunes and the socialization of industries in huge factories has built up class divisions instead of the locality divisions, and geographical representation is to-day almost useless.

3. Representation does not represent because no one man can perfectly represent another. No two human beings are perfectly alike. Even if the best man is always elected, there are some

issues on which he does not represent many of those who voted for him. A thinking voter casts his vote for either of three reasons or some combination of these reasons. First, he thinks the platform of the party whose candidate he votes for suits him on the whole better than that of the other party, but there may be in it one or more planks that he is opposed to. Second, he uses the opinions or record of the candidate in the same way as under the first he used the platform. Third, he votes for the candidate because he believes in his honesty of purpose and ability. Yet that very honesty of purpose may lead the elected candidate to pass some measure to which the voter is much opposed. Even under the best conditions representation cannot perfectly represent.

But under present conditions the voter often has a choice of evils. The party machines, representing only the political wire-pullers, nominate; the ignorant voter is deluded by the shouting of party shibboleths; the enthusiastic voter is drawn in by torchlight parades and violent harangues; the corrupt voter is bought to do something that will be for his permanent disadvantage, and the intelligent voter is distracted by the multiplicity of issues and claims. Is it a wonder that wrong results? And after the election, an issue not made in the campaign, tho it may have been foreseen by the wire-pullers, comes up for the representative to vote on, and he decides it, tho unable to know how his constituency would have him vote. From its very nature representation cannot accurately follow the wishes of the people.

4. Representation does not represent because human nature is weak and the law-maker is bought either by money or by promise of power or place. Every thinking man can easily show where men have been definitely pledged to certain measures before election, and then have either done nothing or just the contrary. During the eighties the Republican Party was given the power to reform and gradually lower the tariff on direct pledges embodied in its platform and in the speeches of such leaders as Garfield, Blaine, Sherman, and others. In 1890 it went back on its pledges and passed the McKinley law, which raised the rates. The issue was clearly made between the two parties; it was the main issue, and on it the people gave the power to the Democratic Party in the election of 1890, and emphasized it by the election of 1892. No mandate from the people could be clearer. Yet the Democratic Party passed a law which their leader in the House, Mr. Wilson, said was a perfidy, and which Mr. Cleveland was ashamed to sign. There is no question here of the wisdom or otherwise of protection. The will of the people, as clearly expressed in the elections, was not carried out. The reason it was not carried out in both cases was the corruption by corporate interests of the representatives of the people.

Direct legislation, it is claimed, will remedy these ills. It will represent all the voters of all classes, and it will take away the main conditions of a corrupt legislature, because the legislators can then not make or unmake laws.

This is the system used in all deliberative bodies: A man rises and says, "I move so

and so," and after discussion, the body votes on it, the majority deciding. Under the Initiative, 5 per cent. of the voters rise and say, "We move so and so," and after discussion led by their representatives, all vote on it. Often a society refers a matter to a committee to examine and report, and after the committee has reported the body takes action approving or rejecting the report. This is the Referendum.

This is the principle by which all the fundamental laws and principles of our government are fixed. The people vote on all constitutions and amendments to constitutions. They are the final authority on the fundamental law of the land. If they are capable of fixing the great principles of government, they ought to be capable of deciding on the by-laws if they wish. The principle of direct legislation is entwined with the very foundation and framework of our whole system. Why should it not be extended to the minor details? The people have tried to do this by lengthening their constitutions and curtailing the powers of their law-making bodies. The Constitution of New Hampshire in 1776 had 600 words; the last Constitution of Missouri, passed in 1835, has 26,000 words, or 43 times as many as that of New Hampshire. This is a clumsy and inefficient way of getting at direct legislation for a few things. It is hobbling the feet of a horse to prevent his running away when it would be better to use the pair of reins of the Referendum and the Initiative. Often when the people want something badly they find they cannot get it because they have tied the feet of their horse.

The advantages are too many to even name fully here. It will remove corruption, because the legislator cannot be sure of delivering the goods. It will make the political discussion on measures and not on men, as at present, thus removing much of the mud-slinging so prevalent to-day. It will make it possible to introduce reforms just as fast as the people really wish. To-day in many cities the majority of citizens desire the municipalization of the natural monopolies (*q.v.*). The reforms cannot be carried, because the corporations, directly or indirectly, bribe the legislators to leave them in possession of franchises which bring them vast returns, and for which they give little or nothing, save just enough to buy the legislature. From legislatures as to-day constituted little or no reform can be expected. Direct legislation, it is claimed, is thus the key to all reforms to be gained by legislation.

Direct legislation has had a long and widespread trial, and has everywhere worked well. It is the principle of the old New England town meeting. It has existed in certain cantons of Switzerland from time immemorial. It exists to-day in **Experience.** Switzerland in modern form, and gives complete satisfaction. It has been used and is being more and more used in all our States for the adoption or rejection of constitutional revisions and amendments. It is adopted by the most advanced national labor unions, and for years was the only political or legislative demand of the American Federation of Labor.

For this history, however, and for exact methods for its adoption, see REFERENDUM; INITIATIVE.

Direct legislation appeals especially to Democratic Socialists. As socialism means brotherhood in economic and industrial life, so direct legislation is the logical fulfilment of and the final step in democracy, which means brotherhood and equality in political life. Socialism is democracy carried into economic life. Socialism cannot be carried out or even successfully attempted without the complete realization of democracy through direct legislation. If it is attempted without complete self-government in politics, it will result in a loss of independence and a new slavery more severe, more insidious, and more difficult to throw off, because the governing class will then, through corruption and through direct control, own the government, which owns all the means of production. The reformer will then have no fulcrum to put his lever on.

With direct legislation, the people will be educated in self-government; no industry will be taken over by any government, local, State, or national, till the people directly interested are persuaded that it is for their own interest to do it, and it will be taken over as soon as they are persuaded of this, and taken over without serious opposition as soon as the will of the people is known, because opposition will be useless.

Direct legislation in its adoption and fullest realization may thus be considered the final step in democracy and the first step toward a rational socialism. Yet it can be advocated on grounds entirely distinct from socialism, and many converts made among those who think they are directly opposed to socialism. So many reformers feel that it is the part of wisdom to concentrate attention on this first step. And the rapid yet sturdy growth of the movement in the United States is encouraging to its advocates.

There have been three attempts to form national direct legislation societies, but little has come of them. The movement has mainly worked through other organizations. One organization was commenced in 1892, with J. W. Sullivan as provisional president. At the conference of reform forces held in St. Louis, Mo., in December, 1893, a second organization was started, with Rev. James H. Lathrop, of Oberlin, Kan., as its provisional president. He has done and is doing a good deal of work in writing letters, but organization has not developed. The third was started at Vineland, N. J., in August, 1895, and is called the National Direct Legislation Reform Society, W. A. Daggatt, President; Rev. Adolph Roeder, Secretary; but it has never done more than a local work. Local societies have been much more active. Nevertheless, the main movement has been through the spread of its principles in other organizations.

ELTWEED POMEROY,

Editor Direct Legislation Record.

The principal objections raised to direct legislation are, first, that the real value of bills depends on their details, and that since these must be left to the legislators in any case, direct rep-

resentation will only give the people the form of power. Yet since nominally the people will have the power, corrupt legislators can so word bills as to appear to serve the public weal, tho really serving some private interest, and yet throw all the responsibility on the people. Again, it is claimed that people prefer to vote for men in whom they have confidence rather than for measures. In Switzerland, 20 referenda, from 1879-91, drew on the average only 58.5 per cent. of the votes. "The result of the small vote is that laws duly considered by the national legislature and passed by considerable majorities are often reversed by a minority of the voters." The recent vote on "right to employment" was rejected 4 to 1. In Ohio an amendment to tax franchises of corporations was lost three times because the constitutional 75 per cent. failed to vote.

It is claimed, also, that direct legislation will set the voters discussing some small details, while general principles will be neglected, and the result will be retrogressive rather than progressive. It is claimed by some that democracy (*q.v.*) is itself retrogressive. As to the claim that direct legislation will make it possible to get other reforms through unwilling legislatures, it is said that any legislature unwilling to pass real reforms would defeat direct legislation quite as much.

These objections, however, are not so much objections to direct legislation itself as reasons for not expecting too much. Especially in city governments every petty ordinance and bill cannot be referred to the people. If too many bills are so referred the people cannot give time to acting on each with intelligence. Representatives, therefore, must be trusted to pass some bills and draft all bills, and therefore must be carefully done and made responsible. The people, however, could and should vote on simple, large, well-defined measures, and to do so would in itself educate them for further power.

DIRECT TAXES. See TAXATION.

DISPENSARY LIQUOR SYSTEM. See SOUTH CAROLINA DISPENSARY SYSTEM.

DISTRIBUTION, in political economy, is that large and important part of the subject which studies the division of products among the independent individuals, or classes of individuals, who compose the society. As the elements that contribute to production are usually classed as labor, capital, and natural objects or agencies, the fundamental formula of distribution is usually expressed thus:

Produce = Rent + Interest + Wages, where,
Produce = the increase made in material wealth, the net produce that remains after any auxiliary capital that may have been consumed is replaced;
Rent = the total amount received annually for the use of natural objects and agencies;
Interest = the total amount received annually for the use of capital;
Wages = the total amount received annually in remuneration for labor of whatever kind.

In the above equation we include under "wages" the remuneration of employers for the work of organizing, and supervising the labor of others; we include under "interest" what is usually called rent, so far as it is paid for anything that has been produced by labor; and we limit the word "rent" altogether to payments made for the use of land and other gifts of nature.

It is greatly to be regretted that in this, and other instances, we are compelled to use words in other than their ordinary meaning; but where ordinary parlance confuses things fundamentally different, such as the "rent" of a house, and the "rent" of land, things which depend on altogether different laws, our only alternative would be to invent new terms, the signification of which it would be still more difficult to understand.

The difficulty is perhaps most serious in the case of the word "wages." If the word "profits" could be taken to express the earnings of employers for the labor which they undergo, our equation might be put into the form $\text{Produce} = \text{Rent} + \text{Interest} + \text{Profits} + \text{Wages}$. For some purposes this would be the most convenient form of the equation. But the word "profits" is almost invariably used to include interest on capital, as well as remuneration for employer's labor, and if so used, the second form of the equation would count twice over one portion of interest. The balance of advantage seems therefore in favor of the earlier form of the equation.

In reference to distribution in general two questions may be, and in economic science have been, more or less carefully asked: What is the share, and what in equity should be the share of these various elements? As each question, however, in regard to each element demands in itself a long discussion, each is entitled to a separate article, and will be considered under the respective subjects of Rent, Interest, Profit, Wages. Thus far in political economy the question mainly asked as to distribution has been: What share, as a matter of fact, can rent, interest, and wages get, where each element is competing to get all it can? This was to Adam Smith and his followers the main question, because, experiencing the evils of the unwise State interference of the day, they believed that the best state of affairs for the public was where there was no interference, but where every one was left free to secure whatever share in the distribution he could. Believing also that every one was best able to look out for his own interests, they held that it was for the general good for each one to do this. They asked what share under this condition each one could get, believing that in the long run this was also the right share for him to get. More recently and mainly beginning with Mill, men have asked more and more the ethical question, what share each should get. It has been seen that under the free play of private interests, persons monopolizing the ownership of natural agencies and opportunities, or abundant capital, were able to get a vastly larger share than those who had only their labor to dispose of. Men must live, and when they have only their labor to dispose of they must sell it day by day, as a rule, in order to earn a living. Those who have large capital or ownership of large natural opportunities to fall back upon, are, on the other hand, not compelled to sell until they can get good prices. Natural opportunities, again, cannot be indefinitely supplied, and can be and have become largely monopolized; whereas, under the process of life, the supply of labor is much more abundant, and therefore the limited supply of natural opportunities enables rent to rise, while the large supply of labor tends to make wages

fall; or, if other causes raise wages, to prevent wages from rising in proportion to rent. For these and other causes it is claimed by socialists and others that the free play of private interest between rich capitalists and landlords and poor laborers is not fair play, and not truly free play (since the capitalist and landlord are comparatively free, but the laborer is often the slave of his circumstances). Hence the question is rising more and more as to what should be the basis of division, and many proposals have been made. It is proposed that laborers combine to get a larger share. Hence we have Trade-Union, Knights of Labor, etc. It is proposed that capitalists and landlords give a larger proportion of the produce to the laborers than they are able to secure by mere private struggle. Hence we have proposals for profit-sharing and various charities. It is proposed that laborers combine to be their own capitalists and landlords; hence we have all sorts of cooperative and communistic experiments. It is asserted that the wealthy classes have so much power in their hands that private cooperation cannot succeed in competing against them, and hence it is proposed that all the people, through government (municipal, State, and national), secure all the means of production (capital and land, so far at least as land is used for production), and operate them collectively for the equitable good of all; the people thus being their own employers, capitalists, and landlords. Hence we have Municipalism, Nationalism, Socialism. It is claimed that capitalists and landlords have been able to secure, and are to-day able to maintain their large share in distribution, only through the favoritism of the government. Hence we have proposals for free trade, the single tax, or the freeing of competition after land has been removed from private appropriation, the extreme proposals of the very great minimizing of the State in individualism, or the abolition of government in anarchism. It will be thus seen how the large proportion of the social reforms proposed to-day are reforms either in distribution or proposed with the view of affecting distribution. Hence a large proportion of this volume may be said to be concerned with distribution, and for the various proposals the reader must look under the names given above.

It should be added that a few men, and some of them of great ability and even brilliancy, like Edward Atkinson, steadily refuse to recognize distribution as being a more important question to-day than formerly. They assert and undertake to prove that if labor to-day does not receive as large a share in distribution as it should, it is receiving at least a continually increasing share, and that the present so-called Labor Question is but the laborer striving for a still larger share because he has been lifted up to a plane of education and of conscious wants which he has never occupied till now. Hence they argue that all we have to do is to keep on in the operation of allowing the freest play to private interests, only aiming continually more and more at education in the broadest and deepest sense, and at increase and saving in production; so that there will be more to distribute. This position will be discussed under the articles WAGES and SOCIALISM. Whether this position

be right or not, however, the large majority of economists and workers for social reform believe that it is not the case, and that the problem of just distribution does press to-day as never before; their books, therefore, are filled with discussions of the various proposals to secure a juster distribution. It has been said that, comparatively speaking, economic thought has solved the problem of the production of wealth, and the question now is mainly how to distribute it. It should be added, however, that a growing number of socialists argue that our present distribution is unjust because growing out of methods of production radically unjust, and that, therefore, the need is for a thorough change in industrial methods, both as to production and distribution, and beginning with the former. (See *SOCIALISM*; *WEALTH*; *WAGES*, etc.)

DISTRIBUTIVE COOPERATION. See *COOPERATIVE DISTRIBUTION*.

DIVISION OF LABOR.—When a number of workmen are engaged in any work, we find that each man usually takes one part of the work and leaves other parts of the work to his mates. People by degrees arrange themselves into different trades, so that the whole work done in any place is divided into many employments or crafts. This is termed division of labor, and is found in all civilized countries, and more or less in all states of society, which are not merely barbarous.

Such a condition of affairs naturally has both great advantages and disadvantages. Adam Smith's classic statement of the advantages of division of labor has been added to, but hardly surpassed. He found them mainly three:

1. Increase of dexterity in every particular workman.
2. Saving of the time which is commonly lost in passing from one kind of work to another.
3. The invention of a great number of machines, which facilitate and abridge labor, and enable one man to do the work of many.

There can be no doubt as to the increase or dexterity which arises from practice. Any one who has tried to imitate a juggler, or to play the piano, without having learned to do it, knows how absurdly he **Advantages.** fails. Adam Smith states that if a blacksmith had to make nails without having been accustomed to the work, he would not make above 200 or 300 bad nails in a day. With practice he might learn to make 800 or 1000 nails in a day; but boys who are brought up to the nailer's trade can turn out 2300 nails of the same kind in the same time.

Secondly, division of labor saves time. Before one can make anything he must get the right tools and materials; when he has finished one box he is ready to make another with less trouble than the first; but if he must go off and do something quite different, such as to mend a pair of shoes or write a letter, a different set of implements has to be got ready. A man, as Adam Smith says, saunters a little in turning

his hand from one kind of employment to another.

In the third place, Smith asserted that the division of labor leads to the invention of machines which abridge labor, because men, he thought, were much more likely to discover easy methods of attaining an object when their whole attention is directed to that object. Workmen invent modes of lessening their labor, and important inventions have been made in this way. Division of labor also leads to invention, because it enables ingenious men to make invention their profession. The greatest inventors, such as James Watt, Fulton, Roberts, Nasmyth, Howe, Fairbairn, the Stephensons, Wheatstone, Bessemer, have cultivated an original genius by careful study and long practice in mechanical construction. The division of labor also greatly assists invention, because it enables each factory to adopt particular kinds of machinery. The division of labor is continually becoming more and more minute, and it is not uncommon to find that the whole supply of some commodity is furnished from a single manufactory, which can then afford to have a set of machines invented on purpose to produce this one commodity.

The economy of inventions is best attained when it is the business of a certain set of people to study every new invention which bears on their particular trade; for each new leading idea with regard both to processes and machinery has many practical applications. Knowledge is acquired in working out one invention that is likely to be of use in seeking for others. If, however, the work of thinking is confined to a few, division of labor is carried too far.

There are other advantages. A deal of labor is often saved by arranging work so that a laborer may serve many persons as easily as one. If a messenger is going to carry a letter to the post-office, he can as readily carry a score. Instead of twenty people each carrying their own letters, one messenger can do the whole work without more trouble. This explains why the post-office is able to forward a letter from any part of the country to the other for two cents. Multiplying of copies is another great gain made possible by division of labor.

When the proper tools and models for making a thing are once provided, it is sometimes possible to go on multiplying copies with little further trouble. To cut the dies for striking a medal or coin is a very slow and costly work; but when once good dies are finished, it is easy to strike a great many coins with them, and the cost of the striking is very small. The printing press, however, is the best case of multiplication of copies.

Almost all the common things we use now, such as ordinary chairs and tables, cups and saucers, teapots, spoons, and forks, etc., are made by machinery, and are copies of an original pattern.

A further advantage of the division of labor is that, when there are many different trades, every person can choose that trade for which he is best suited. Each man will generally work at the trade in which he can get the best wages, and it is an evident loss of skill if the artisan should break stones or sweep the streets. Now,

the greater the division of labor and the more extensive factories become, the better chance there is for finding an employment just suited to each person's powers; clever workmen do the work which no one else can do; they have unskilled laborers to help them in things which require no skill; foremen plan out the work and allot it to the artisans; clerks, who are quick at accounts, keep the books, and pay and receive money; the manager of the factory is an ingenious experienced man, who can give his whole attention to directing the work, to making good bargains, or to inventing improvements in the business. Every one is thus occupied in the way in which his labor will be most productive and useful to other people, and at the same time most profitable to himself.

Lastly, the division of labor allows of local adaptation—that is, it allows every kind of work to be done in the place most suitable for it. Each kind of labor should be carried on where it is most productive; but this cannot be done unless there be division of labor; so that while the French grow wine, weave silk, or make *articles de Paris*, they buy the cottons of Manchester or the coals of Newcastle. When trade is free and the division of labor is perfect, each town or district learns to make some commodity better than other places. In England watches are made in Clerkenwell; steel pens in Birmingham; needles at Redditch; cutlery at Sheffield; pottery at Stoke; ribbons at Coventry; glass at St. Helen's; straw bonnets at Luton, etc.

The localization of industry promotes the education of skill and taste and the diffusion of technical knowledge.

Where large masses of people are working at the same kind of trade, they educate one another. The skill and the taste required for their work are in the air, and children breathe them as they grow up. This is seen particularly in such manufactures as those of glass and pottery. Again, each man profits by the ideas of his neighbors; he is stimulated by contact with those who are interested in his own pursuit to make new experiments;

Division of Industries. and each successful invention, whether it be a new machine, a new process, or a new way of organizing the business, is likely when once started to spread and to be improved upon.

In a district in which an industry is localized a skilled workman is sure of finding work to suit him; a master can easily fill a vacancy among his foremen; and generally the economy of skill can be carried further than in an isolated factory, however large. Thus both large and small factories are benefited by the localization of industry and by the assistance of subsidiary trades. But these benefits are most important to the small factories, and free them from many of the disadvantages under which they would otherwise labor in competition with large factories.

Still a large factory has many special advantages.

Firstly, greater economies can be attained by a large than by a small factory in such matters as the arrangement of buildings, steam engines and other machinery; and again in such work

as that of clerks, doorkeepers, stokers, repairers of machines, etc. One high chimney can make a draft for a large furnace as well as for a small one; one doorkeeper can admit 500 men as easily as 50.

Again, a large factory can often afford to buy a machine to do work that is done by hand in a small factory. It is true that a small factory devoted to one short stage of the process of manufacture may have the best and most highly specialized machinery. But such a factory would not come into existence until the advantage of having special machinery for this stage had become well established.

Perhaps the greatest economic advantage of large factories is that they can buy in large quantities, and thus both get better prices and save in transportation.

Whatever may be the result of the contest between large and small factories, it appears certain that the division of labor will continually increase. This increase is one of vital importance. It adds to men's power over nature, and furthers social progress.

There are said to be about 36 distinct kinds of employment in making and putting together the parts of a piano; there are about 40 trades engaged in watch-making; in the cotton business there are more than 100 occupations. But new trades are frequently created, especially when any new discovery takes place; and thus, there are at least 16 different trades occupied in photography, or in making the things required by photographers; and railways have produced whole series of employments which did not exist fifty years ago. In the shoe trade, D. A. Wells states, in his *Recent Economic Changes*, that there are really 62 distinct mechanical employments.

But we must now notice the disadvantages of division of labor. These may not be so numerous, but they are of the utmost seriousness.

In the first place, division of labor tends to make a man's power narrow and restricted; he does one kind of work so constantly that he has no time to learn and practise other kinds of work. A man becomes, as it has been said, worth only the tenth part of a pin—that is, there are men who know only how to make, for instance, the head of a pin.

"Think," says Dr. Josiah Strong, "of making pin-heads 10 hours a day, every working day in the week for a year—20, 40, 50 years! A nailer . . . does his day's work by pressing into the jaws of an ever-ravenous machine a small bar of iron. . . . Think of making that movement for a lifetime. . . . It admits of little interest and no enthusiasm in one's work; and, worst of all, it cramps the mind and belittles the man. Once the man who made the nail could make the iron fence also; now he cannot even make the nail, but only feed a machine that makes it."

A second disadvantage of the division of labor is that trade becomes very complicated, and when deranged the results are ruinous to many. Each person learns to supply only a particular kind of goods, and if change of fashion or any other cause leads to a falling off in the demand for that kind of goods, the producer is left in poverty until he can learn another trade. At

one time the making of crinoline skirts for ladies was a large and profitable trade; now it has ceased almost entirely, and those who learned the business have had to seek other employments. But each trade is generally well supplied with hands perfectly trained to the work, and it is very difficult for fresh workmen, especially when old, to learn the new work, and com-

pete with those who have long practised it. Even if he be fortunate enough to get work, it is humiliating and exasperating to a workman who, at the cost of years of toil and application, has acquired skill, which has become a source of independence and honest pride, to find himself suddenly superseded by a machine and compelled at reduced wages to stand and guide its movements—a service which can as well be, and soon is, performed by a girl. But the laborer not only suffers pecuniarily; he is socially and morally degraded. Division of labor contracts the sphere of the laborer, renders him more and more dependent upon others, dwarfs him mentally, and thus degrades him.

Is it any wonder that labor protests? To adopt a system of compulsory education, which enlarges working men's ideas of liberty, equality, and manhood, and at the same time reduces them to industrial machines, will inevitably result in social disturbances. It is certain that the subdivision of labor cheapens production, and is therefore an economic principle which will prevail more and more in the development of industry.

It is equally and lamentably certain that little or nothing has been done to counteract its baleful effect upon the character of laborers. They cannot afford to become mere automatons at the expense of their manhood. Because machinery can go on forever, it is forgotten that flesh and blood cannot do the same.

There are disadvantages to the community generally apart from those that affect the laborer. When, under the division of labor, a whole town becomes dependent upon one industry, or one branch of one industry, the whole town becomes too dependent upon the condition of that industry. When it is flourishing the town is unhealthily "boomed;" when its industry declines it is "swamped." The discovery of a new method or the invention of a new machine may ruin a whole town or circle of towns. Men become not the masters, but the slaves of machines. They do not possess their tools, but are possessed by them.

Once, again, division of industry, by developing machine work and transforming the artisan into a tool, displaces handwork, and much of the freedom, and individuality, and beauty, and variety, and originality that makes medieval art work so attractive. It lowers esthetic as well as moral ideas. Machine work becomes the rule.

However, these disadvantages of the division of labor are not arguments for its disuse, but for its modification. Undoubtedly the lowering of a man into a tool is too high a price to pay for advantages in quantity and ease of production of material things; but the question is, whether we may not have the advantages with-

out the disadvantages. To this end various methods are proposed. The most important is perhaps the reduction of the hours of labor. (See EIGHT-HOUR MOVEMENT.) This, by reducing the hours when men should do their routine work, would give them increased opportunity to develop and broaden in other ways. Again, nationalists and socialists would so order society that every man should have the opportunity to labor, so that if demand for one kind of labor ceased he could be sure of being given work in another kind of labor. (See UNEMPLOYMENT.) To these should be added a reform in which all agree—the development of technical and industrial schools, where, if men choose specialties, they can also be broadened by study and development, to some extent at least, in other lines. All progressive thought is agreed that stern protest by word and deed must be made against the tendency to reduce the man to a tool.

Difficulties Met.

DIVORCE AND MARRIAGE REFORM.

—The movement for divorce reform in the United States is, on the whole, the best point from which to treat the general subject in this work. The condition of the divorce laws of Connecticut drew grave criticism from Rev. Benjamin Trumbull in the last century, and from the elder President Dwight, of Yale, a generation later. Then, in 1867, President Woolsey first published his able treatise in the form of articles for the *New Englander*, and afterward in a separate volume. Little immediately came of any of these discussions. But in 1877 fresh interest in the subject in Connecticut and Vermont, and afterward in Massachusetts, led to the organization of the New England Divorce Reform League in 1881, which, in 1885, became the National Divorce Reform League. Its corresponding secretary and most active officer is the Rev. Samuel W. Dike, LL.D., Auburndale, Mass. (*q.v.*) It does not, as a rule, propose definite measures of reform, but aims "to promote an improvement in public sentiment and legislation in the institution of the family, especially as affecting existing evils relating to marriage and divorce." It seeks to unite all, whatever their religious faith or their views on this particular subject may be, who are willing to cooperate in the general aim of the League. It holds the subjects of marriage and divorce to be so inseparably connected with each other, and through the family with the entire social order, that only in study and work broad as the wider relations of its special subjects can the best results be permanently secured. Scientific sociology, if one may so speak of it, is, therefore, a necessary part of its instrumentalities. Careful statistical inquiry is also largely used. Constructive work is held to be even more important than critical and restrictive. In nearly all if not all these methods the League has been foremost among social reforms, and owes much of its success to their adoption. The official investigation of marriage and divorce in the United States and Europe was proposed by its secretary, and was largely due to its efforts. The League has been

a leading agency in bringing the whole subject into its present prominence in the present hopeful movement for uniform legislation, and in the introduction of sociology as a study with the educational institutions of the United States. The entire range of these subjects has also been greatly increased. This treatment of divorce in the closest relation to the family was formerly rare.

The marriage laws of Europe have undergone a very great change within a century. The best account of this change, as it affects the celebration of marriage, which has been a movement rather than a reform, in the popular use of this latter word, is to be found in a series of papers by Frank Gaylord Cook in the *Atlantic Monthly* in 1888 and 1889, which unfortunately have not yet been put into book form. The other features of the change can best be studied in the report mentioned above, and in the books named in its bibliography and in others found in the libraries.

Europe.

The obligatory civil marriage with the optional religious celebration has come to prevail in the greater part of Europe. With this go careful provisions for the protection of the parties from fraudulent marriages; for the consent of parents; for the celebration of the marriage by some single official in each locality, or at most by a few; for the public record and preservation of the facts regarding the marriage, and in some countries for the record of all dissolutions of marriage from whatever cause. The reader may consult the official report for the chief points in the present imperial marriage law of Germany for a good example of a scientifically constructed marriage law, intended to cover every important point, and especially for the protection it gives against bigamous marriages. Of course, these systems in countries which readily accept close official inquiry and supervision in domestic affairs could hardly be transferred unchanged to the United States. Some of their safeguards, however, should be adopted by us. But caution should be exercised in regard to such features in them as restrictions upon marriage relating to property and other qualifications for a sound domestic life, because of the immoral relations which they often induce.

In our own country, following the lead of Massachusetts, most States now have a system of marriage license; many require some sort of return of the licenses to a local authority, but only 21 provide for returns to the central State authorities and their official publication. Annual divorce statistics are still less available in this country than those of marriage, for only eight or nine States provide for them. In Europe many countries carefully collect and publish statistics of marriage and divorce each year. These annual returns and the remarkable collection of the United States Report for the years 1867-86 taken from the original sources for all our States, Canada, and most European countries, are the sources of present statistics.

The United States.

No attempt is made here to give the chief points of the marriage laws of this country and Europe, both for the reason that space will not permit and because the excellent and convenient digest of the report of the Department of Labor at Washington, which can be obtained without cost, renders this unnecessary. The same remark applies to divorce laws. Students should always first consult this report. The vital statistics of the United States census, especially those of the census of 1890, and of the registration reports, notably those of Massachusetts, Michigan, and Great Britain in English, and those of Germany, France, etc., are exceedingly instructive on the movement of marriage and birth-rates. A few other States than those named also have very good reports. A paper by the writer of this article appeared in the proceedings of the International Statistical Institute for 1893, and in the publications of the American Statistical Association for December, 1893, on the *Condition and Needs of Statistics of Marriage and Divorce*. A work on divorce by Dr. Henri Morselli, of Italy, the distinguished authority on suicide and its causes, is in course of preparation.

The significance of the increase of divorce must be sought in its relation to the family and the social order generally rather than for its bearing on individual morality, tho its evils here

are serious indeed. Divorce is the legal dissolution of the relation of husband and wife, or, practically, of the family, before its termination by the natural cause in the death of one of the parties. The cases of divorce represent only those unhappy domestic relations where for any reason the parties are willing to seek the courts for relief, and actually get it in a decree of divorce. Two things should, therefore, be noted with care. The number of divorces in a given period are by no means equal to the number of families in which serious trouble or imperfect or vicious domestic conditions exist, for they only show the number of this greater class who prefer divorce to further endurance of real or imaginary troubles, and are willing to go to the courts for it. There is an unknown number of families from which the actual divorces come, in which adultery, desertion, cruelty, neglect, alienations, and lack of support exist. Then, on the other hand, the lessened hold of former convictions of the sacredness of marriage, the increase of those ideas which make it easier to assert rights, and the greater familiarity of the people with the thought and practice of divorce may operate in a way to increase the ratio of divorces to population beyond the increase of domestic evils. Yet with the decreasing birth-rate, especially among the classes who are the best able to rear children and yet are not physically incapacitated for the duties of parents; the deliberate practice of criminal abortion and its kindred vice among many; the increase of celibate life and the social vices of many of this class as well as of the married, and the tendency in certain quarters of society, even among women, to look upon marital infidelity with less abhorrence than formerly, the danger of an exaggerated opinion of the significance of the vast and growing volume of divorces in the United States is not very great. It is probably more than counterbalanced by the insensibility to the evils which mark large numbers, even of the better class of our people.

A few statistics, summaries in all instances from the report of Mr. Wright, Commissioner of Labor, or for years since 1886, from my own collections from official sources, and those of Australia from J. A. Coglean, Esq., Government Statistician of New South Wales, which Professor Willcox, of Cornell University, secured, will now be given in illustration of the general movement, and to bring out various facts regarding it.

For the two extreme years covered by Mr. Wright's report we have the following figures:

COUNTRY.	NUMBER OF DIVORCES.	
	1867.	1886.
Belgium.....	130	354
France.....	2,181	6,211
England and Wales.....	130	372
Scotland.....	32	96
Baden.....	19	143
Bavaria.....	270	238
Saxony.....	396	917
Württemberg.....	94	161
Hesse.....	28	53
Netherlands.....	133	418
Poland.....	163	345
Sweden.....	128	226
Switzerland*.....	190	396
United States.....	9,937	25,535

* Six cantons.

It should be said of France, that the figures given above for 1886 include both separations and the divorcés under the new law of 1884. In 1883, the separations were 3010. In 1887 the absolute divorces numbered 4685, and the divorces after separation for three years were 1112 or 5797 in all.

Other countries give the following: Canada had 4 divorces in 1868 and 9 in 1888; Denmark, 470 in 1871 and 577 in 1881; Ireland, 4 in 1871 and 7 in 1886; the German Empire, 5263 in 1882 and 8710 in 1889; Prussia, 2329 in 1881 and 3808 in 1886; Switzerland entered had 1102 in 1876, the first year under the Federal law, and 899 in 1886; Elsass-Lothringen, 56 in 1874 and 117 in 1886; Hamburg, 145 in 1880 and 287 in 1886; Italy, 723 in 1869 and 591 in 1890; Norway, 33 in 1870 and 71 in 1890; Roumania, 276 in 1871 and 432 in 1880; Finland, 55 in 1875 and 62 in 1886; Japan, 109,995 in 1884 and 109,988 in 1890, or about one third the marriages. Divorces and separations, it should be said, are combined in one total in the above. France granted separations only between 1816 and 1884, while Italy has always granted separations only. Russia gives the number of divorces reported from three of the religious bodies as follows: Orthodox Greek Church, 810 in 1886 and 1196 in 1885; Evangelical Augsburg Confusion, 147 in 1867 and 188 in 1886; Evangelical Reformed Confusion, 7 in 1867 and 1 in 1886.

In New South Wales divorces and separations increased from 9 in 1875 to 51 in 1890; in Victoria, from 8 in 1867 to 40 in 1890; in Queensland, from 4 in 1877 to 8 in 1890, but separations are not yet reported; in South Australia, from 3 in 1867 to 11, 11 and 9, in 1877-79 and 9, 11, 11 in 1883-85, decreasing to 6 and 2 in 1889 and 1890. West Australia granted three divorces in 1890; Tasmania granted from none to 7 between 1867 and 1890; there being 2 in 1890. New Zealand granted 24 divorces in 1886 and the same in 1890, with 32 in 1888. In the eight States which now give annual statistics of divorce, the movement from 1886 onward has been as follows: Connecticut granted 120 in 1886 and 475 in 1891; Indiana, 1657 in 1886 and 2236 in 90 out of 92 counties in 1891; Massachusetts, 565 in 1886 and 1045 in 1891; Minnesota, 379 in 1886 and 576 in 1892; New Hampshire, 381 in 1886 and 412 in 1891; Ohio, 1889 in 1886 and 2544 in 1891; Rhode Island, 257 in 1886 and 296 in 1892; and Vermont, 129 in 1886 and 165 in 1891, in 12 of its 14 counties.

These figures show that divorces are everywhere increasing, with some few exceptions, and generally far more rapidly than the increase of population. The most marked exceptions are found in such countries as Italy and Austria. The increase is seen in countries of the Greek Church, the Lutheran and other Protestant Confusions, and in some countries under the Roman Catholic faith. In the United States, it is found in all parts of the country. Here, as a whole, the increase is about two and one half times the increase of the population. In some of the older States, however, divorces increase very slowly, as regards population, after they have reached the higher rates of 8 to 10 per cent. of the marriages. But Indiana, which for many years seemed to recover from her early conditions of extremely numerous divorces, had in 1891 a divorce to less than each 1000 of her population, or one third more than 10 years before.

Of the divorces in the United States, 65.8 per cent. were granted on the petition of the wife. Something of this is due to the fact that she is more frequently in the position to take the initiative, and some of it is due to the commonly assigned reason that she is oftener the greater sufferer in an unhappy marriage. That 38 per cent. of the total were granted for desertion, 20 per cent. for adultery, 16 per cent. for cruelty, and 4 per cent. for drunkenness, is no indication of the distribution of the real causes, for the conditions of law, ease or difficulty of proof and the condition of public sentiment are large elements in the problem. For example, one half of all the divorces for drunkenness in the United States occurred in the four States of Illinois, Ohio, Iowa, and Massachusetts, which indicates that conditions favor the use of this plea for divorce in those States, and not that the people of those particular States are more intemperate than those of others. The special examination of 29,665 divorce cases in 45 counties in 12 selected States showed that "in 20.1 per cent. of the whole number intemperance was a direct or indirect cause."

In the 29,670 cases just noted, "the average period of married life between marriage and separation was 6.81 years, while the average period between separation and divorce was 3.02 years." This makes 9.83 years from marriage to divorce. For the United

States the average married life before divorce for the 20 years is 9.17. As a rule, it is longer in the older States than elsewhere. Out of the total of 328,716 divorces granted in 20 years, 25,371 were granted to parties who had been married 21 years and over, or, on an average, 26.95 years. The largest number, however, 27,909, had lived together four years; the next largest—207—three years; while 21,525 had been married only two years, and 15,622 only one year. The European figures generally show nearly the same average length of married life, and in countries where divorces are more frequent, nearly the same proportion of divorces soon after marriage. But it is said to see that the number of divorces after many years of married life is increasing.

In 14.6 per cent. of the cases, the positive statement was made that there were no children. And in 43 per cent. more no mention was made of children as entering into the legal proceedings. Where children do appear, the average is 2.07 to each couple. The presence of children, especially in the larger families, is a deterrent from divorce, except among the poorer classes, where it often leads to desertion by the father, and then application for divorce by the deserted wife. Connecticut, and perhaps other States, now make desertion and refusal of support a criminal offense.

Important light is thrown on migrations from one State to another to obtain divorce by a comparison of the place of marriage with that of divorce. Of the 328,716 divorces in the United States in 1867-86, the place of marriage is given in the libels for divorce, which furnish the basis of the official statistics in 289,546 cases. Of the remaining 31,380, more than one fourth were in Connecticut, where this particular is not required in petitions for divorce. But of the 289,546 cases, 80.1 per cent. were married in the States where the divorce occurred, leaving 19.9 per cent. to be divided between those who migrated without thought of divorce at the time and those who left the State of their residence to seek divorce elsewhere. Allowing for the migratory character of our population and the length of time between marriage and divorce, it is evident that conflicting laws actually affect a small part either of the marriages or divorces. That people can avail themselves of the conflicting laws is one thing. How far they actually do this is quite another. Considerations of time, expense, convenience, and social restraints all operate as deterrents.

In 1886 nine States and Territories permitted marriage after divorce without the slightest limitation, and 15 more practically permit remarriage. Nineteen permit marriage, but under certain restrictions, such as exception in case of adul-

Legislation. tery, permission of the court, restriction for six months to both parties, and for 10 months to the wife, and for two or three years to the defendant. The number of persons who actually remarry after divorce unfortunately is unknown. In Connecticut for two recent years the number of divorced persons who married in each year was less than 40 per cent. of those divorced in the same years, and some European figures show about the same ratio. The census of the United States for 1890 gives 120,496 divorced persons living in the country at that time. This is but little more than double the number probably divorced in that year, and can hardly represent the number of persons *in transitu* between divorce and remarriage and the large number who do not remarry at all, as statistics of this class are difficult to collect.

The tendency of legislation in the United States for the last 10 years has been in the right direction with slight exceptions. Marriage and divorce laws are gradually being changed for the better. More or less important changes have been made in a dozen States, and with wholesome results. The old "omnibus clause" of Connecticut and several other States now remains on the statute book of Washington alone. The term of residence before a party can apply

for a divorce in a State, which ranges from 90 days in Oklahoma to five years in Massachusetts, has been raised in California, Georgia, and South Dakota. The remarriage of the defendant has been greatly restricted in Maine, Massachusetts, Michigan, and Vermont. The last two now require delay between the application and trial, and some have recently required the attention of the attorney of the State in its interests. Delaware forbids the trial in its courts of a case when the cause occurred out of the State and the petitioner was a non-resident at the time, unless the cause alleged is also a ground for divorce in the State from which the party came. This movement would probably have gone on much farther but for another in behalf of uniform laws, which has been gathering momentum for several years.

Of the need of greater uniformity there has been no doubt. But the extent to which it should be sought and the way to secure it have been warmly discussed. The abuses under conflicting divorce laws and the quite as serious ones under the marriage laws are well known. The marriage laws are in conflict regarding the degrees of relationship, consent of parents, age at which parties may lawfully marry, license fees, registration, degree of publicity, and the effects of a remarriage after divorce. The divorce laws vary in regard to causes for which divorce may be granted, from no divorce or marriage laws in South Carolina to 14 causes for divorce in New Hampshire; in respect to the class of courts and their practice; to residence, restrictions upon remarriage and effects of a divorce.

Naturally public attention has turned to the need of a uniform national law of marriage and divorce, which can be obtained only through an amendment of the Constitution of the United States. This would give jurisdiction over these subjects to Congress or to the States on some prescribed basis. The difficulties in the way of this plan are serious.

Some of them are: The consent of the States to the transfer of a portion of their reserved powers to the Congress, with the possibility at least that in time the closely related parts of domestic law relating to wills, interstate succession to property, and the like would have to go to the same jurisdiction as marriage and divorce; the difficulty of adopting one law for a great variety of people in race and local customs; the risk of increasing the number of divorces under some law reflecting the average opinion of Congress; and the small part of the marriages and divorces that would really be affected by uniform legislation, as practically shown by the statistics already given.

Just as the Government report was to appear, the State of New York created a Commission on Uniform Legislation on a plan first suggested by ex-President Woolsey, of Yale, in 1881, and invited other States to do the same. At present (December, 1893), 19 States, including the most important, have created similar commissions. Two or three conferences have already been held and important suggestions made. This has been called the most important movement in juristic work since the adoption of the Federal Constitu-

tion. Enough States are already in it to do good work and insure success so far as it can be won on this plan. It disturbs no rights of the States; leaves a large freedom for local conditions to shape local law; can reach many serious abuses; and, if it is finally made evident that the constitutional change should be made, the work done will demonstrate the necessity and prepare the way for the necessary amendment.

But it is clear that the roots of reform touching marriage and divorce lie deep and spread far in the social soil. It cannot be too strongly urged that these are but organic parts of the larger problem of the family and its relation to the social order, and that constructive work of the broadest and most fundamental order must be done. A generation of clergymen, lawyers, teachers, writers, must be educated in the subjects that lie about the family before we can look for the best results in legislation and legal administration, where, by the way, half the work of legal reform in divorce is to be done. This work is now going on. The constant effort of the Divorce Reform League to introduce the study of the family and of sociology, especially that of the social structure, its institutions and forces from a sociological point of view rather than the general one of the several social sciences, its insistence on statistics, together with the general interest of many others in sociology, are telling. Where a dozen years ago almost no work was done in these subjects, today nearly all the higher educational institutions do something, and some of them have very full courses on the family and sociology. More recently colleges for women are doing more work of this kind, and will soon put into society a large number of exceptionally well-qualified students and leaders of reform.

The effect of this upon other reforms demands brief notice here. The fact that the family is germinal of the other great social institutions, and enters into the social order just as tissue makes up every part of the human body, will soon compel the attention of both students and reformers. The modern change from the exclusive attention to the individual being, the individual institution, or a single class of men and institutions, to the individual, the institution and the class in their intricate organic relations, is slowly working a great revolution in the methods of reform. The method popular just now in some quarters, of massing a great number of more or less related subjects under one leading reform, is a partial abandonment of the old individualistic method without direct recognition of the modern one of organic effort. Its weakness is that it is still essentially individualistic. More and more will criminal reform and that of intemperance, poverty, and vice, turn from the prison, the saloon, the almshouse, the factory, and the brothel as chief points of attack, to the home as the most important single center of successful reform, where preventive and constructive work can be done. We shall learn to do less "for the home," as the phrase goes, and do more through it. Both Church and State, school and reform, have much to learn in the application of self-restraint in their efforts "for the home," that the home may get on its

A Uniform National Law.

own feet and learn the nobler lesson of Christian charity, which helps most and best when it teaches self-respect and encourages self-help as one of the richest gifts of God to man.

This article has made no reference to the religious doctrines regarding marriage and divorce. But its writer will simply add a thought

Religious Ground.

and because that must be left for experts in biblical scholarship. The hint, however, is thrown out that the time is soon coming for a re-examination of the various conclusions of past discussions under the methods of modern scientific study. This may revise our forms of statement and defense, while it may not change the substance of the form or conclusions of various parts of the Church. Nor should this surprise the reader who recalls the far better knowledge we have of the individual in the Bible in the last century since the social and political place of the individual man began to be more fully understood. The Church in the Christian centuries has studied marriage, divorce, chastity, etc., as isolated subjects, rarely taking them in their connection with the family, which it has seldom attempted to treat until of late. When it learns through sociology to discriminate institutions, to differentiate and coordinate without obliterating social functions, it will gain new strength in some if not in all of its old and fundamental positions. The remarkable thing about the most important utterance of Christ about divorce is that He pointed to nature in the constitution of the sexes for His doctrine, and in His statement gave the fundamentals of the monogamous family—that is, He threw the whole subject into the field of science, and thus made it the common problem of the religious teacher and the scientific student.

SAMUEL W. DIKE.

DOCK STRIKE OF LONDON, 1888, THE.—In its importance to the whole labor question of England, this strike has perhaps greater relative value than any other struggle within the last decade. To understand its import, it will be necessary to know somewhat of the conditions which preceded it. The East End of London has for years been the despair of philanthropists and reformers. It seemed to be full of hopeless, helpless misery that was beyond any one's power to cope with; and of the most hopeless description was the lot of the "casual" docker. The work of unloading and carrying to the warehouse the cargoes of ship requires as little skill as any labor that one can do; and being, for that reason, work that any man can do, it had become the refuge of all those who could not find work elsewhere. But it was only a last resort; for the force of competition among the men had made the rates of pay so low and the chances of work so uncertain that the dock gates were practically the lowest rung in the ladder. The hopeless apathy which the men displayed to all attempts to organize

them into unions made it seem that all efforts were wasted. When, however, the Gas Workers' Union was formed in 1888, and the gas men gained substantial improvements in their lot, the "dockers" began to pluck up courage, and the trade-union that Mr. Tillet (*q.v.*) was organizing grew rapidly. The strike itself broke out on August 12 over a small dispute at the South West India Dock, which was, however, only the spark which kindled the blaze. The real grievances had long rankled in the minds of the men. Two days later, all the men from the South West India Dock being out, they sent to Tom Mann (*q.v.*), asking his help in organizing, and in calling out the men working in the other docks, which are dotted here and there for miles along the Thames.

After two days' continual speech-making outside the various dock gates, nearly all the dockers responded to the call. John Burns (*q.v.*) now volunteered his assistance, and from this time became the leading figure in the struggle. In ten days the whole of the riverside workers, including

Extent.

all the stevedores, painters, scalers, corn porters, deal porters, coal-heavers, seamen and firemen, carmen, lightermen, bargemen, and all whose work in any way affected that of the "docker," came out on strike; most of them without making any demand for themselves, but simply to show their sympathy with the dockers, and strengthen the claims they were making. Some 150,000 men were involved. Day after day during the whole of the five weeks that the strike lasted mass meetings were held on Tower Hill, at which all the news and the orders of the day were given; the meetings then marching in procession with banners and emblems westward to the city and back. The leaders meantime worked night and day at the gigantic task of organizing and providing sustenance for the heterogeneous mass now depending on them. Stirred by the example of the riverside workmen, who had voluntarily made such sacrifices, all England was roused to sympathy with the men, and liberal subscriptions began to pour in. Clergymen and members of the nobility subscribed. At least \$200,000 passed through the hands of the committee. Nor was this feeling confined to England alone. In Australia their cause was taken up in an unprecedented manner, subscriptions being raised in all quarters; indeed, the generous support from Australia may be said to have ensured the victory, for thousands of pounds was sent from thence during the last two weeks of the strike. From first to last the men held firm to their

Demands.

demands, which were: "No man to be taken on for less than four hours at a time; contract work and piece-work to be abolished, and wages to be raised to six pence (12 cents) per hour, with eightpence (16 cents) per hour for overtime." All who knew the conditions of dock work felt that the demands were so moderate that the men could not afford to accept less; while, on the other hand, the dock companies remained obdurate. The whole trade of the port of London was at a standstill; the effects began to be felt in every home, until the general public began to take a

direct interest in the struggle, demanding that there should be an end to it. On September 6 a conciliation committee met at the Mansion House to act as intermediaries between the directors and the men. To this committee, which consisted of Cardinal Manning, the Bishop of London, the Lord Mayor of London, Sir Andrew Lusk, Sir John Lubbock, and Mr. Sydney Buxton, most of the final negotiations were due. Finally, principally through the efforts of Cardinal Manning and Mr. Sydney Buxton, the strike was brought to a

close on September 14 by the directors granting all the men's demands, which were to come into operation on November 4. The gaining of better conditions by the dockers is the least important of the results ensuing from this strike. It opened a new page in the history of English labor movements. Before then, with very few exceptions, each trade had been obliged to fight its own battle single-handed; in this case not only did all the kindred workers unite with them, undertaking all the hardship and misery that a strike means, with no other purpose in view than the betterment of their brothers, but all the other trades helped, too, by money and sympathy. Never before was the feeling of solidarity so greatly evinced. The chord so strongly struck has awakened into life the public conscience on such matters, which even now is taking shape in the various labor movements and reforms that are agitating the public mind in England.

ALFRED HICKS.

DOLGEVILLE is the name of a little manufacturing town in the Mohawk Valley in New York State, 220 miles due north from New York City. It is famous for the cooperative or profit-sharing experiments carried on there by Mr. Alfred Dolge. Mr. Dolge, a German, came to the little place, then called Brockett's Bridge, in 1874. With the small capital at his command he bought an old tannery there, and prospered, and soon added a felt industry, to-day the main interest. At first he made felt almost solely for pianos. In 1883 he commenced making the Dolge "felt shoe." Prospering in this, he increased his works, and now employs many hundred men. In 1887 the name of the place was changed to Dolgeville. As early as 1880 Mr. Dolge started a mutual aid society among his employees, to help them to become independent and capable of managing their own affairs. In 1882 he added a pension plan, entitling each employee, after 10 years of employment, to a pension in case of accident, sickness, or old age, consisting of 50 per cent. of his last year's salary. If he had worked 13 years, it was to be 60 per cent., and so on till he who had worked 25 years was to be entitled to 100 per cent. In 1887 Mr. Dolge added still another element to his scheme—a plan of life insurance. This was simply to grant a life insurance of \$1000 to each employee who had worked 10 years, and another \$1000 for 10 years' more service. Mr. Dolge has also built a club-house with gymnasium, library, etc., for his employees; he has opened a park and opened a free evening school; a school society has been formed and an academy founded.

Mr. Dolge objects to "profit-sharing" (*q.v.*), but believes that one of the greatest factors in harmonizing labor and capital will be "the education of the working man."

With him there is no such thing as "profits." All gains are "earnings"—the earnings of labor or of capital, or of both together. The labor may be manual or intellectual, or both; the manual labor may be skilled or unskilled; the intellectual labor, that of the foreman, the superintendent, the general manager, the inventor, the salesman, the proprietor (who guides all and is responsible for all).

Mr. Dolge has, therefore, directed all his efforts toward securing "a just distribution of earnings." To do this he has necessarily had to determine what the exact earnings of each individual in his business were, irrespective of the question of salaries and wages. In this direction he has had some success in a most elaborate system of book-keeping.

Practically, what he does is to set aside each year a calculated amount of profits of his business for the benefit of his men. He is with them naturally popular, and his works a happy community. He is to-day the largest felt and felt-shoe manufacturer in the world, doing a business of about \$1,000,000 a year, with an import business of as much more. Up to 1890 the firm had paid out \$170,000.

DOLLAR. See CURRENCY.

DOMESTIC SERVICE.—The condition of domestic service in the United States has been affected by two historical facts. The first is the change made within a hundred years by the substitution of the factory system of manufactures for the previous domestic system. This change, involving a division of labor, has necessitated a readjustment of the work within the household. It has increased the demand for persons giving all of their time to household work, and it has limited the supply. The division of labor is not yet fully accomplished, and out of this fact grows a part of the friction found in domestic service. The second historical fact is the series of political revolutions of the century acting in connection with certain economic and social forces. Domestic service in America has had three distinct phases. During the early colonial period service of every kind was in general performed by "redemptioners." The colonization of the New World gave opportunity for the transportation and subsequent employment in the colonies of large numbers of persons who as a rule belonged to a low class in the social scale. These redemptioners, who paid their passage to this country by selling themselves into service, were found in all the colonies, tho more numerous in the Southern and Middle colonies than in New England. In Virginia and Maryland they apparently outnumbered negro servants until the latter part of the seventeenth century. Some of these redemptioners and many of their descendants became in time wealthy and prominent members of their communities, especially at the North, but for a long time they were generally considered

Development in the United States.

the offscourings of English cities, and formed a distinct class in the social order lower than their masters or employers. In view of this fact, a reproach was of necessity attached to all belonging to the class and to the designation applied to them.

A second phase came about the time of the Revolution, when at the North the indented servants as a class were gradually supplanted by free laborers and at the South by negro slaves, who inherited with large interest the reproach attached to redemptioners. The social chasm that had existed at the North between employer and employee under the system of bond servants disappeared. The free laborers, whether employed in domestic service or otherwise, were socially the equal of their employers, especially in New England and in the smaller towns. They belonged by birth to the same section of the country, probably to the same community; they had the same religious belief, attended the same church, sat at the same fire-side, ate at the same table, and had the same associates as their employers. They were in every sense of the word "help." A survival of this condition of affairs is seen to-day in farming communities, especially at the West. In the South, on the contrary, the social chasm became impassable, as negro slavery entirely displaced white labor.

This condition of democratic service at the North and slavery at the South continued in both sections from the time of the Revolution until about the middle of this century. Between 1850 and 1870 four important political changes revolutionized the character of domestic service, and have introduced the third period in the history of the subject.

The first of these was the Irish famine in 1845. Previous to this time the emigration to this country from Ireland had been small, averaging not more than 20,000 annually between 1820 and 1846. In the decade previous to the famine the average number of arrivals had been less than 35,000 annually. In 1846 the number was 51,752, and this was more than doubled the following year, the reports showing 105,536 arrivals in 1847. In 1851 the number of arrivals from Ireland had risen to 221,253. Since that time the number has fluctuated, but between 50,000 and 75,000 persons annually came to this country from Ireland. A large proportion of these emigrants, 49 per cent. during the last decade, have been women who were classed as "unskilled laborers." Two occupations were open to them. One was in factories, where, as manufacturing processes became more simple, unskilled labor could be utilized. The Irish emigrants soon displaced New England women, who found new opportunities for work of a higher grade. The second occupation open to the Irish was household service. Here physical strength formed a partial compensation for lack of skill and ignorance of American ways, and the Irish soon came to form a most numerous and important class engaged in domestic employments.

A second important European change influencing the condition of domestic service was the German Revolution of 1848 with the events pre-

ceding and resulting from it. Before this period the emigration from Germany had been insignificant, fewer than 15,000 coming to this country annually between 1830 and 1840. In 1840, owing to political reasons, the number had risen to 29,704; but in 1841, after the accession of Frederick William IV., it fell to 15,291. It soon became evident that the hopes raised by the accession of the new monarch were without foundation, and emigration rapidly increased, until the number of emigrants coming to America reached nearly 75,000 in 1847. During the year of the Revolution the number decreased; but the failure of the cause of the revolutionary party and the political apathy that followed again increased the movement toward America. This reached its climax in 1854, when the number of Germans arriving in this country was 215,009—a number equaled but once since that time, altho the number has averaged nearly 150,000 annually during the last decade.

A large number of these emigrants have been women, the proportion of women emigrating from Germany being greater than from any other foreign country except Ireland. The ranks of domestic service have been recruited from their number also, the Germans being second only to the Irish as regards the number and proportion engaged in this occupation.

A third political influence affecting the question was the establishment of treaty relations between the United States and China in 1844. This fact, and the discovery of gold in California in 1848, and the building of the Union Pacific Railroad in 1867-69, opened the doors to the emigration of considerable numbers of Chinese. Many of these found their way into domestic service, and on the Pacific coast they have become formidable competitors of other nationalities in this occupation.

These political and economic conditions in Europe and the breaking down of long-established customs in Asia have thus, since 1850, brought to this country large numbers of men and women who have performed the household service previously given by native-born Americans. The presence of the Irish in the East, the Germans in the West, the Scandinavians in the Northwest, and the Chinese on the Pacific coast has thus introduced a new social as well as economic element at the North. It has led to a change in the relation of employer and employee; the class line that was only faintly drawn in the early part of the century between employer and "help" has been changed into a caste line, which many employers believe it to their interest to preserve. The native-born American fears to lose social position by coming into competition with foreign labor.

While this change has been taking place at the North in the character of the service owing to political conditions in the Old World, a similar change has taken place at the South growing out of the abolition of slavery in 1863. The negroes who had previously performed all domestic service for their personal expenses have since then received for the same service a small remuneration in money. This fact prevents now as effectually as during the slavery period any competition in domestic service on the part of native-born white employees.

An indication of these various changes in the condition of domestic service is seen in the history of the word "servant." As used in England and in law at the time of the settlement of the American colonies, it signified an employee, and no odium was in any way attached to the word. This is indicated by the various definitions given in the early dictionaries, *servant* being defined as "a man or woman that serves another." But five things led to gradual disuse of the word: First, the reproach connected with the word through the character and social rank of the redemptioners; second, the fact that when the redemptioners gave place at the South to negro slaves the word "servant" was transferred to this class, and this alone was sufficient to prevent its application to whites; third, the leveling tendencies that always prevail in a new country; fourth, the literal interpretation of the preamble of the Declaration of Independence; and fifth, the new social and political theories resulting from the introduction of French philosophical ideas. At the North the word "help," as applied especially to women, superseded the word "servant," while at the South servant was applied only to the negro. From the time of the Revolution, therefore, until about 1850, the word "servant" does not seem to have been generally applied to white persons of American birth

Use of Words.

in either section. Since the introduction of foreign labor, at the middle of the century, the word "servant" has again come into general use as applied to white employees; not, however, as a survival of the old colonial word, but as a reintroduction from Europe of a term signifying one who performs so-called menial labor, and restricted in its use, except in a legal sense, to women who perform domestic service. The present use of the word has come not only from the almost exclusive employment of foreigners in domestic service, but also because of the increase of wealth, and consequent luxury in this country, the growing class divisions, and the adoption of many European habits of living and thinking and speaking.

Domestic service has also been affected by the economic conditions of the century. Some of these may be indicated by the tabular returns received to a series of schedules sent to employers and employees. The tables represent the returns received from 1005 employers concerning 2545 employees, and the returns received from 719 employees. These returns indicate the general conformity of domestic service to the economic laws governing other industries and also the nature of the economic laws developed within itself. The extent to which domestic service has been affected by foreign emigration is indicated by the following tables:

TABLE I.
PLACE OF BIRTH OF EMPLOYEES.

PERSON REPORTING.	NUMBER.			PERCENTAGES.		
	Native Born.	Foreign Born.	Not Given.	Native Born.	Foreign Born.	Not Given.
Employer	922	1,212	411	36.23	47.62	16.15
Employee	324	395	45.06	54.94

TABLE II.
NUMBER OF FOREIGN BORN IN DOMESTIC SERVICE.

Southern section.....	3.95	2.22
The United States	\$7.18	\$3.23

The conformity of domestic service to the general laws governing wages is shown by the following table. It shows that wages in domestic service, as in other occupations, are lowest at the South and highest on the Pacific coast.

Table IV. shows that in domestic service, as elsewhere, skilled labor commands the highest wages. The cook is the skilled workman. The general servant, who is expected to unite in herself all the functions of all the other employees in the list, becomes, by virtue of this fact, an unskilled workman, and therefore receives the lowest wages.

TABLE IV.

AVERAGE WEEKLY AND DAILY WAGES BY OCCUPATIONS.

It also seems to be true in domestic service as elsewhere that the skilled laborer does his work better than the unskilled workman. The question was asked of employers, "What is the nature of the service rendered? Is it 'excellent,' 'good,' 'fair,' or 'poor'?" The replies show that, in proportion to the number of answers, the largest percentage of service characterized as "excellent" is rendered by cooks, while the largest percentage characterized as "poor" is given by general servants.

It was also found that the wages of men engaged in domestic service are higher than the wages of women. This will be seen by reference to Table III. and Table IV. Two things, however, must be borne in mind: First, that nearly all the men classified as cooks are employed on the Pacific coast, where wages are relatively high; second, that 40 per cent. of men in domestic service do not receive board and lodging in addition to cash wages, while only 2 per cent. of women so employed, principally colored women and laundresses, do not receive board and lodging. But altho these facts modify the discrepancy between the wages of men and women, they do not wholly remove it. Whether the difference is as great as in other occupations cannot be here stated.

For the facts on this point, see articles WAGES and WOMEN'S WORK AND WAGES. For a consideration of the facts, see articles EIGHT-HOUR PHILOSOPHY and PRODUCTION. See also HOUSEHOLD ECONOMIC ASSOCIATION.

The following table will show the results in regard to these two classes of employees:

TABLE V.
NATURE OF SERVICE RENDERED.

OCCUPATION.	Total Number of Replies.	Not Answered.	KIND OF SERVICE RENDERED.							
			EXCELLENT.		GOOD.		FAIR.		POOR.	
			Number.	Per Cent.	Number.	Per Cent.	Number.	Per Cent.	Number.	Per Cent.

* In the classification in these two tables the employees in several large boarding-houses were omitted. All of those included under the term "nurses" are nurse-girls, with the exception of the few receiving the highest wages.

These, with other facts and tables that could be given, may be considered as showing the general conformity of domestic service to economic law.

Some of the difficulties presented to the employer of domestic service have been indicated.

They may be summed up as follows: the difficulty of assimilating **Difficulties**, into the family those who are of a different nationality, and consequently hold different industrial, social, religious, and political beliefs; the spirit of restlessness that everywhere prevails among the working classes, tho not peculiar to them, and the resulting brief terms of service; the necessity of engaging for skilled labor the assistance of unskilled laborers; the lack of reliable means of communication with those desiring employment; the prevailing indifference among employers to the action of economic law and the failure to realize that in domestic service as elsewhere the course followed by one employer has an appreciable effect on the condition of the service as a whole.

On the side of the employee the advantages in domestic service as an occupation are high wages, the healthfulness of the work, that it gives the externals of a home, training in household affairs, and congenial employment to those whose tastes lie in this direction. These advantages are offset by the disadvantages that lie in the fact that there is little or no opportunity for promotion in the service, the utter lack of organization in the occupation, the irregularity of working hours, the lack of free time evenings and Sundays, the impossibility of having more than the externals of a home, and the absence of all opportunities for personal improvement and social advantages. The most serious disadvantage is the badge of social inferiority placed on the class of domestic employees. This badge consists in the use of the word "servant" and of the Christian name in address, the wearing of a livery, the enforced acknowledgment of social inferiority, and the giving of fees. The latter custom has perhaps done more than any other one thing to change what should be an honorable employment into a menial service.

The underlying difficulty in the present condition of domestic service is the universal failure to recognize it as a part of the great industrial question of the day. Domestic service is amenable to economic law in precisely the same manner as are other forms of labor, and until the study of the subject is made to begin at this point all plans to bring about a better condition of affairs must prove fruitless.

LUCY M. SALMON.

It is often asked why, if women's wages are so low and there are many unemployed, is it frequently so difficult to get servants? The answer is that women free from family ties and of character, age, and ability for service, are not often unemployed. The unemployed problem is mainly of men and of women with family ties or other disqualifications for service. As for low wages, there is a plain explanation. Domestic service, even in the best homes, usually implies constant submission to one person's will, and constant confinement, except, perhaps, for

one "evening out" a week. In the store or the factory, girls almost always have all their evenings and Sundays perfectly free, and when at work are with others under fixed regulations rather than under a personal master. Almost anybody would prefer such a measure of freedom, even with low pay, to higher pay and less freedom. The cure perhaps lies in making domestic work a trade, with fixed hours. Miss Jane Addams, in an article in *The American Journal of Sociology* for March, 1896, finds it perfectly natural that girls should prefer factory labor, with its social equality and industrial independence. She says:

"If the 'servant' attitude were once eliminated from household industry, and the well-established one of employer and employee substituted, the first step would be taken toward overcoming many difficulties. . . . Most of the cooking and serving and cleaning of a household could be done by women living outside and coming into a house as a skilled workman does, having no 'personal service' relation to the employer. There is no reason why the woman who cleans windows in a house should not live as full a domestic and social life as the man who cleans windows in an office."

Ed.

(See HOUSEHOLD ECONOMIC ASSOCIATION; WOMEN'S WORK AND WAGES.)

DONI, FRANCESCO, was born in Florence about the year 1503. In 1552 appeared at Venice his *I Mondi*, and the year after his *I Inferni*, in which he describes his ideals of a communistic state, where there is community both of property and of wives. The books were translated into French, and seem to have arrested some attention, but to have developed few thoughts that were new. Doni died in the year 1574.

DONISTHORPE, WORDSWORTH, was born in Yorkshire, England, March 24, 1847; was educated at Leeds School and Trinity College, Cambridge, and graduated with first-class honors in 1869. He traveled in Europe, and was imprisoned in Strasburg in 1870 for taking part in a riotous republican demonstration, but was soon released. He was called to the bar in 1879. He was imprisoned in 1876 under the Vaccination Act, but was successful in preventing his own children from being vaccinated. In 1880 he founded the State Resistance Union, of which he was the first president. In 1881 the basis of its operations was widened under the title of Liberty and Property Defense League, and the Earl of Wemyss became its president. In 1888 Mr. Donisthorpe retired from the association, owing to differences of opinion as to the proper scope of the League. During the years 1887-88 he edited *Jus*, the organ of individualism. In 1887 the Free Libraries Act was applied to Kensington, and he fought the question till 1890, when the vestry surrendered, and paid his share of the rate, together with his costs. A full account of the singular correspondence may be found in *Liberty*, March 7, 1891. He is president of the Legitimation League at present (1894). He is occupied in lecturing, writing for some of the papers and magazines, and is preparing several books for publication. Among his writings are: *Principles of Plutology* (1876); *Serfdom*,

Wagedom and Freedom (1880); *Capitalization of Labor* (1887); *Individualism* (1889). He also wrote *Overlegislation* in 1883, and again in 1884 for the Liberty and Property Defense League, and contributed an essay to *A Plea for Liberty* in 1891; *The Future of Marriage*, in the *Fortnightly Review* (February, 1892); *Love and Law*, published by the Legitimation League; *Bastardy*, in the *Free Review*. In 1887 he drew an Adulteration Bill, which was brought into the House of Lords by the Earl of Wemyss, and passed the first reading, but owing to the lateness of the session was dropped. It has not since been revived. He claims to belong to the individualist school, which he considers "Anarchist in principle and final aim, but opportunist in action. So long as we are unprepared for private enterprise in any department of activity, such as the enforcement of the fulfillment of contracts, let the State do such work as well as it possibly can." In politics he calls himself Republican; in religion, atheist; in morals, egoistic hedonist.

DONNELLY, IGNATIUS, was born in Philadelphia November 3, 1831. His father, Dr. Philip Carroll Donnelly, was an eminent physician in that city. After his graduation from the high school he entered upon the study of law, and in 1853 was admitted to the bar. Two years later he was nominated by the Democrats for the House of Representatives, but declined the nomination. In 1856 he moved West, where he has spent the greater part of his life. In 1859 he started the *Dakota County Sentinel*. In 1857 he was nominated for State Senator by the Republicans, but was defeated. He was the first to organize the Dakota County Agricultural Society. In 1859 he was elected Lieutenant-Governor of Minnesota. He has since then taken an active part in the political life of the West. In 1874 he started the Anti-Monopoly Party of Minnesota, and he is now a leader in the People's Party. Mr. Donnelly has written *The Great Cryptogram*, *Atlantis*, *Ragnarok*, *Doctor Huguet*, *Cesar's Column*, and *The Golden Bottle*, all of which have been widely read. He is now editor of *The Representative*, a leading People's Party paper published in Minneapolis.

DOUAI, DR. ADOLF, a German-American socialist, was born in Altenburg in 1819. He studied philosophy and theology in Germany, and became a private tutor in Russia. Receiving the degree of Doctor of Philosophy at Dorpat, he returned to Altenburg and established a private school. Arrested and, after being once discharged, rearrested and imprisoned one year for his socialistic utterances and his part in the Revolution of 1848, he escaped to Texas in 1852, and as a journalist and teacher traveled through many of the States, carrying socialism with him. He took part in the early socialist organizations in New York City, and was editor of the *Arbeiter Union*, established in 1871, and from 1878 to his death, in 1888, associate editor of the *New Yorker Volkszeitung*.

DOVE, PATRICK EDWARD, was born at Lasswade, near Edinburgh, Scotland, in 1815.

A land-owner devoted to philosophical and economic letters, he studied in France and Germany, as well as Scotland, and in 1850 published *The Theory of Human Progression and Natural Probability of a Reign of Justice, the First Part of a Projected Treatise on the Science of Politics*. It arrested attention of scholars like Hamilton and Charles Sumner. In it he comes to conclusions as to land very nearly similar to those of Henry George (*q.v.*); and Mr. George, when lecturing in Edinburgh in 1884, praised his book very highly. Some have even claimed that it was from this book that Mr. George drew some of his ideas. Dove seems to have been a universal genius, writing alike on the sport of Scotland, theological discussions, and the science of government. He contributed the article on government for the *Encyclopedia Britannica*, and won recognition by his books in various quarters. He died in Scotland in 1873.

DOW, NEAL.—General Neal Dow, the "Father of the Maine Law," was born in Portland, Me., March 20, 1804. His parents and all his ancestors for many generations were Friends, and he was brought up in that faith. His education was primarily in the public schools, afterward in private schools, after that at the Portland Academy, and then at the Friends' Academy in the town of New Bedford, Mass.

In his youth he was a Whig, but a Republican as soon as that party was born. He became a member of the Prohibition Party as soon as he became satisfied that Prohibition through the Republican Party was impossible. He was twice Mayor of Portland, and twice a member of the Legislature. In his first mayoralty term, in 1851, he framed an anti-liquor bill and carried it to the Legislature two days before its adjournment; he had a hearing in the Representatives' Hall in the afternoon; the bill was reported the next day precisely as he had written it, was put through all its stages by a vote of 86 to 40 in the House and 18 to 10 in the Senate, enacted on the same day, and took effect on its approval by Governor Hubbard (a Democrat) the next day. It is known in all the English-speaking world as "the Maine law." On the breaking out of the Rebellion Mr. Dow entered the army, September, 1861, as colonel of the Maine Volunteers, of 1000 men, which he recruited. He also recruited the Second Maine Battery by special commission from the Secretary of War. In April, 1862, he was commissioned brigadier-general by Mr. Lincoln. He was twice wounded in battle, and while occupying a plantation house outside of the lines was captured at night and taken to Libby Prison at Richmond, Va., where he was retained eight months and then exchanged for Fitz-Hugh Lee.

He has visited England three times, delivering about 500 addresses under the auspices and as the guest of the United Kingdom Alliance. In 1880 he was the candidate of the Prohibition Party for President. In June, 1894, the completion of General Dow's ninetieth year was celebrated by memorial meetings all over the world. A vast international temperance congress was held in celebration at Prohibition Park, Staten Island, N. Y., at which eminent

speakers and thinkers from all parts of this country and even from Europe discussed the temperance question in all its phases.

DRAGE, GEOFFREY, born in 1860, was educated at Eton and Christ Church College, Oxford. He then traveled for some years, visiting foreign universities, studying at Berlin and Moscow. He visited America, Africa, and Australia, attending nearly all the parliaments of the world, and taking great interest in political and social questions. He was appointed Secretary to the English Royal Commission on Labor in 1891, and organized office staff; prepared the series of reports on foreign countries. He is author of *Criminal Code of Germany* (1885); *Cyril* (1889, a novel in 6th ed.); *Eton and the Empire* (1890, 5th ed.); *The Unemployed* (1894); *Eton and the Labor Question* (1894, 2d ed.); *Old Age Pensions* (1895).

DRED SCOTT DECISION.—In 1834 Dred Scott was a negro slave of one Dr. Emerson, in Missouri, and taken by his master to Rock Island, Ill., where slavery was prohibited by statute. In 1836 Dred married Harriet, another slave of Dr. Emerson's, and in 1838 returned to Missouri with his master. Here he discovered that by decisions of Missouri courts, his transfer by his master to Illinois had made him a free man, and on being whipped by his master, he, in 1848, brought suit against him for assault and battery, and obtained judgment in his favor. On appeal, the Supreme Court of Missouri, in 1852, by two justices, the Supreme Judge dissenting, reversed the decision and remanded the case to the Circuit Court. Soon after Dr. Emerson sold his slaves to J. F. A. Sanford, of New York City, and the case became still more involved. It was argued in the Supreme Court of the United States in the December term of 1855 and 1856, and judgment pronounced March 6, 1857. The court decided, 7 judges to 2, that the Missouri court had not jurisdiction, and directed the suit to be dismissed. But the judges went on to pronounce general judgments, denying the legal existence of the African race as persons in constitutional law; a denial of the supreme control of Congress over the Territories, and a denial of the constitutionality of the Missouri Compromise. The decision created general excitement. It was the last attempt to decide the slavery contest by form of law, and itself did not a little toward precipitating the war. Judge Curtis dissented from the extent of the decision, and said, "A great question of constitutional law, deeply affecting the peace and welfare of the country, is not, in my opinion, a fit subject to be thus reached." (See ABOLITIONIST MOVEMENT.)

DRESS REFORM.—Near the beginning of the last decade of the nineteenth century dress reform in the United States took definite shape under the auspices of the National Council of Women. Before this there had been organized efforts to improve the dress of woman; but these movements had no distinct connection one with another, either in precise object or in method of procedure.

Dress reform in the fifties and sixties, the first

movement, began with the effort of individual women to emancipate themselves personally from the burdens of dress then prevailing. The costume adopted by those freedom-loving women, among whom were Lucy Stone, Elizabeth Cady Stanton, and others of the most eminent women of the century, was called "Bloomer" by the newspapers and the general public, after the name of one of the earliest women (but not the first) to wear the costume. It was simply the dress of the period (which was usually a gathered waist, full sleeves, often "flowing," and a plain full skirt) loosened to be comfortable and shortened nearly to the knees, with trousers of the dress material either gathered down at the ankle or allowed to hang loose to the foot. This new style of dress was at first welcomed by American women, as made known to them through Mrs. Bloomer's *Lily* and Horace Greeley's New York *Tribune*; but other newspapers quickly discovered and published the fact that the leaders of the new fashion were not only Americans, instead of Parisians, but they were also "strong-minded," which was then a term of reproach. Misrepresentation and ridicule were quickly brought to bear against it, and more or less social martyrdom became the lot of those who continued to wear the divided dress. Few had the fortitude to wear it steadily more than two or three years; but it was laid aside very unwillingly by some, who found it a hindrance to other public work in which they were engaged. Its hygienic merits were soon evident, and on this basis a National Dress Reform Association was organized in 1856, and held several annual conventions with considerable success. It was supposed that there were at one time several thousand women scattered through the United States wearing the dress first called the "Bloomer," and "Bloomers." afterward the "American costume." Most of them gradually abandoned the dress, not because—as is often asserted—the dress was ugly in itself (for tight waists and enormous hoops were then "in fashion," and many men as well as women declared that the fashionable dress was far less artistic than the "Bloomers"), but the tyranny of fashion constantly increased with the *growing power of trade*. The wide diffusion of cut-paper patterns of the Parisian styles and of illustrated and seemingly authoritative fashion articles in the leading newspapers had begun to have great influence upon public opinion and public taste. In many cases the gymnasium dress introduced by Dr. Dio Lewis took the place of the "American costume," and was much worn, especially by young ladies in girls' schools. The skirt was of "bloomer" length, but the Turkish trousers came only a little below the knees. A few of the early dress reformers have never abandoned their radical reform in dress, and in 1874 there was a small and brief revival of their annual conventions with the name True Dress League. The New England Woman's Club, one of the first of women's clubs, appointed a dress reform committee in 1873. Believing that no particular change in outer dress was possible at that time, the committee especially recommended

improvements in the undergarments usually worn. There was no especial advance in this respect upon the practice of some of the early dress reformers, few, if any, of whom wore corsets, and some of whom made and wore "combination undersuits." These were recommended

by the Boston committee, and have since been known as "dress reform" undergarments, the woven union undersuits having come quite generally into use. They were welcomed by the most intelligent women, and have been made more widely known by the business enterprise of Mrs. Jenness Miller and other women who have lectured on the subject, exhibiting the garments and doing much to substitute for underskirts the "divided skirt," which the Viscountess Harberton recommended to English women.

The National Council of Women of the United States, at its first triennial convention, in Washington, D. C., February, 1891, passed a resolution, in executive session, to appoint a committee of women to report suggestions for an every-day business dress for women.

This committee was appointed at an executive meeting in the following May. Those who accepted their appointments with instructions to prepare a symposium on woman's dress for a leading magazine and to report the committee's idea of a business dress for women were Frances E. Russell, Chairman; Frank Stuart Parker, and Annie Jenness Miller. Shortly afterward Octavia W. Bates was added to the committee.

The symposium, comprising papers by Grace Greenwood, Elizabeth Smith Miller, Annie Jenness Miller, Octavia W. Bates, E. M. King, Frances M. Steele, Viscountess Harberton, Frances E. Russell, and an introduction by Mrs. Mary Wright Sewall, President of the National Council of Women, was published in the *Arena* for September and October, 1892.

The committee's report of an every-day business dress for women, "suitable for business

hours, for shopping, marketing, housework, walking, and other forms of exercise," was presented in December, 1892, and afterward inculcated in pamphlet form. It recommended the same improved underwear which had already been advocated, and loose dressing of neck, arms, waist, hands, and feet. To relieve the legs from the customary hindrance of long skirts two forms were recommended, each capable of various modifications: one, the divided skirt, called the "Syrian" in England, and used in this country in the best gymnasia for women (the usual full skirt being divided just above the knees and gathered up around each leg dually); and the other, a gown, or jacket and skirt, with the drapery falling only a little way below the knee, equestrienne trousers, leggings, or extra high boots being added as desired or needed.

These costumes seem to be coming into use, but have not been very generally adopted except for the gymnasium, the bicycle, and mountain-climbing. One session of the National Council of Women, held during the Woman's Congress of Representative Women at the Colum-

bian Exposition, was devoted to the subject of woman's dress. It was a very large meeting, and there was much enthusiasm. The costumes recommended by the committee on dress were shown from the platform on those who took part, and were frequently seen on the fair grounds during the summer.

Within the two and a half years since the committee began its work there has been a great change in public opinion. About 1500 of the most eminent or influential women signed the following agreement:

"We, whose names are signed below, consent to give our influence in favor of an improvement in woman's dress, which will give her the free and healthful use of the organs of her body when working or taking exercise. In signing this paper, we do not become responsible for the suggestions of any one else, nor do we promise to wear or to endorse any particular style of dress. We simply give our influence to help start a strong and healthy movement in favor of freedom and common sense in dress."

The first signers of this paper were May Wright Sewall, Lady Henry Somerset, Frances E. Willard, Clara Barton, Harriet Beecher Stowe, Grace Greenwood, Mrs. Henry Ward Beecher, Elizabeth Stuart Phelps Ward.

As further aid in influencing public opinion (or keeping the rabble respectful) another paper has been circulated among eminent men, saying that they are "among the men of America who approve of this effort women are making." The first signers were Dr. E. A. Sheldon, Principal of Oswego Normal School; Dr. N. S. Davis, long the President of the National Medical Association; T. W. Higginson, and Oliver Wendell Holmes.

The committee on dress of the National Council of Women was increased after the close of the Columbia Exposition by three members—Laura Lee, Bertha Morris Smith, and Annie L. Sloane.

There is great hope for dress reform in the Physical Culture and Correct Dress Societies, the first one of which was organized in Chicago in 1888. There are dress reform organizations of some kind in Sweden, Germany, France, and in England, where Lady Harberton presides over the Rational Dress Society, which publishes an annual *Gazette*. The United States took the lead in this work.

Practical opposition to prevailing fashion is extremely difficult for separate women, especially because whatever is odd or contrary to woman's usual custom seems "unwomanly," and is called ugly. There is a strong superstition in regard to Parisian authority, few realizing that the most unwomanly women, or the fashionable courtesan class, are the leaders of fashion in France, and thence throughout the civilized world.

There are the strongest hygienic reasons in favor of dress reform, as most of the peculiar "female diseases" are either produced or greatly aggravated by woman's usual dress. Foolish fashions waste woman's time, thought, and

strength, as well as her finances. The exaggerations and deformities of woman's natural shape, the constant emphasizing of the fact of sex, and the unnecessary appeal her artificial helplessness makes upon masculine protection, or the excuse it seems to offer for his scorn and abuse, suggest strong reasons for this reform on moral grounds. The welfare of generations to come depends upon it.

DUNKARDS, DUNKERS, OR TUNKERS (from a dialectical form of German *Tunken*, one who dips), is the name of a sect of American German Baptists who call themselves Brethren. The sect is said to have been founded by Alexander Wack in 1708, at Schwarzenau, in Westphalia, an outcome of the Pietist movement. Persecuted at home, between 1719 and 1729 they came to America and settled in Pennsylvania, and subsequently in other States. In their early history the sexes dwelt apart, and marriage, tho not forbidden, was discouraged. A certain community of goods was also established. These features have now disappeared. The sect is marked by its simple life and dress. Dunkards refuse to take oaths or serve in war. They hold love feasts and celebrate the ceremonial of feet-washing and the anointing of the sick with oil. Their creed is evangelical Christianity. Their ministers usually receive no salary. Most of the sect are farmers. The first settlement was "Ephrata," near Philadelphia, but this branch has nearly died out. According to the census for 1890, there were four bodies of Dunkards with 73,795 members,

DUNOYER, CHARLES, was born at Carennac (Lot) in 1786. Studying law at Paris, he became interested in the political events of the day, and with Charles Comte established, in 1814, *Le Censeur*, but the *Terreur blanche* compelled them to discontinue the publication of this paper in 1816. They resumed it 18 months later, but modified its title to *Le Censeur Européen*. The increasing severity of the press laws, however, seriously hampered them, and, finally, the assassination of the Duke of Berry, in 1820, and consequent troubles led to the entire suspension of the paper. After this Dunoyer devoted himself exclusively to economics. He gave at Paris in the *Athenæum Institution* a course of lectures on political economy and moral science. Appointed prefect of the department of the Allier, he was transferred in 1832 to the prefecture of the Somme; this he quitted in 1838 to enter the Council of State. The Revolution of 1848 was a heavy blow to him, Royalist and Liberal as he was in his political convictions; he remained, however, on the Council of State, and only relinquished his seat there after the *coup d'état* of 1851. Bitterly hostile to the Second Empire, as he had been to the First, he wrote a work directed against the new order of affairs. He died in Paris in 1862. Palgrave's *Dictionary of Political Economy*, from which our account is abridged, says of Dunoyer: "Dunoyer was one of the great economists of the nineteenth century. He wrote with much force in support of the theory of 'immaterial wealth,' even going so far as to say that, from the economic point of view, no 'wealth' could be other than 'immaterial.' He was a warm supporter of the theories of Malthus on population; but he was no believer in the theory of rent, considering that there was only one factor in production—*i.e.*, labor." He was elected, in 1832, a member of the Institute (*Académie des Sciences morales et politiques*), and in 1845 president of the Society of Political Economy. His miscellaneous works (*Notices d'économie sociale*), and the second edition of his chief work, *La Liberté du travail*, were published, both at the same time, in 1886.

EAST INDIA COMPANY, THE.—There have been various East India Companies—Dutch, French, etc. The English East India Company was chartered in 1600 as a "Governor and Company of Merchants trading to the East Indies." Its early voyages were like those of any company of the times, enjoying a monopoly of a certain trade. It had its rivals at home and abroad, especially with the Dutch. As early as 1602 it established a factory at Bantam; in 1690 it began the policy, commenced by the

Dutch, of defending its trade prerogatives by territorial possession. Its ensuing arbitrary measures caused it to be denounced at home, but it triumphed. A new company was formed, but it amalgamated with the old. The disruption of the Mogul Empire on the death of Aurangzeb, and the advance of the French, and the battle of Plassey (1757), under Clive, put the company in virtual possession of India. A creature of its own was put on the throne, but the real power was a council composed of the company's senior civil members. Later (1784), Lord Cornwallis as Governor-General gained the right

to overrule the council. Finally the great Indian Mutiny produced the feeling that so much power should not be left with a private company, and in 1858 India was transferred to the Crown. (See INDIA.)

EDEN, SIR FREDERICK MORTON (1766-1809), a graduate of Oxford, and chairman and one of the founders of the Globe Insurance Company ; wrote various statistical and other monographs, but is mainly known for his great work on the poor, which is described by its title, which is almost a catalogue : *The State of the Poor, an history of the labouring classes in England from the Conquest to the present period, in which are particularly considered their domestic economy with respect to diet, dress, fuel, and habitation, and the various plans which from time to time have been proposed and adopted for the relief of the poor, together with Parochial Reports relative to the administration of Workhouses, and Houses of Industry ; the state of Friendly Societies, and other public institutions, in several agricultural, commercial, and manufacturing districts*, with a large appendix (1797). A storehouse of information, it ranks with the travels of Arthur Young as one of the first sources of economic information for its period.

EDGEWORTH, FRANCIS YSIDRO, was born at Edgeworthstown, Ireland, in 1845. After several terms at Trinity College, Dublin, he entered Oxford in 1867, graduating with a "first class" in 1869. Devoting himself to mathematics, he published *Mathematical Physics* in 1881, and wrote numerous papers on statistical data for the British Association and other bodies. He lectured on political economy at the Ladies' Department of King's College, London, and in 1888 was appointed to a professorship of political economy in that college, and in 1890, on the resignation of the late Professor Thorold Rogers, to the Tooke Professorship of Economic Science and Statistics in the same university. He is Secretary of the British Economic Association, and editor of its *Journal*.

EDGEWORTH, MARIA, was born at Black Bourton in 1767, the daughter of R. L. Edgeworth. An intimate friend of Malthus, Richard Jones, and Ricardo, her writings aim to popularize and inculcate, among children especially, the main points of the orthodox school of political economy with its worship of "self-help" and individualism. Her *Belinda, Parents' Assistant, The Orphans, Moral Tales, Popular Tales, Rosamond, Egerton Abbey, Castle Rackrent* (1800), *The Absentee, Ennui, Ormond, Helen* (1834) are not all concerned with

economics directly, but point varied forms of the same general moral. She died in Edgeworthstown, Ireland, in 1849.

EDUCATION.—(See also INDUSTRIAL EDUCATION ; KINDERGARTENS ; UNIVERSITY EXTENSION, etc.) All schools of social reform are agreed that the importance of education in a true social development cannot be overestimated. The most thoroughgoing individualist, who would have the State play no part in education whatsoever, and the extremest socialist, who would have the State do all, do not differ in the value they put upon education itself. There are, indeed, those—and they are not a few—tho rarely found among the ranks of social reformers, who do not believe in a high degree of education for all classes. They hold that while mobility between classes should be easy, and there should be always a *carrière ouverte aux talents*, the majority of what is called the working class must always do the routine, mechanical drudgery of the world, and that for these classes much education simply unfits them for the work they have to do and gives them aspirations that can only bring unhappiness when they are not realized. Still another class of people oppose what is called the higher education of women, as unfitting them for home life and duties. Yet even these disbelievers in high education for all—and their number, it is to be feared, is not small even in so-called democratic America—are by no means disbelievers in education itself. They simply, on the principle of division of labor, believe that all classes do not need the highest branches of study.

Sociological discussions as to education, then, turn not upon its value, but upon the questions who should be educated, how far they should be educated, what a true education consists in, and what persons or institutions should conduct the education. We shall therefore in this article consider the subject under five heads :

I. What Education Consists in ; II. The History of Education ; III. Statistics of Education ; IV. Need of Educational Reforms ; V. Proposed Reforms. To sketch the outlines of pedagogics or the science of teaching does not come within the province of this work.

I. WHAT EDUCATION, CONSISTS IN.

Education (from Lat. *e* and *ducere*, to draw out) is usually defined as the process of developing or drawing out the faculties of the individual, or the training of human beings for the various functions of life. The thought is dwelt upon that education is not to cram a child's head with facts, to fill it with unassimilated information, but to draw out and develop the character and individuality, the mind, will, and soul-power of the pupil, to make him think and act for himself. But this, while always to be remembered, must not be carried too far. Education, as a matter of fact, does to a large extent and must to a large extent consist in imparting information, at least in teaching the pupil to acquire information. The informed man is not always educated, but the educated man must always be somewhat informed. He

does not, indeed, need to know, and it is impossible that he should know, everything on every subject, but a scholar has been defined as one who knows something about everything and everything about something.

Definitions. In the introductory chapter to his book, *The Education of the Greek People*, Mr. Thomas

Davidson says that education, "in so far as it depends upon conscious exertion, is that process by which a human being is enabled to transcend his original nature and attain his ideal nature, or be the most desirable thing that he can be. The end attained is his good." Mr. Davidson distinguishes here between two senses of the word nature. He shows that it may mean "the character or type with which a thing starts on its separate career, and which, without any effort on the part of that thing, but solely with the aid of natural forces, determines that career." Thus we speak of the nature of an acorn, a whelp, a cub. Or it may mean "that highest possible reality which a living thing, through a series of voluntary acts, originating within or without it, may be made to attain." Thus, through voluntary acts originating outside of them, a rose, an apple, a horse may be raised to a degree of perfection impossible for it by itself. Man, by voluntary acts, partly without the individual, but mainly within, can so rise to an ideal nature, to which his so-called "natural" instincts would never raise him. Says Mr. Davidson: "Nothing could be more prejudicial to the best interests of education than any attempt to evoke indiscriminately the tendencies of the child's original nature. Hence, all the popular talk about developing the child's 'spontaneity' is little more than sentimental cant, likely enough to do incalculable mischief." Nevertheless, it must not be forgotten that education is primarily the development of the individual, and that modern pedagogics more and more strive not to make the pupil informed, but to enable him to make good individual use of the information he acquires.

This means that education must proceed upon three main lines. Man's nature, original or ideal, is usually divided into three main facts—the constitution of his body, his mind, and his will. If education, then, be the development of man's original nature to the ideal, it must develop body, mind, affections, and will—that is, it must be physical, mental and moral, or religious. In the Greek and other early ideals of education this was remembered. Later in the Middle Ages, perhaps owing to the conception of Christianity which then obtained, the body was slighted and education made to consist mainly of mental and moral development. Beginning with the seventeenth century, owing again, perhaps, to the popular ideals of the divorce of Church and State, and to the taking of education from the hands of the Church, where it had been, and placing it in the hands of the State, the moral part of education was slighted and education left almost purely mental. Today, owing to the development of science, especially of biology, physiology, and sociology, men are seeing the reaction of body upon mind and mind upon body, and our schools, particularly our public schools, are paying much more

attention to the development of the body, sometimes, indeed, carrying this to an excess. The correlation of the mental and moral or ethical sciences is also to a greater or less extent seen and somewhat acted upon. Owing, however, to the conflicting and opposing ideas men have of religion and its connection with ethics and morals, the teaching of ethics may be called the unsolved problem of our public schools. "A sound mind in a sound body" was the Greek ideal. The development of the will was the Roman function. To develop mind and body and will and soul is the problem of modern pedagogics. Mr. Thomas Davidson, in the book above cited, *The Education of the Greek People*, published in the International Education Series (1894), gives us (chap. i.) one of the latest and most complete sketches of the educative process:

"When the human creature comes into the world, and for some time after, it is hardly more than an animal, with animal needs, and as such it has to be treated." The first step in education, then, should be to promote bodily health and ward off unfavorable influences. Warmth, sleep, and good digestion are then the three main needs. Soon the child begins to show intelligence. "It is now proceeding to build up its own world by means of selective attention, and this attention may be artificially divided and prolonged, so that a rational world shall result. At this stage the aims of the educator ought to be (1) to direct the child's attention to things on which it is well that attention should rest, and which yield impressions fitted to give a healthy fundamental tone and temper to the whole character; and (2) to sustain that attention as long as possible. . . . It ought, indeed, never to be forgotten that most of the difficulties with which education in its later stages has to contend are due to two causes: (1) the presence in the child's mind of undesirable and chaotic impressions, which have to be removed and corrected before an orderly world can be built up in it; (2) the absence of the power of continued attention, or, which is the same thing, the absence of power of will." Attention is best secured by action. Games should be selected with the greatest care. "In selecting objects upon which to direct the young child's wakening nature, the wise parent or teacher will bear in mind that the intellect has two closely allied functions: (1) to recognize distinctions and relations of fact; (2) to recognize distinctions and relations of worth. Bearing in mind, further, that the latter, being essentially the moral faculty, is the more important of the two, he will give preference to such objects and occupations as are calculated to fix the child's attention, not only upon relations of fact, but also and still more upon relations of worth." Physical culture, with a view to health, grace and ease of movement—nothing of the athletic habit—must at this time be developed. The kindergarten (*q.v.*) should aim at the above principles.

After the seventh year or thereabouts, instruction may largely take the place of training. The educator will now endeavor to acquaint the child with the rational grounds for those distinctions and corresponding actions with which his previous training has made him familiar, and to prepare the way for action of a wider scope, based upon rational knowledge. But these are the relations or laws of the universe. Into these the child must be initiated. To enable him to study these, the child must be taught the instruments of study:—(1) language, (2) number, and (3) manual facility. He must learn to read and write, to perform arithmetical operations, and practise one or more of the material arts. This last will give "(1) mechanical skill, (2) a habit of carefulness and thoughtfulness, closely akin to conscientiousness, and (3) a knowledge of the forms of things, and a sense of the adaptation of means to ends, such as could hardly be obtained in any other way." Then the child can acquire the elements of the natural sciences, beginning with the more mechanical, and also learn their spiritual meaning, studying grammar, logic, esthetics, ethics, and religion. Under grammar is included all linguistic study; under logic, ideology; under esthetics, the theory

Outline of Education.

and to some extent the practice of the spiritual arts ; under ethics, morals, politics, the history of civilization, pedagogics, the social sciences ; under religion, the laws of the spiritual sense, and of the world of which it supplies the material. Every branch of study ought to be both a science and an art, calling into play, not only the passive and receptive faculties, but also the active and creative ones. Mr. Davidson divides the time of education into five periods, to vary, of course, with individuals and with circumstances :

First period, seven years, family and kindergarten ; second period, three years, primary school ; third period, four years, grammar school ; fourth period, four years, high school or gymnasium ; fifth period, four years, university, with fixed curriculum.

The first period will aim at developing the physical and moral faculties, and the power of fixing attention. The second will be occupied chiefly with learning the

Periods in Education.

use of the instruments of study. The third will make the growing boy and girl familiar with their own mental processes, and with general notions of the world. Memorizing should be now much developed. Physical exercises should take a gymnastic form. The

fourth period—a difficult one—should develop a good deal of vigor, energetic emotion, and strength of will. Art, poetry, and romance should be studied. Games demanding endurance and courage should be chosen. The fifth period should aim to round off the development of the individual and teach the philosophies of life and of the world. Oratory and writing should be studied, developing modesty with power. Physically quiet endurance rather than violent exercise should now be sought. The college life should not consist largely of voluntary studies. The study of the specialist must come after this general education has been finished.

II. THE HISTORY OF EDUCATION.*

Tho its beginnings were prehistoric and its roots in the family, yet the real history of education dates from a comparatively recent period.

Owing to the spirit of caste and to pantheism, the Hindu ideal in education was contempt for life and self-repression rather than the cultivation of individuality. The great reform of Buddhism made little change in this, since Buddha also taught the extreme of self-abnegation. The Brahmins had full control of education among the Hindus, and woman was not admitted to share in its benefits.

Earliest Education.

Chinese education is peculiar for its formalism ; and such as it is to-day it has been for ages. It is thoroughly superficial. But in the matter of the wide diffusion of education it has been asserted that the Chinese lead the world.

In ancient Egypt education reached the highest level ; but learning was monopolized by the priestly class, and the common people learned little but the necessary arts of life.

Dittes says (*Histoire de l'Éducation et de l'Instruction*, translated by Redolfi, p. 49) : " If ever a people has demonstrated the power of education it is the people of Israel." During centuries of exile from their own country the preservation of their faith and manners has no doubt been greatly aided by their system of education. Hebrew education, however, was domestic. The ideal was the service of Jehovah. Moral and religious instruction was thus the chief part of education. Only boys were

taught to read and write. The events of the national history were repeated by the fathers to the children, and this in itself aroused patriotism and religious emotion. From the first century after Christ Jewish education became public as well as domestic. Boys then began to go to school at the age of six. They learned reading and writing, grammar, astronomy, and some natural history. All knowledge of Gentile origin was kept out of the Jewish schools by the rabbis. The education was thus wholly lacking in the Greek culture of the world about them.

Education in Greece seems to have been mainly a spontaneous growth in a favored soil, tho it was also consciously directed by legislators and philosophers. In dealing with Greek education, Sparta and Athens must be considered separately. At Athens, the training of the mind as well as that of the body was aimed at ; at Sparta, the training of the body alone.

Greek Education.

The elementary instruction of the young Athenians of good family consisted of grammar, gymnastics, and music. The poor learned only reading, swimming, and trade. The organization of the schools of grammar and music was left to private enterprise, but the State directed the gymnasia. Those of adult years attended the schools of rhetoric and philosophy. It is especially to the schools of philosophy that modern education owes a debt both of general ideas and of method. In Plato's dialogues we have given the teaching of Socrates and his method, which was that of interrogation. In the *Republic* we have Plato's own ideal commonwealth and education ; in which, however, the subjection of the individual to the State is carried to an extreme. He establishes three castes in his ideal State, for each of which there is a minutely detailed scheme of instruction. Plato places a high value on gymnastics, but gives precedence to music, since, according to him, the soul forms and develops the body. Moral education, in Plato's system, is, above all, an education in art. The soul rises to the good through the beautiful. In the *Laws*, written in Plato's old age, he to some extent qualifies the theories of the *Republic*. Of Aristotle's theories of education we have only an imperfect record.

Education at Rome may be said to have been, till the conquest of Greece, of the Spartan type. After that period it was formed more and more on the Athenian model. Schools were not opened in Rome till toward the end of the third century B.C. Oratory became more and more prominent in Rome after the age of Augustus ; and we have in parts of Quintilian's *Institutes of Oratory* a real and valuable treatise on education. Roman literature is poor in material for educational study. The Romans seem never to have considered education as an affair of the State. Roman education, as compared with Greek, may be called *practical*. Each is a distinct type.

The education of the earliest generation of Christians was obtained in the pagan schools, in those great imperial academies which existed even down to the fifth century, which flourished

* Partly condensed from Canpayré's *History of Pedagogy*, translated by W. H. Payne.

in Europe, Asia, and Africa, and attained perhaps their highest development and efficiency in Gaul. The first attempt at a special education for Christians was made at Alexandria, developed by Clement and Origen. The later Latin fathers took a bolder stand, and rejected the suspicious aid of heathenism. Tertullian, Cyprian, and Jerome wished the antagonism between Christianity and paganism to be recognized from the earliest years, and even Augustine condemned with harshness the culture to which he owed so much of his power. Yet the Church favored education and instructed her parish priests to found and conduct schools. The stormy times of the early Middle Ages were little favorable to education. They were the Dark Ages. What intellectual light there was was in the monasteries. (See MONASTICISM.) Yet for the most part this was limited and fettered by ecclesiastical traditionalism, developing at best the philosophy of the schoolmen.

A most important part of the monastery was the writing-room, where missals, psalters, and breviaries were copied and illuminated, and too often a masterpiece of classic literature was effaced to make room

Middle Ages. for a treatise of one of the fathers or the sermon of an abbot. Yet the monasteries of Monte Cassino,

Fulda, or Tours did not a little to educate their times and to preserve much that otherwise would have been lost. The seven arts of monkish training were grammar, dialectics, rhetoric, music, arithmetic, geometry, astronomy, which together formed the *trivium* and *quadrivium*, the seven years' course. One of the earliest treatises based on this method was that of Martianus Capella, who in 470 published his *Satyra*, in nine books. The first two were devoted to the marriage between Philology and Mercury, the last seven were each devoted to the consideration of one of these liberal arts. Cassiodorus, who wrote *De Septem Disciplinis* about 500, was also largely used as a text-book in the schools. The Saracens in Spain meanwhile, and the Greeks in the Byzantine Empire, had preserved ancient learning, if their schools developed little new thought.

The ninth century saw beginnings of intellectual life. In the twelfth century universities began to develop out of the schools attached to the cathedrals and monasteries. When a teacher of eminence like Abelard, or Peter the Lombard at Paris, or Irenæus at Bologna, appeared, students would flock around him. The members of the *studium generale* would form themselves for mutual support into a corporation called a university. The University of Paris existed as a separate body as early as 1169. Toward the end of the thirteenth century Pope Nicholas I. granted it the right of endowing its graduates with the power of teaching everywhere. It had at first only a faculty of arts, divided into four nations, known as French, Picard, Norman, and German or English. Faculties of theology, medicine, and canon law were added in the seventeenth century. The college of the Sorbonne, founded in 1250, became identified with the faculty of theology. The University of Bologna devoted itself mainly to law, and numbered 12,000 students at the end of

the twelfth century. It claims to be the oldest.

"According to the *Minerva Jahrbuch der Universitäten der Welt*, the following are the dates of origin of the older universities: 1119, Bologna, Italy; 1180, Montpellier, France; 1200, Paris, France; 1206 or 1249, Oxford, England; 1209, Valencia, Spain; 1222, Padua, Italy; 1224, Naples, Italy; 1229, Toulouse, France; 1230 or 1250, Salamanca, Spain; 1257, Cambridge, England; 1264, Ferrara, Italy; 1290, Coimbra, Portugal; before 1300, Lyons, France; 1303, Rome, Italy; 1307, Perugia, Italy; 1316, Pisa, Italy; 1339, Grenoble, France; 1346, Valladolid, Spain; 1347 or 1348, Prague, Bohemia, Austria; 1361, Pavia, Italy; 1364, Cracow, Poland, Austria; 1365, Vienna, Austria; 1386, Heidelberg, Baden, Germany; 1402, Würzburg, Bavaria, Germany; 1404, Turin, Italy; 1409, Aix, France; 1411, St. Andrews, Scotland; 1419, Rostock, Mecklenburg, Germany; 1426, Louvain, Belgium; 1431, Poitiers, France; 1433, Caen, France; 1438, Florence, Italy; 1445, Catania, Sicily, Italy; 1450, Barcelona, Spain; 1450 or 1451, Glasgow, Scotland.

There was, too, at least one development of popular education. Among the Brethren of the Common Life (*q.v.*), who were found in the Northern Netherlands, education was for all. The metropolis of their organization was Deventer, the best-known name among them that of Gerhard Groote. They devoted themselves with all humility and self-sacrifice to the education of children. Their schools were crowded. Boisdue numbered 1200 pupils, Zwolle 1500. For 100 years no part of Europe shone with a brighter lustre.

But already Europe was preparing for the revival of learning. The conquest of Constantinople by the Turks drove Greek teachers and their books from that city to Italy. The invention of printing made books accessible for all. The Renaissance preceded the Reformation. Through all Western Europe the "new learning" made schools popular. Vittorino da Feltre may be taken as a type of the teachers among the nobles of this era. He seems to have reached the highest point of excellence as a schoolmaster of the Italian Renaissance.

Thus there came the dawning of that intellectual day which was to make the sixteenth century an epoch in the history of human thought and aspiration. The mind awoke to intuitions concerning development according to natural laws, and to a conception and hope of independence and progress. Erasmus, Montaigne, Rabelais, Calvin, and Melanchthon did much to open long-blinded eyes. They brought the schoolmaster into the cottage, and laid the foundations of the system which is the chief honor and strength of modern Germany—a system by which the child of the peasant, by slow but certain gradations, receives the best education which the country can afford. Melanchthon, from his editions of school books and his practical labors in education, earned the title of *Præceptor Germaniæ*. Aristotle had been dethroned from his preeminence in the schools, and Melanchthon attempted to supply his place. He wrote elementary books on each department of the *trivium*—grammar, dialectic, and rhetoric. He made some way with the studies of the *quadrivium*, and wrote *Initia doctrinæ Physicæ*, a primer of physical science. He lectured at the University of Wittenberg, and for 10 years, from 1519–29, kept a *schola privata*

in his own house. The so-called Latin school, the parent of the gymnasium and the lyceum, spread all over Europe, and was especially flourishing in Germany. The programs and time-tables in use in these establishments have come down to us, and we possess notices of the lives and labors of many of the earliest teachers. One school stands preeminent before the rest. Strasburg educated the gilded youth of the sixteenth century under Sturm, as it trained the statesmen and diplomatists of the eighteenth under Koch. John Sturm, of Strasburg, was the friend of Ascham, the author of the *Schoolmaster*, and the tutor of Queen Elizabeth. He drew his scholars from the whole of Europe; Portugal, Poland, England sent their contingent to his halls. In 1578 his school numbered several thousand students; he supplied at once the place of the cloister and the castle. His pupils would write elegant letters, deliver elegant Latin speeches, be familiar, if not with the thoughts, at least with the language of the ancients. The Public School Commission of 1862 found that the lines laid down by the great citizen of Strasburg and copied by his admirers had remained unchanged until within the memory of the present generation.

John Amos Comenius was the antithesis to Sturm. Born a Moravian, he passed a wandering life in poverty and obscurity. But his ideas were accepted by the most advanced thinkers of the age. His school books were spread throughout Europe. The *Janua Linguarum Reserata* was translated into twelve European and several Asiatic languages.

Progressive educators of our time echo the words of Comenius when he urges the instruction of the young, "not by beating into them a mass of words, sentences, and opinions gathered out of books, but by opening their understanding through things themselves."

The Protestant schools were now the best in Europe. Catholics would have remained behind in the race if it had not been for the Jesuits. Ignatius Loyola developed numerous schools through

The Jesuits. the order which he founded, and the program of studies, which dates from the end of the sixteenth century, is in use, with certain modifications, in English Jesuit schools at the present day. In 1550 the first Jesuit school was opened in Germany; in 1700 the order possessed 612 colleges, 157 normal schools, 59 novitiates, 340 residences, 200 missions, 29 professed homes, and 24 universities. The College of Clermont had 3000 students in 1695. Every Jesuit college was divided into two parts, the one for higher, the other for lower education—the *studia superiora* and the *studia inferiora*. The *studia inferiora*, answering to the modern gymnasium, was divided into five classes. The first three were classes of grammar (rudiments), grammar (accidence), and syntax, the last two humanity and rhetoric. The motto of the schools was *lege, scribe, loquere*—you must learn not only to read and write a dead language, but to talk. Purism was even more exaggerated than by Sturm. No word might be used which did not rest upon a special authority. The order disdained history, science, and philosophy, their

labors being wholly directed to the propagation of the Catholic faith, and the ability to write in Latin in the most approved way.

It is impossible to estimate the influence of the Jesuits upon the world's civilization. They controlled during 200 years over 600 colleges and many universities, a control lasting till almost the end of the eighteenth century. They cared not so much for education as for the power to be gained by having the schools in their hands. In 1831 Roothar, the general of their order, somewhat improved their curriculums, but modern governments have on the whole done well to oppose these schools. They taught the accomplishments the polite world wanted, but stifled thought and inquiry. Montaigne, Locke, and Milton all criticised this form of education, and gave us stimulating and suggestive thoughts. Milton's *Tractate of Education* is most important. Meanwhile at Port Royal, in France, the Jansenists, Arnauld, Lancelot, and Nicoll taught with such success that they excited the jealousy of the Jesuits, and they were suppressed.

Pascal, Racine, and the Mère Angélique show what was their success. The *Port Royal Logic*, *General Grammar*, *Greek, Latin, Italian*, and *Spanish Grammars*, the *Garden of Greek Roots*, which taught Greek to Gibbon, the *Port Royal Geometry*, and their translations of the classics held their place for over a century.

We come now to the great name of August Hermann Francke, the founder of the school of Pietists, and of a number of institutions which now form almost a suburb of the town of Halle, to which his labors were devoted. The first scenes of his activity were Leipzig and Dresden; but in 1692, at the age of 29, he was made pastor of Glaucha, near Halle, and professor in the newly established university. Three years later he commenced his poor school with a capital of seven guilders, which he found in the poor-box of his house. At his death in 1727 he left behind him the following institutions: a *pädagogium*, or training college, with 82 scholars and 70 teachers receiving education, and attendants; the Latin school of the orphan asylum, with 3 inspectors, 32 teachers, 400 scholars, and 10 servants; the German town schools, with 4 inspectors, 98 male teachers, 8 female, and 1725 boys and girls. The establishment for orphan children contained 100 boys, 34 girls, and 10 attendants. A cheap public dining-table was attended by 255 students and 360 poor scholars, and besides this there was an apothecary's and a bookseller's shop. Francke's principles of education were strictly religious. The Franckesche Stiftungen are still, next to the university, the center of the intellectual life of Halle, and the different schools which they contain give instruction to 3500 children.

The *Emile* of Rousseau was published in 1762. It produced a profound impression, and has affected teaching until very recent times. With him nature is supreme. He protests against the shams of government and civilization, and pities the sorrows of the poor. He lays great stress on the earliest education. The first year of life is in every respect the most important. Nature must be closely followed. The chief moral principle is, *do no one*

Rousseau.

harm. Émile is to be taught by the real things of life, by observation and experience. At twelve years old he is scarcely to know what a book is; to be able to read and write at fifteen is quite enough. Then a new stage opens, when he is to learn history, science, and the machinery of society. Basedow, a friend of Goethe and Lavater, founded a school somewhat on these principles at Dessau, and later Salzmann did the same at Schnepfenthal. It was the age of romanticism.

The end of the eighteenth century saw a great development given to classical studies. The names of Cellarius, Gesner, Ernesti, and Heyne are perhaps more celebrated as scholars than as schoolmasters. To them we owe the great importance attached to the study of the classics, both on the Continent and in England. They brought into the schools the philology which F. A. Wolf had organized for the universities. Johann Heinrich Pestalozzi reverted to concrete education from objects. Born at Zurich in 1745, he converted his house into an orphan asylum: he saved from degradation over 100 children and issued volumes on education. He died in 1827 near Basle, overwhelmed with mortification; but to-day his ideas of training rather than instruction are accepted in elementary schools all over Europe. Froebel (*q.v.*) continued his work. He made many mistakes before fixing upon his final vocation, and even this proved a failure so far as he personally was concerned. He also, a victim to great griefs, died believing that his life had been lived wholly in vain.

It is with the kindergarten (*q.v.*) that we associate the name of this savior of little children. To him the child was a plant and the school its nursery. Tho much of the seed which he sowed fell in stony places, much also fell on good ground and has brought forth fruit abundantly.

Among modern contributors to the methods of education the names of Herbert Spencer (*q.v.*) and Alexander Bain hold a high place. Mr. Huxley did a great deal toward teaching exact science in a popular way. The name of Arnold will always be remembered in England as the ideal of a great head master. But already are we in modern times.

In the United States the school was planted side by side with the Church. The colony of Massachusetts gave a grant for a college which

The United States.

later was to become Harvard University, in 1636. An ordinance for common schools was passed in 1642. Connecticut that same year made an appropriation for schools already established.

The first institutions of secondary instruction founded in America were modeled on the "public or foundation schools of England." Boston, Cambridge, Dorchester, Salem, Ipswich, and Hadley, of Massachusetts, and Hartford and New Haven had so-called grammar schools established in the seventeenth century. Their primary design was to fit students for college. They were supported both from the public fund and from endowments, as well as from small tuition fees. Ezekiel Cheever, of New Haven, the most distinguished of New England's early teachers, was paid £20, and later £30 a year.

The clergymen, however, did most of the preparing of students for the colleges.

In 1746 Samuel Moody graduated at Harvard College, and at once began his career as a teacher in the York Grammar School of Maine. His school at York, tho the only public school in town, became the resort of scholars. In 1763 was founded the Dummer School at Byfield, Mass., the first of the New England academies, and to it Master Moody was transferred.

Phillips Academy at Andover and Phillips Exeter Academy were founded by members of the family whose name they bear in 1778 and 1782; and they have for a century been regarded as among the best schools in America preparatory for college.

Connecticut was the first of the States to establish a common-school fund. This was done in 1795. New York followed in 1805, and Massachusetts in 1834. A national land ordinance of 1785 dedicated one thirty-sixth part of the western territory then in possession of the Government to common schools. Down to 1883 the Government had granted for common schools 67,893,919 acres; for agricultural and mechanical colleges, 9,600,000; for seminaries or universities, 1,395,920; to be valued at some \$250,000,000.

Common Schools.

But by the side of the academy has arisen since 1840 in New England a public school, like the early grammar school, designed to prepare students for college. It is now almost universally known as the high school.

Throughout the West, at the time of its settlement, the high school became the chief institution of intermediate instruction. The number of schools of this grade changes from year to year, and also with important changes in the school laws, but nearly all towns of Western States of 15,000 or more inhabitants have schools in which the classical studies and the mathematics necessary for admission to college can be pursued.

In 1857 the National Teachers' Association was organized, and reorganized in 1870 as the National Educational Association. Its object is "to elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States." Any person in any way connected with the work of education, or any educational association, is eligible to membership. The National Council of Education consists of 60 members, selected out of the membership of the National Educational Association. The association has 200 life members and an average of about 4000 annual members.

In 1867 a national department of education was established, reduced the following year to a Bureau of Education. Education plays from the first a growing part in the State constitutions, but after 1837 it becomes very prominent. The first normal school dates from 1840, erected at Bridgewater, and was due to the efforts of Horace Mann (*q.v.*).

There being no system controlled by the National Government, diversity obtains in the different States, and yet there is a remarkable similarity. The funds are primarily raised by

local taxation, and when there is a State Educational Fund it is divided among the communities in proportion to their needs as a supplement, never as a substitute. The State law fixes the grades of study, the minimum length of term, and where compulsory attendance prevails makes additional regulations. Each town or city chooses its own school board, to which it entrusts the organization and management of the schools. In most States (in Philadelphia since 1820, New York since 1840, and Massachusetts since 1873) school books are provided free to the scholars. The Boston School Committee in 1887 declared that the free text-book has undoubtedly been a large factor in filling our high schools and the upper classes of the grammar schools.

In the development of colleges and universities Americans have not been backward, mainly established on voluntary lines by the gifts of successful business men, tho of late State universities are being more developed. John Harvard, dying in 1638, gave half his property for the establishment of Harvard College.

William and Mary College was established in Virginia by a grant from the English Government in 1693. Yale College was established in 1700, Princeton in 1746, Kings (now Columbia) College in 1754, Brown University in 1764. Some of these have now grown into universities, but most of America's colleges are not universities. Many of them are on denominational foundations. The salaries, compared with the wealth of the country, are small. Small opportunities for research have until recently existed. But Johns Hopkins University, established in 1876, has led in this, and fellowships established at Harvard, Columbia, Pennsylvania, Chicago, and elsewhere are developing much post-graduate study. Women's colleges, commencing with Vassar College, in 1861, are now multiplying.

Mr. Bryce, in his *The American Commonwealth*, says of American colleges :

"In America the universities are not a well-defined class of institutions. Not only is the distance between the best and the worst greater than that which in Germany separates Leipzig from Rostock, or in England Cambridge from Durham, but the gradations from the best down to the worst are so imperceptible that one can nowhere draw a line and say that here the true university stops and the pretentious school begins. As has been observed already, a large number present the external seeming and organization—the skeleton plan, so to speak—of a university with the actual performance of a rather raw school. . . .

"Not the least interesting of the phenomena of today is the struggle which goes in the Middle and Western States between the greater, and especially the State universities, and the small denominational colleges. The latter, which used to have the field to themselves, are now afraid of being driven off it by the growth of the former, and are redoubling their exertions not only to increase their own resources and students, but—at least in some States—to prevent the State university from obtaining larger grants from the State treasury. They allege that the unsectarian character of the State establishments, as well as the freedom allowed to their students, makes them less capable of giving a moral and religious training. But as the graduates of the State universities become numerous in the legislatures and influential generally, and as it is more and more clearly seen that the small colleges cannot, for want of funds, provide the various appliances—libraries, museums, laboratories, and so forth—which universities need, the balance seems likely to incline in favor of the State universities. It is probable that while these will rise toward the level

of their Eastern sisters, many of the denominational colleges will subside into the position of places of preparatory training.

"One praise which has often been given to the universities of Scotland may be given to those of America. While the German universities have been popular, but not free, while the English universities have been free, but not popular, the American universities have been both free and popular. . . . One who recalls the history of the West during the last 50 years, and bears in mind the tremendous rush of ability and energy toward a purely material development which has marked its people, will feel that this uncontrolled freedom of teaching, this multiplication of small institutions, have done for the country a work which a few State-regulated universities might have failed to do. The higher learning is in no danger. The great universities of the East, as well as one or two in the West, are already beginning to rival the ancient universities of Europe. They will soon have far greater funds at their command with which to move toward the same ideal as Germany sets before herself; and they have already what is better than funds—an ardor and industry among the teachers which equals that displayed 50 years ago in Germany by the foremost men of the generation which raised the German schools to their glorious pre-eminence."

III. STATISTICS OF EDUCATION.

(a) THE UNITED STATES.

The report on education in the eleventh census states elaborate reasons why statistics as to education for many of the States must be taken with reserve, and since determined on different bases in different States and at different periods must not be too blindly used in making comparisons and drawing conclusions. It says :

"Education appears for the first time in census tables of the United States in 1840, so that the census reports on that subject now cover a period of 50 years.

"The conditions in 1840 were such that the classification adopted roughly suggests the number who might respectively be classed as elementary, secondary, and superior in their lines of study. It is highly probable that the very small number of special institutions then existing under private or public beneficence were included in the general summaries. Such institutions in recent census years have been grouped by themselves. In the report of 1840 merely the number of pupils was given, without sex or color. The nation expected but one race to attend school. For Massachusetts alone the number in elementary schools and the number at public charge approached agreement. At that time Massachusetts was almost singly conspicuous in the general maintenance of free schools.

"It is claimed that in 1840 a union graded free public school was organized in central New York, and in 1842 a similar step was taken at Detroit, Michigan. Whatever may be the credit due for leading in this widening of the public free school, there was between 1840 and 1850 a very rapid development westward of schools depending on local taxation for support. For a time many of these schools derived some assistance from tuition fees, not only of non-residents, as is still the general practice, but of all pupils, a custom not yet wholly discontinued. The tables for 1850 indicate the growing prominence of public schools, but in the change of conditions the classification does not so fully indicate the range of work as in the returns of 1840.

"The table for 1860 illustrates the continued growth of the public free-school sentiment north of the general line suggested by the Ohio River, with a marked modification in Indiana, where the authority to levy adequate local taxation was delayed yet later by reason of a decision of the State Supreme Court.

"The table for 1870 indicates social changes as compared with the table for 1860. The great civil war had intervened, the public schools in the older Northern States had passed the stage of rapid growth belonging to new popular institutions, and their enlargement approximated the variations in population more than in the previous decades. In this decade, however, there were indications of the growth of the public school southward. This new growth must not be mistaken for the inauguration of public schools. The large cities of the South had efficient public schools

long before, and all States from Alabama westward formed from the public domain were organized like the oldest States of the Northwest, with a division into Congressional townships and the grant of a section or square mile of land in each township for school purposes. The public schools of the South, like the earlier public schools of the North, appear in 1870 largely dependent on tuition fees and other private resources.

"The table for 1880, unfortunately, contains only the record for public common schools, the Census Office having been closed before the material gathered for private schools and for superior public institutions was ready for publication. The growth of public schools in the South was very great in the decade, as well as in newly settled portions of the North. The colored element, almost unschooled in earlier decades, begins to appear in the returns of public school attendance.

"The summary table for 1890 shows a continued growth of public schools in the South and West, and among the old Northern States a relative decline as compared with population, resulting for the whole country in a growth slightly greater in proportion than the growth of population. Were we able to compare the enrolment in all schools in both decades, it is quite possible that the gain in private schools, including the parochial schools, would exceed the apparent local decline in public school enrolment, so that no indication of decline in general education would appear. The unfortunate failure to reach results for private schools in 1880 prevents any authoritative comparison with that year.

The following table presents the general changes that have apparently taken place in 50 years by decades:

PUPILS ENROLLED IN SCHOOLS, NOT INCLUDING ALASKA, EXCLUSIVE (FOR RECENT DECADES) OF SPECIAL CLASSES, REFORMATORY, CHARITABLE, AND INDIAN SCHOOLS.

ITEMS.	1890.	1880.	1870.	1860.	1850.	1840.
Population	62,622,250	50,155,783	38,558,371	31,443,321	23,191,876	17,069,453
All schools	14,371,893	7,210,420	5,477,037	3,642,694	2,025,656
Primary and common, 1840; public, 1850, etc.*	12,768,965†	9,951,608	6,228,060	4,955,894	3,354,173	1,845,264

The errors in all the years seem to have had a fairly uniform influence, apparently partly due to the constancy of local conditions. The variations of school age and methods of administration must modify the value of any comparisons between two States. Great local changes adjust themselves into a moderate general effect. In illustration, compare the twenty years from 1850 to 1870, and the twenty years from 1870 to 1890. Population apparently increased in the first interval 66.26 per cent. and in the second 62.41 per cent. The total school enrolment seems to have increased 97.94 per cent. between 1850 and 1870, and

99.32 per cent. between 1870 and 1890, rates nearly identical.

NOMINAL AVERAGE LENGTH OF SCHOOL TERM IN DAYS FOR EACH STATE AND GROUP OF STATES AND FOR THE UNITED STATES.

United States.	20,999,383	13,960,288	9,208,896	388,531

The average length of school term in the United States was 139 days. The whole number of male teachers was 125,317; female teachers, 263,214; paid for salaries of superintendents and teachers, \$108,476,638; total expenditures, \$170,639,081.

(b) OTHER COUNTRIES.

In Great Britain the highest education is furnished by the universities and detached colleges. Oxford, Cambridge, Durham, Owens College (Manchester), the Scotch universities, and Trinity and Queen's in Ireland, are of various dates; the rest are quite new. In 1894 Oxford had 23 colleges; Cambridge, 19; there were 16 other colleges in England and Wales; 6 in Scotland, and 4 in

Great Britain. Ireland There were in these 68 colleges 1361 teachers, of whom Oxford and Cambridge had 93 each; Kings College, London, 140; London University (which is only an examining body, with power to grant degrees), 105; Glasgow, 89; and Dublin University, 64. There were 21,167 students, of which Oxford had 3256 (undergraduates); Cambridge, 2839; Newcastle, 2164 (in 1892, including evening students); London University, 1093 (exclusive of its schools); Kings College, London, 480 (and evening schools of about 4000); Edinburgh, 2949; Glasgow, 1878; Dublin, 1124. There are four university colleges for women: Newnham (Cambridge) and Girton College and Lady Margaret and Somerville Halls (Oxford), and a college in London and one in Edinburgh, with about 600 students in all. There are also various technical, medical, agricultural, and other institutions,

but which, like the middle-class schools, are entirely unorganized and of which no reliable statistics are available. Middle-class education in England is almost entirely in private hands. Of elementary education the *Statesman's Year Book* for 1895, from which the above statistics are taken, says:

"Up to the beginning of this century elementary education in England was left almost entirely to the care of the clergy of the Established Church. In 1803 the British and Foreign School Society was founded, and in 1811 the National School Society, the latter being under the authority of the Church. In 1833 Parliament for the first time voted money to aid in the building of schools. In 1839 a Committee of Council on education was appointed to watch over the distribution of these subventions. In the same year normal schools began to be built and received aid from the Committee of Council. In 1846 subventions were first given to increase the salaries of teachers, and in 1847 Catholic schools were admitted to these benefits. In 1853 grants began to be given to schools according to the number of pupils in attendance, and in 1862 the grants were made to depend on examination results.

"The Elementary Education Act of 1870 and subsequent amending Acts now regulate elementary education in England and Wales. The central administrative authority resides in the Education Department or Committee of Council on Education, consisting of Lords of the Privy Council, with the President of the Privy Council as President, and a member of the Privy Council as Vice-President, who represents the department in the House of Commons. Sufficient school accommodation must be provided in every district for all the resident children between the ages of 5 and 14. The boroughs and parishes are, unless the educational requirements are otherwise supplied, formed or grouped into school districts, each with its elected school board, which may compel parents to send their children to school. In boroughs and parishes where school boards are not required school attendance committees are appointed to enforce the attendance of children. On April 1, 1893, there were in England and Wales 2331 school boards embracing a population of 18,764,565, and 781 school at-

tendance committees embracing a population of 10,277,961. The obligatory subjects are reading, writing, arithmetic, and (for boys) drawing, or (for girls) needlework. Optional subjects are singing, geography, science, algebra, modern languages, cookery, etc. In board schools unsectarian religious instruction is given; in voluntary schools sectarian doctrines may be inculcated. There are seven standards, and each pupil should pass one standard every year. When the fourth standard is passed, the child, if 12 years of age, may leave school. A 'code' providing in detail for the regulation of schools is annually prepared by the department and submitted to Parliament. In 1891, by a fee grant of 10s. for each child between 3 and 15 years of age in average attendance, to be paid on certain conditions to managers of public elementary schools, education was rendered practically free in England and Wales. On June 1, 1893, there were 19,534 schools receiving the fee grant, and only 142 schools had refused it."

As to compulsory education, says a Fabian tract :

"The provisions of the Act of 1870 were very lax as to compulsory attendance. Six years later a law stated distinctly that the parent should be bound under penalties to cause his child to receive elementary education, and empowered School Boards and School Attendance Committees to make by-laws and to enforce the compulsory clauses; but not until 1880 were these bodies left without choice, and compelled to make and to profess to administer local rules for getting the youngsters to school. As it stands the law is very complicated, and varies from district to district. A child may work half-time either inside or outside a factory at 11 years of age. In both cases he must pass the Standard for partial exemption (usually the third) fixed by the local by-laws. In 1200 districts a proficiency qualification is practically not enforced, 'the hole is so big that it will admit almost everybody except an idiot.' In a few places full-time employment outside a factory or workshop may also commence at 11."

On August 31, 1894, there were in England and Wales 5151 Board schools, 11,897 National Society schools, 503 Wesleyan, 985 Roman Catholic, 1229 others. There were 50,689 certified teachers, 26,067 assistant, and 28,379 pupil teachers.

The question of Board schools *vs.* Church schools in England is "a burning question." Tho there is an active minority among them that favor Board schools, the majority of the Anglican clergy are bitterly opposed to them. They strive to keep education just so far as possible in the hands of the Church. They advocate and largely obtain the giving of school funds to the support of Church schools, divided among the various religious bodies in proportion to their strength. They consider Board schools atheistic and immoral. The intensity of feeling on this point enters into and turns many local elections. Complaints against this system are incessant. Says a Fabian tract :

"Fourteen thousand six hundred and eighty-four day schools, attended by 2,300,000 children, are yet under private management. In many towns and districts not a single school under public control exists; and even in big towns, where school boards are energetically at work, their denominational rivals stubbornly survive. If these privately managed institutions were entirely supported by their pious patrons there would be little ground for agitation. But the British taxpayer is compelled to find nearly four fifths of their funds, tho, like the stupid, easy-going fellow he is, he permits the so-called 'voluntary' subscribers of the one fifth to control the schools.

In the majority of instances the clergyman of the parish is practically the manager of the State-supported voluntary school. He appoints the teachers and fixes their salaries, regulates the supply of school materials, superintends the religious instruction, and kindly supervises the teachers' manners. . . .

"The chief blot on English education is the chaos

which prevails above the primary schools. On each of the three occasions when Matthew Arnold examined and reported upon Continental systems of education, he implored the English Government to organize Secondary and Higher Education. That was always the burden of his educational song. His case could not be refuted. . . . Secondary education is the Arcadia of private unregulated enterprise. Men who have been driven out of other callings imagine that Heaven intended them to manage a private school. Their entrance to the trade (it is not recognized as a profession) is charmingly easy. No apprenticeship, experience, certificate, or proof of aptitude is required. They put mysterious letters after their names to which no educational body can attach a meaning; they issue delusive prospectuses; they lure shabby-genteel people into their parlors; and the thing is done."

The Board schools, however, are gaining because they are usually better, and the progress toward popular education is marked. Says the *Labor Annual* for 1895 :

"The National Union of Teachers, numbering 25,000, met in Annual Conference this year for the first time at Oxford, and resolved that the granting of teachers' certificates should be placed in the hands of an Educational Council on which primary teachers should be adequately represented. Further resolutions urging the registration of teachers, formation of a Ministry of Education, and the appointment of practical men as inspectors were also passed. The National Union of Teachers is destined to be the future Educational Department under Collectivism, superseding the present objectionable 'patchwork system.'

"The President advocated the formation of District Boards of Education throughout the country, to control all primary and secondary work. The grant from Imperial sources to such boards should be a fixed amount per head of the school population—*i.e.*, of the number that ought to be in the school—paid quarterly, and of sufficient amount, when added to the receipts from local rates, to secure efficiency in every school, whatever its difficulties or needs. Strict annual audits of pre-estimated costs, termination of the school year at the same date, a real inspector and adviser, and a qualifying instead of an annual pass from class to class would bring about the desired popular control. His 'local control' proposals were reaffirmed by the Conference.

"Popular anticipations with regard to the Assisted Elementary Education Act of 1891 have been fulfilled, and the years-long Socialist agitation for Free Education more than justified. The number of scholars on the registers rose from 4,824,623 in 1891 to 5,126,373 in 1893, an increase of nearly 25 per cent., the average attendance increased by nearly 6 per cent., the cost per head was reduced by 34*d.*, and the Government grant, which spells efficiency, proportionately increased. Only 132 schools refused the Government grant in 1893, while of the 19,445 assisted ones, 15,914 were free schools. Thus there were 4,236,867 free scholars and only 889,506 free-paying children."

"In Scotland from 1595 to 1872 elementary education was regulated by the Act of James VI., which ordained that every parish should have a school supported by revenues derived from the land, the teachers being appointed on the recommendation of the Presbyterian ministers. By the Elementary Education Act of 1872, the Scotch Education Department was instituted, and each burgh and parish or group of parishes was required to have a school board to administer both elementary and middle-class schools, and to enforce the attendance of children from 5 to 14 years of age. In 1889, by a capitation grant, education was made free for the compulsory standards; in 1891 an age limit, 5 to 14, was introduced" (*Statesman's Year Book*).

There were 3105 inspected schools in 1893, of which 2679 were public, free for the compulsory standards. The average attendance was 542,851. In Ireland there were, in 1893, 8459 schools, with an average attendance of 527,060. They were under the superintendence of a body

of "Commissioners of National Education in Ireland." Of 8418 schools inspected, 3833 were Roman Catholic and Protestant, 3485 non-Roman Catholic, and 1110 Protestant. (For the colonies, see AUSTRALIA; NEW ZEALAND.)

In France public education is entirely under the supervision of the government. The highest schools are called *facultés de l'État*. There are 15 *facultés des lettres*, 15 *facultés des sciences*, 15 *facultés de droit* (law), 7 *facultés de médecine*, 2 *facultés* of Protestant theology.

France.

In 1885 the Roman Catholic theological *facultés* were suppressed, but the Roman Catholic universities exist still on conditions. In 1896 there were 8782 students of law, 8685 of medicine, and 3076 of pharmacy. The budget of 1895 devoted \$2,546,463 to these *facultés*. There were also various special schools. Elementary schools were little developed till the middle of the century. In 1881 primary instruction was made free, and in 1882 obligatory for children from 6 to 13. In 1886 all schools were put under charge of laymen. In 1893-94 there were in France (and Algeria) 88,632 primary schools with 6,262,067 pupils; 70,037 of these schools were public. There were also 400 secondary public schools, with 95,877 pupils. The money spent obligatory and voluntary for elementary education in 1892 was \$37,260,000. The number of untaught children was 75,000.

The attendance law of France enacts that "primary instruction is obligatory for children of both sexes between the ages of 6 years complete and 13 years complete." The parent is summoned if the child is absent four half-days in a month. For repeated absences he may be fined 15 frs. or sent to jail for five days. However, the local authorities have power to grant individual children long holidays, and in practice the law is softened. No man may teach a primary school under the age of 18.

Education in Germany is practically homogeneous, under a national system beginning with the *Volksschulen*, or elementary schools.

Germany.

Then come the *Bürgerschulen* and the *Höhere Bürgerschulen*, which fit the pupils for business life. Children go to different grades of schools according to what the parents can pay. There are also *Fortbildungsschulen*, or continuation evening schools for children of the working classes. The *Gymnasias* are the fully developed classical schools preparing the pupil in nine years for the university. The *Progymnasias* do not have the highest classes. The *Real gymnasias* teach Latin, but not Greek, and devote more time to "modern subjects." In the *Realschulen* Latin is wholly displaced in favor of modern languages. There are also numerous *Gewerbeschulen*, or technical schools, polytechnic, normal schools, seminaries, etc. There were, in 1895, 434 *Gymnasias*, 86 *Progymnasias*, 130 *Real gymnasias*, 109 *Real progymnasias*, 33 *Oberrealschulen*, 171 *Realschulen*, and 93 other schools. The number of elementary schools was estimated at 56,560, with 7,925,000 pupils. The immediate expenditure on elementary schools was \$60,600,000, of which \$15,823,000 came from State funds. School at-

tendance is compulsory. Details vary in the empire, but usually the school age is from 6 to 14. There were, in 1894, 21 universities with 27,719 students. Of these 4979 were in Berlin (besides 3471 non-matriculated students), 3067 at Leipzig, 3408 at Munich, 1535 at Halle, 1383 at Bonn; 4573 studied theology, 7506 law, 8410 medicine, and 7230 philosophy.

Austria had, in 1892, 18,874 elementary schools, with 3,220,452 pupils, 176 *Gymnasias*, 76 *Realschulen*, and 8 universities with 13,383 students, 4919 being at Vienna. Hungary had 16,942 elementary schools, with 2,232,315 pupils, 153 *Gymnasias*, 33 *Realschulen*, and 3 universities, with 4661 students, 3604 at Budapest. There were also seven government technical high schools and 2121 special technical institutes in Austria with 449 in Hungary.

Austria.

In Switzerland there is no centralization of schools, but in all the cantons elementary education is compulsory and primary instruction free. Compulsory education is not, however, enforced in all the Roman Catholic cantons. There were 5 uni-
Switzerland.
versities, 174 professional and industrial schools, 38 normal schools, 485 secondary, 8391 primary and 679 infant schools in 1894. There were, in 1894, 2982 students in the 5 universities and the academies of Fribourg and Neuchâtel. Of these 1278 were foreigners.

In Neuchâtel attendance is compulsory up to 16 years of age; but after 13 only 10 hours a week are enforced. Berne demands five sixths of the possible attendances to be made between 6 and 15. At Zurich, the paradise of education, the law is equally stringent. Children must attend the primary school between 6 and 13, and the secondary school between 13 and 16, unless exempted for special reasons. But out of a population of 105,000 only 200 children who are less than 16 years old have left school. Attendance is required every day, and penalties are inflicted for 10 absences.

In Berne no one can teach under the age of 19, and in Zurich no one under 20. In all Switzerland the maximum number of pupils in a room is 50, and it is usually less. Definite instruction in the religion of the majority is given in the popular schools. An article in the Swiss Constitution commands that "the public schools shall be capable of being attended by adherents of all confessions without injury to their freedom of faith and conscience." No difficulty has arisen. Catholic instruction is given in Catholic cantons like Lucerne; Protestant in cantons like Zurich.

Sweden has 2 universities with 2084 students, and in 1893 had 75 public high schools, 25 people's high schools. In 1893 there were 10,889 elementary schools with 705,905 pupils. The expenditure for elementary schools was \$5,000,000, of which about one quarter came from the State. Norway in 1891 had 6144 public elementary schools with 232,356 pupils, and 1749 classes with 55,371 pupils. There were 82 public secondary schools with 11,044 pupils, and 86 private schools. There

Other Countries.

were 6 normal schools and 1 university. Education is compulsory.

Denmark has 2940 elementary schools with 231,940 pupils, 22 agricultural or horticultural schools, 67 high schools, 31 Latin schools, 99 commercial or technical schools, and several colleges. Elementary education has been compulsory since 1814. Russia had, in 1893, about 9 universities with 13,470 students, 22 higher schools, 618 middle class schools for boys, 373 for girls. In 1887 there were 46,880 elementary schools with 408,721 pupils. The total contribution for schools in 1894 was about \$30,000,000. These statistics, however, cannot be considered as complete.

In Holland education is not compulsory nor necessarily free. Education is, however, largely regulated and supported by the State. There are 4 universities, 152 intermediate schools, 2993 public elementary schools, 1331 private and 991 infant schools. Belgium has 4 universities, various special schools, 34 royal athenæums and colleges, 132 middle-class schools, 5777 private

schools, 1321 infant and 1796 adult schools. These are public, but there are many private schools and colleges, mainly under ecclesiastical care.

In Italy there were, in 1893-94, 21 universities with 19,441 students, 1693 special, superior, commercial, normal, and technical schools and colleges, 5946 evening schools, 46,569 public primary schools, 11,708 irregular or private primary schools, 2572 infant schools. Only the lower grade education is compulsory. Religious instruction is given when parents wish it. The instruction in all schools, public and private, is regulated by the State. The elementary schools are mainly supported by the communes. The universities are maintained by the State, other schools are aided.

The following table, from the Report of the United States Commissioner of Education for 1890-90, gives a comparative view of education in Europe and America between Kindergarten and university, arranged according to ratio of children in school :

COUNTRIES.	Date of Census or Estimate.	Population.	Date of Report.	Children Enrolled in School.	Ratio to Population.	Cost of Elementary Instruction per capita of Population.	Pay Tuition or not.
United States (entire).....	1890	62,622,250	1890	14,377,536	23.3	2.24	Free.

IV. NEED OF REFORM.

In the United States the most striking need of reform is in the largest cities. Says Professor Waetzoldt, of Berlin (quoted in the Report of the Commissioner of Education for 1892-93) :

"It is almost ludicrous to say that compulsory education is generally adopted in the United States. To understand that neglected children are not disposed to go to school, we must visit the labor quarters of cities like New York, Chicago, etc., and see the children come out of the factories. . . .

"According to authentic reports from New York, not more than 72 per cent. of all children who should go to school can be induced to do so; 28 per cent.—the street Arabs—never attend school. The greater number of these 72 per cent. attend only during three to four months of the year, and only about 30 per cent. go for four consecutive years. Statistics referring to these conditions, however, are always very imperfect. We naturally ask, 'What reason have children for staying away from school?' I have at hand the last school report from Chicago. The school year extends from one summer vacation to the other, from September till June, and the committee of investigation found that during the year 1891-92, 12,900 children missed school from insufficient causes; 9275 were notorious loafers and idlers, who could not be forced into school. Among these youths crime finds its recruits. The other 3730 cases are thus accounted for: 504 children did not go to school because they worked away from home; 362 were obliged to work at home; 571 were kept at home by parents disapproving of education; 25 because of physical deformities; 390 victims of poverty stayed at home for want of clothing. In all Chicago 32 only had private lessons at home; 879 were always sick; 395 were absent for unknown reasons; 65 were beyond the required age, tho still deficient in knowledge.

"As many as 1236 children never attended school on account of the indifference of their parents, the depravity of the father, or the incorrigibility of the children themselves. The reasons given for the latter were intemperance of parents, the father being away from home, or entire abandonment by both father and mother. Seventy-four boys, children between 12 and 14 years of age, declared that their fathers drank, smoked, and never came home at night; 500 boys were said to be in the house of correction; 100 in prison. These figures certainly show a very bad state of affairs; but we must remember that a city like Chicago grows by the influx of people from all parts of the earth, who are not always the worthiest. The following statements are much worse. In spite of all labor legislation and supervision of factories in the United States, certificates for permission to work are given to children who should be going to school. In Chicago, during one year, such certificates were given to 1077 children, 484 of whom were girls; 08 of these children were 10 years old; 115, 11 years old; 342, 12 years; and

522, 13 years old. The reasons why certificates for permission to work were given in these cases were because the children were poor, or orphans, or had been abandoned by parents, and, most frequently, that the boy might not become addicted to intemperance."

Of New York the *Outlook* of August 17, 1895, says :

"The recent conference of Good Government Clubs in the metropolis regarding the public schools brought out some astonishing and disgraceful facts. The average salary of teachers and supervisors in the public schools in New York is only \$677, as against \$762 in Brooklyn, \$780 in Chicago, \$808 in Cincinnati, \$883 in San Francisco, and \$1000 in Boston. The expense per head of the school population, from five to 21 years of age, is in the metropolis only \$6.08, as against \$6.74 in Cleveland, \$7 in Chicago, \$7.07 in Cincinnati, \$8.81 in San Francisco, and \$11.70 in Boston. The value of the school property per head of school population, from five to 21 years of age, is in New York only \$42.60, as against \$54.80 in San Francisco and \$81.18 in Boston. In New York City the number of children not in any school amounts to 38 per cent. of the school population, as against 30 per cent. in Boston."

Of Brooklyn, Mr. Maxwell, Superintendent of the Schools in that city, says :

"In order to ascertain the efficiency of the city school system, a test was recently made of the proficiency of pupils in the first, second, and third grammar grades. The subject of the examination was geometry, attention being paid also to the use of language made in the written papers. It was supposed that no subjects could have been chosen that would more thoroughly and justly reveal the worth of the instruction the pupils were receiving. The result of the examination is not one upon which the schools can be congratulated.

"The examination papers came from 172 classes. Of these the papers of only four were found 'very good,' 26 'good,' and 46 'fair,' while 55 were 'poor,' 16 'very poor,' and 25 'failures.' A majority of the pupils apparently did not know what an obtuse angle or an isosceles triangle is; their methods of demonstration were clumsy and indirect; they evidently depended more upon parrot-like memory than upon their reasoning powers; and their use of the English language was inaccurate, slovenly, and incoherent to a deplorable degree. These facts indicate unmistakably that both in quantity and in quality the instruction given is seriously at fault. The children are not taught many things which they should be taught, and they are taught few if any things in the right manner.

"The people of Brooklyn pay about \$2,000,000 a year for the education of about 100,000 children in the public schools, or \$20 a year for each child."

The fact is that neither in Brooklyn, New

York, Boston, nor Chicago is there seating capacity for all the children if they did attend. It is

generally admitted that one teacher cannot instruct with the best results

more than 35 or 40 pupils. Yet in

Lack of
Sittings. Brooklyn, in 1893, of 377 classes,

231 had between 60 and 70 pupils ;

65 between 70 and 80 ; 22 between

80 and 90 ; 18 between 90 and 100 ; 2 between

100 and 110 ; 16 between 120 and 130 ; 4 between

130 and 140 ; 2 between 140 and 150 ; 1 had 158 pupils. In 1894 only 1800 additional

sittings were offered to meet an annual increase

of 5000. The Report of the Committee on

School Houses in Boston in December, 1894,

describes the situation there as of "great public

exigency." High schools built to accommo-

date 150 suffice for 272 pupils. In Minneapolis,

of 16,000 children enrolled in the first three

grades, one third can receive only half day ses-

sions. In Philadelphia 8000 are similarly un-

careed for. In Milwaukee 2478 children. In 1893,

it was estimated that there were 35,000 persons

of school age who did not attend school, some

of them refused admission, and over 3000 pu-

pils were in unfit rented rooms.

In the *Forum* for 1892-93 is a series of studies

of the schools in the larger cities of the United

States by Mr. J. M. Rice. Summing up his

findings, he says (*Forum*, vol. xv., p. 506):

"In quite a number of cities the schools have

advanced so little that they may be regarded as

representing a stage of civilization before the age of steam

and electricity. In other cities we find schools that are

just awakening to the fact that progress has been

made in the spiritual as well as in the physical world,

and in still others we find schools that have already

advanced considerably along the line of progress. . . . My classification, however, applies more fully to the

primary than it does to the grammar

grades, as in the different cities the for-

mer vary much more markedly than

the latter. . . . The general educational

spirit of the country is progressive, the

schools of large numbers of our cities now laboring in

the right direction. But we must never forget that in

the United States each community conducts its schools

independently, so that the favorable condition of the

schools in one locality reflects absolutely no credit on

those who manage the schools of another locality." In

New York he finds schools "so unsanitary as to be unfit

for the habitation of human beings." "There is absolutely

no incentive to teach well. . . . A teacher scarcely

impairs her position by doing exceedingly poor

work. . . . Teachers are very rarely discharged even

for the grossest negligence and incompetency. . . . Nearly

all appointments are made by 'pulls,' merit

being a side issue." In Boston, he finds not these evils,

but others. The system is not mechanical. Teachers

are carefully selected, usually for merit, and allowed

liberty, under competent superintendents. The *per*

capita cost of instruction is particularly high. Some

of the grammar schools are among the best in the

country, but in the primary grades they fall "far

short of what they ought to be." They are "purely

mechanical drudgery schools." Boston schools were

once, Mr. Rice believes, among the best in the country.

Now "it would appear as if the Boston schools had

during this time been resting, meanwhile allowing

the progressive schools to run ahead." The schools of

Philadelphia are "a striking example of the difficulties

involved in advancing schools, when those in authority

use their offices for selfish purposes, . . . and . . . the

evils consequent upon a school system conducted with-

out a responsible head." The public schools of

Chicago are "not in advance of those of New York or

Philadelphia," and even "the least progressive of the

three." The principal cause of this is "the marked lack

of professional strength on the part of the teachers."

The schools of St. Paul, Minneapolis, and Indianapoli-

s are much better. In St. Louis, he says,

"we have an example of how sad the lot of the child

may become when the superintendents not only do

practically nothing toward raising the standard of

the teachers, by instructing them in the science of education, but when they do much to depress them by examining their classes, and judging them by results alone." Of Baltimore he says: "Until a national change is effected, those attending the schools of that city will be doomed to a miserable childhood."

But it is not only the cities where many children are growing up without schooling. Says Professor Waetzoldt (see above):

"Consider the number of school days in a year in the United States. The annual average is only 134.3. I believe in Berlin we have no less than 240. Saturdays are holidays throughout America. The 134 school days are an average of terms varying greatly in different States. In the North Atlantic States, for instance Massachusetts and New York, there are 166 days in a school year; in the South Atlantic States, for instance Maryland and Virginia, 97; in the South Central States, for instance Tennessee and Kentucky, 88; and in the Western States, 135 days; New Jersey averages the greatest number of school days, 192; and North Carolina the least, 59; Illinois has 148.

"The obligatory course ostensibly requires an attendance of eight years, from the sixth to the fourteenth year. The course of the so-called primary school covers the first four years; the primary school prepares for the grammar school, the course of which likewise requires four years. In round numbers, 12,697,000 pupils out of the 62,500,000 inhabitants of the Union attended these elementary schools during 1890. Of these 12,697,000 only 8,144,000 children attended every day of the average 88 to 135 school days; that is to say, only 64 per cent. attended regularly. Every day of the average 135 days, 36 out of every 100 pupils, or one of every three, a very large proportion, missed school. The best attendance is found in Massachusetts. In that State it is 73.7; in South Carolina, 73.4; and in New Mexico, 80 per cent. But this happy State has only 63 days in a school year. To form a just estimate of the general statistics referring to attendance at school, proper allowances must be made for the greater or fewer number of school days in the year. . . .

"According to available statistics, the schools of Minnesota are the ones in which attendance is poorest, the number of school days during the year are 120, and only 45 pupils out of every 100 attend. This is probably 100 small an average, for Minnesota, I believe, possesses excellent schools. Even in a State as old as Maryland, in which Baltimore is situated, only 15 out of every 100 pupils attended school regularly. In the United States the average number of days with a full attendance were 86 out of the 134—namely, a proportion of 40 days non-attendance to every pupil. In North Carolina the number of days of full attendance averaged 37 out of 59; in Massachusetts, 135 out of 177; in the District of Columbia (the city of Washington with its suburbs), 135 out of 178; in New York, 115 out of 186, and in Illinois, 107 out of 148.

"The average attendance at school throughout the United States covers four of the eight years; in large cities five to six years; in the South sometimes only one year, occasionally a few months only. This circumstance easily explains the policy of many cities in omitting all studies not absolutely necessary, eventually limiting the course to the three R's—reading, 'riting, and 'rithmetic."

Another evil that Professor Waetzoldt points out is the low pay of teachers, and consequently the number of inferior teachers. He says (*idem*):

"The entire school expenditure of the city of Chicago, with a population in 1892 approximating 1,614,000, amounted to \$4,015,000, or 16,800,000 marks. Two and a half million dollars, considerably more than one half, was appropriated for salaries. Salaries of principals of grammar schools are divided into

groups proportionate to the number of classes and pupils in their schools and the amount of work to be done. The first group of principals of grammar schools receive \$1050 the first year, and the salary increases every year until it amounts to \$1200. The second group ranges from \$1200 to \$1400, the third group from \$1400 to \$1600, and the highest group from \$2300 to \$2500.

Principals of primary schools begin with \$1050, and never receive more than \$1600. In a city like Chicago,

Country Schools.

Politics.

where a working man receives on an average of \$2 a day, men and women teachers in primary schools begin with \$400, or 1620 marks, for the first year. The second year they receive \$475; the third, \$575; the fourth, \$650; the fifth, \$700; the sixth and the following years, \$775; *i. e.*, teachers can receive as high as 3250 marks—a proportionately small sum considering the necessity of the position, with no pension, no provision for widows, etc., attached. Teachers in grammar schools are somewhat better situated; they receive \$450 the first year, then \$525, increasing in eight years to \$800, or about 3350 marks. Substitutes receive \$1.50 a day, after they have been tried six months. The so-called school cadets—pupil teachers, in fact, whose employment was a necessity in years past in Prussia—also receive 75 cents a day for their work, which they perform under the supervision and guidance of a regular teacher. When we compare the purchasing power of a mark and a dollar, we understand that small salaries are the reason the teacher's profession receives so few accessions. . . . To merely touch the question of the normal training of teachers in a word, Americans themselves best know that on the average it is still inadequate. The minority of teachers are educated at normal schools. The ever-changing board, the superintendent, or occasionally a lower official, often influenced by politics, decides upon a teacher's capacity. A definite educational policy is not prescribed, and there is no uniform examination. . . .

"I very well know that America has excellent institutions and brilliant teachers, but we must not look only at the flower so willingly held out to us. We must not limit ourselves to cities renowned for their schools; we must ask how matters are in general. According to the judgment of a very competent American school-teacher, the work done in normal schools does not compare with that of a German seminary. Pedagogically and scientifically restricted, the teacher naturally becomes dependent. The principal and inspector instruct him weekly and even daily, prescribing the daily lessons in every detail. Thus the opinion gains credence that the achievements of a school are attributable to the board and inspectors, and not to the teachers. Teachers must first be prepared.

"There is no professional body of teachers with determinative power, no faculty meetings that have decisive disciplinary and other powers. In many cities the teacher is a poor day-laborer, who earns his bread in sorrow and fear of the Damocles sword of loss of position which hangs over his head. In the whole country there is no profession of teaching which rests on an average uniform education, the consciousness of professional work and its magnitude; the nation, as such, does not recognize it. Teachers have no representative corporation; what we hear of the national association of teachers and the great congresses are, with very few exceptions, all efforts emanating from secondary and higher schools, in which only principals, inspectors, etc., participate. This deficient professional preparative of the public-school teacher is, next to political influence, the most vulnerable point of the whole American school system. It is evident that the achievements of even a highly gifted people must fall below a high standard under such a régime."

Of politics in the public-school system Professor Waetzoldt says:

"In many cities the administration and superintendence of schools, the appointment of teachers, and promotions are purely political questions. Change of party rule often brings about a change of the whole personnel of schools, first of commissioners and superintendents down to the ranks of the teachers. This, together with other things, creates a want of stability in American schools; there are no traditions of pedagogic experiences, neither in a school nor in a city. How different in Germany! What an abundance of traditions and pedagogical experiences are collected in a normal school 100 years old! In America hasty experiments replace the slow growth in Germany. The new principal, the new member of the school board, and the new administration are too impatient to carry out their political and moral views and ideas during their term of service. No one has time to finish his work, for he does not know how long he may be engaged in it; but everybody experiments. On the other hand, this constant changing is an advantage to education; nowhere outside of America are new ideas more easily brought to light and put into practice."

But perhaps the deepest evil in our schools is

the lack of moral teaching. Until this century moral teaching has gone principally with religious teaching. The modern divorce of Church and State, the opposition of secularists to all religious teaching, **Immorality.** and, above all, the opposing views of Protestant, Roman Catholic, and other religious bodies, having led to the disuse of religious teaching in public schools, a lowering of the tone and the time given to moral teaching has almost inevitably the not necessarily followed. The coming of the children of ignorant emigrants into the public schools has increased the difficulty, while many of our native children have developed immorality equal to that of the foreign element. Many parents fear to send their children to public schools, and yet it is not proven that the moral tone of most private schools is better. "In the month of December, 1881, a California State Teachers' Institute was held in San Francisco. With scarcely a dissentient voice it was declared that the children of our public schools were addicted to lying and dishonesty. . . . A committee of Massachusetts ladies made a report declaring that the 'teachers almost universally complain of the prevalence of lying, stealing, profanity, and impurity among their scholars.' (*The School Question*, pp. 97, 115.) A writer in the *Atlantic* for May, 1894, argues that more attention is being given to the teaching of moral purity, but says that in a large class of young women graduates of public schools, in one of our older States, all but two confessed to hearing in their early life in the public schools what they could never forget, the no words could express the longing they felt to blot it from their memory.

This statement of the immorality of the public schools is not to be confused with the Roman Catholic assertion that they are "godless," the Roman Catholics and some others connect the two propositions. For a discussion of religion in the public schools see article under that heading. All believe, however, that in some better way than at present morals and ethics need to be taught in public and private educational institutions, and all agree that the lack of this is among the most serious evils of the present time.

In regard to universities, the main need is increased provision for research and ampler endowments, with a vastly increased system of scholarship for promising students. Mr. Charles F. Thwing (*Forum*, vol. xviii., p. 630) states **Universities.** that the average cost of a student per year at the better colleges is larger than the total income of the average American family. He says that every element in the cost of an education has increased in the last 60 years three or fourfold. To-day a higher education for most people is impossible. Says Kidd, in his *Social Evolution*: "Even from that large and growing class of positions for which high acquirement or superior education is the only qualification, and of which we consequently (with strange inaccuracy) speak as if they were open to all comers, it may be perceived that large proportions of the people are excluded—almost as rigorously and as abso-

lutely as in any past condition of society—the simple fact that the ability to acquire such education or qualification is at present the exclusive privilege of wealth.”

V. PROPOSED REFORMS.

The more radical proposals of the extreme individualists who would abolish all State schools, and of the socialists who would carry State compulsory education, we consider later. Special reforms as to the teaching of Temperance, and as to Industrial Education, Evening Schools, Normal Schools, University Extension, are considered under these special heads.

As to insufficient school accommodation, the only remedy is the granting of enough appropriation to provide adequate accommodations. Of New York City *The Outlook* of August 17, 1895, says :

“The city has already invested \$25,000,000 in school property, but it is not too much to say that during the next decade an equal sum will be needed to provide properly for its needs in both teachers and buildings. At present the latter are not large enough, are overcrowded, have too little ventilation, with insufficient air and light, and are often unhealthfully located and have few good playgrounds. The enormous population in the congested districts of the metropolis makes these deficiencies specially pitiable. Mr. Augustus Johnson makes a good suggestion in respect to these districts. He asks :

“Is it better to have five schools containing 1000 children each within gunshot of each other, surrounded by overtowering and contagion-breeding tenement-houses, saloons, and nuisances of every kind, or one large school-house for 5000 children, covering an entire central block, which shall not be suffocated by its surroundings and crowded by nuisances? Fronting on four streets, with an inner court for playgrounds, such a school building will be accessible to the children living on four or five blocks from each front, and, because covering so much ground, need not be so high as to endanger the health of children now obliged to climb many times daily to the fourth or fifth story. Such a school building might be made a model of school architecture for beauty and convenience, an object-lesson not for the East Side only, but for the continent and for the world. New York may well afford to offer prizes for the best architectural designs for such a building.”

As to taking the schools out of politics, some propose absolute State or national control, as in Germany. This is opposed by most. Mr. J. M. Rice (*Forum*, vol. xvi., p 500) favors a permanent State Board of Education composed of five or six educational experts, with an adequate number of superintendents. He favors also laws as to the appointment of teachers, so that their positions may not be used for purposes of patronage, laws limiting the amount of mere memorizing of text-books, laws compelling a certain amount of objective work, laws compelling the employment of phonics in teaching children to read. The three main laws for a good school system he believes to be (1) divorce from politics in every sense of the word, (2) thorough supervision, (3) development of professional and general intellectual strength in the teachers.

In regard to secondary schools, there has recently been concerted action.

“It has come to be distinctly recognized that any far-reaching educational reform in this country must begin with the secondary schools. The elementary school is helpless if the secondary school refuses to cooperate with it in raising the standard of scholarship and improving the methods of instruction.

“Except in those Western States where a State University stands at the head of the State school system—as in Michigan, Minnesota, and Nebraska—there is great uncertainty and diversity in the relations of the secondary schools to the colleges, and in the work of the secondary schools themselves. To remedy this condition of things there was begun by a few members of the National Educational Association, in the summer of 1892, a movement which culminated in the appointment by the Association of a committee of 10, of which President Eliot of Harvard was chairman. The report of the committee was printed by the Bureau of Education as a public document.

Secondary Schools.

“The investigation brought to light the fact that more than 40 separate subjects of instruction were to be found on the programs of prominent secondary schools. On all points, except the time allotment, the committee was unanimous in recommending what progressive teachers agree in considering wisest and best.

“The committee provides in tabular form the material of which a thousand programs may be made, and then gives four sample programs of their own. The four are called, respectively, the classical, the Latin-scientific, the modern language, and the English. The first makes provision for three foreign languages, one of which is modern. The second finds room for Latin and one modern language. The third embraces both French and German, but no ancient language; while the fourth provides for one foreign language, which may be either Latin, French, or German. No one of the programs excludes the study of the natural sciences, history, or geography. The time-allotment among the several subjects affords opportunity to get from each the kind of mental training it is specially fitted to supply. The different principal subjects are put on an approximately equal footing. All short information courses are omitted, and the instruction in each of the main lines—*viz.*, language, science, history, and mathematics—is substantially continuous.

“The committee are of the opinion that, under existing conditions in the United States as to the training of teachers and the provision of necessary means of instruction, the classical and Latin-scientific programs must in practice be distinctly superior to the other two. In other words, we have not yet reduced the teaching of natural science and the modern languages to the same precision that is found in the case of the classics and mathematics.”

Coming now to more radical views, we have two opposing extremes: the socialist view that would carry compulsory State education to the farthest degree, and the extreme individualist view that would do away with all State schools. Socialists of all types favor the fullest development of State education. Says Mr. Graham Wallas, in the *Fabian Essays* :

Socialist View.

“If this generation were wise it would spend on education not only more than any other generation has ever spent before, but more than any generation would ever need to spend again. It would fill the school buildings with the means not only of comfort, but even of the higher luxury; it would serve the associated meals on tables spread with flowers, in halls surrounded with beautiful pictures, or even, as John Milton proposed, filled with the sound of music; it would seriously propose to itself the ideal of Ibsen, that every child should be brought up as a nobleman.”

Says Sidney Olivier (*idem*) :

“The ideal of the school implies, in the first place, leisure to learn; that is to say, the release of children from all non-educational labor until mind and physique have had a fair start and training, and the abolition of compulsion on the adult to work any more than the socially necessary stint. The actual expenditure on public education must also be considerably increased, at any rate, until parents are more generally in a position to instruct their own children. But as soon as the mind has been trained to appreciate the inexhaustible interest and beauty of the world, and to distinguish good literature from bad, the remainder of education, granted leisure, is a comparatively inexpen-

sive matter. Literature is become dirt-cheap; and all the other educational arts can be communally enjoyed. The schools of the adult are the journal and the library, social intercourse, fresh air, clean and beautiful cities, the joy of the fields, the museum, the art gallery, the lecture hall, the drama, and the opera; and only when these schools are free and accessible to all will the reproach of proletarian coarseness be done away."

Mr. Sidney Webb, in giving in the Fabian Essays a statement of the current socialist demands for further legislation, gives under the head of educational reform the following statement:

"*Object.*—To enable all, even the poorest, children to obtain not merely some, but the best education they are capable of.

"*Means.*—1. The immediate abolition of all fees in public elementary schools, Board or voluntary, with a corresponding increase in the Government grant. 2. Creation of a minister for education, with control over the whole educational system, from the elementary school to the university, and over all educational endowments. 3. Provision of public technical and secondary schools wherever needed, and creation of abundant public secondary scholarships. 4. Continuation, in all cases, of elementary education at evening schools. 5. Registration and inspection of all private educational establishments."

In America, the Socialist Labor party includes among its social demands "the school education of all children under 14 years of age to be compulsory, gratuitous, and accessible to all by public assistance in meals, clothing, books, etc., where necessary."

Mr. Lawrence Gronlund, in his *Cooperative Commonwealth*, advocates compulsory education, with support of the children and youth up to the twenty-first year, and this is the ideal of most socialists in Germany and elsewhere.

Opposed to the socialist program is the extreme individualist proposition to do away with all public schools. Even Mr. Spencer talks of the "tyranny" of compulsory education, and "the cases in which men let themselves be coerced into sending their children to receive lessons in grammar and gossip about kings, often at the cost of underfeeding and weak bodies." (*Justice*, p. 178, American edition.) He says:

"On the day when £30,000 a year in aid of education was voted as an experiment, the name of an idiot would have been given to an opponent who prophesied that

in 50 years the sum spent through imperial taxes and local rates would amount to £10,000,000, or who said that the aid to education would be followed by aids to feeding and clothing, or who said that parents and children alike, deprived of all opinion, would, even if starving, be compelled by fine or imprisonment to conform and receive that which, with papal assumption, the State calls education. No one, I say, would have dreamt that out of so innocent-looking a germ would have so quickly evolved a tyrannical system tamely submitted to by people who fancy themselves free" (*A Plea for Liberty*, p. 16). He considers that it leads to pauperization, and says:

"Legislators who in 1833 voted £20,000 a year to aid in building school-houses never supposed that the step they then took would lead to forced contributions, local and general, now amounting to £6,000,000; they did not intend to establish the principle that A should be made responsible for educating B's offspring; they did not dream of a compulsion which would deprive poor widows of the help of their elder children; and still less did they dream that their successors, by requiring impoverished parents to apply to Boards of Guardians to pay the fees which school boards would not remit, would initiate a habit of applying to Boards of Guardians, and so cause pauperization" (*The Coming Slavery in Man vs. The State*).

Mr. Mackay, in *A Plea for Liberty*, summing up the individualist argument, says:

"If men will grant for a moment, and for the sake of argument, that, as some insist, our compulsory, rate-supported system of education is wrong; that it is injurious to the life of the poor; that it reduces the teacher to the position of an automaton; that it provides a quality of teaching utterly unsuited to the wants of a laboring population, which certainly requires some form of technical training; that here it is brought face to face with its own incompetence, for some of the highest practical authorities declare that the technical education given in the schools is a farce; that therefore it bars the way to all free arrangements between parents and employees, and to the only system of technical education which deserves the name; if this or even a part of it is true, if at best our educational system is a makeshift, not altogether intolerable, how terrible are the difficulties to be overcome before we can retrace our steps and foster into vigorous life a new system!"

These individualists, doing away with all compulsory or State education, would have only voluntary schools for those who can pay for them, believing that men will get better education if they pay for it, and that those who can pay but little would value that little, and get what they did more suited to their needs, if it cost them effort. They believe that here, as everywhere, a free competition or education means the development of the best schools and the best school system.

EIGHT-HOUR MOVEMENT AND PHILOSOPHY. See SHORT-HOUR MOVEMENT.

ELBERFELD SYSTEM.—Attention has been widely attracted to the methods of poor relief adopted in Elberfeld, and copied in many German cities. In 1823 the Prussian Government authorized each commune in the Dißeldorf circle to take charge of its own poor relief, but until 1850 the old system, founded upon that of the French empire, remained in vogue. A system in the charge of wealthy individuals, especially Lutherans, was then tried. The cost of the relief in 1852 was £8932, while in the Lutheran community it was 30 per cent. higher than in the rest of the city. At the instigation of Daniel von der Heydt, a banker of Elberfeld, the existing scheme was authorized.

Here is the system in brief: Elberfeld is one of the largest manufacturing towns of the empire, and contains many poor. For poor-law purposes it is divided into 364 sections, each section therefore consisting of about 300 people more or less. Every 14 sections constitute a district. Over each section of 300 inhabitants is placed an almoner; and over each district, which has 14 almoners, is appointed an overseer. All these officers are under the control of a central committee of nine, of which the mayor is *ex-officio* president, four members are town council-

ors, and the other four are ordinary citizens. The 364 almoners and 26 overseers are unpaid, but all is under city control.

The duties of the almoners are extensive and precise. Every person needing relief makes application to the almoner of his own district. It is then the duty of the almoner to institute full and particular inquiries into all the circumstances of the case. He is also required to keep himself constantly informed so long as the applicant may continue to need relief. Every fortnight the 14 almoners of each district meet under the presidency of the district overseer; the reports of each are then considered, and the minute book prepared for the Central Committee. That committee also meets fortnightly on the day following the meetings of the almoners and overseers. The small size of the sections enables each almoner, without difficulty, to make himself thoroughly familiar with all the distress of his district, and with every exaggerating or favorably modifying circumstance connected with it. Being a citizen and not a paid official, he has no interest but to state the facts as plainly as may be, and to secure that the relief shall be such as is best suited to the necessities of each case. Relief is granted according to a fixed and uniform scale, which is so framed as to secure that only the minimum necessary for bare subsistence is supplied to the applicant and his family. Any small sums he may earn are considered and deducted so as to bring his rate of relief to the standard minimum. In addition to money help, tools may be lent—such as sewing-machines; and furniture also may be provided. One of the instructions of the almoner is that he is bound to use every possible effort to secure employment for those who may be in receipt of relief.

The result of this system has been that while from 1852-60 population increased from 50,000 to 71,000, the number of paupers declined from 8 to 1.5 per cent., or from 4000 to 1062, and the expenditures from £8932 to £3860. Yet the poor have been better provided for than formerly under individual management. (See CHARITY ORGANIZATION.)

ELECTION LAWS. See CORRUPTION IN POLITICS.

ELECTIONS.—We briefly consider in this article the working of elections in the United States, Great Britain, and France.

THE UNITED STATES.

Qualifications for voting in the United States vary somewhat with the States, but are largely the same. Except in four Western States, only males can vote on general elections, and in most States on school elections. (See WOMAN'S SUFFRAGE.) In all States voters must be citizens, except that in many States declared intention to become a citizen qualifies for voting under certain restrictions of time and place. A residence in the State is required in all States, varying from three months in Maine to two years in Missouri—one year being the rule, tho it is six months in many States. Residence usually of from one month to two months is required in county, town, and precinct. Connecticut, Massachusetts, and Mississippi require that the voter can read or understand the Constitution. Arkansas, Delaware, Georgia, Mississippi, and Pennsylvania require the payment of a tax. In all the States, with slight variations as to details, convicts, idiots, and the insane are not qualified for voting. In several States, paupers, United States soldiers, and marines are disqualified. In most Western States the Chinese are disqualified.

Elections in the United States are numerous and frequent, and here is one of the main sources of their evil. Federal elections come every four years; State elections come usually every year; municipal elections come also yearly. **Frequency.** sometimes on the same day and sometimes on different days from the other elections. In the case of each election (federal, State, and municipal), the voter has numerous candidates to vote for. In federal elections he votes for electors for President and Vice-President; in State elections he votes for governor, lieutenant-governor, congressmen, representatives to the State legislatures, secretary of State, attorney-general, sometimes judges, and several other officers. In city elections he usually votes for mayor, aldermen, common councilors, school board, commissioners of various departments. Besides this he is usually called upon to vote yea or nay on various questions of granting license or no. For each office three or four parties each nominate different candidates. The result is that frequently the voter has to have before him several hundred names. The ballot upon which the average city voter has to record his choice is often a blanket sheet covered with confusing names. Under the present system, then, the first characteristic of American elections is that even the voter who desires to be honest cannot go by his own personal knowledge of the candidates. It is impossible for him to know personally and to judge between the claims of the different men. He therefore is compelled to be guided in his choice by his party, by hearsay, or by the press. Here comes in the opportunity of the professional politician.

If a man will give all his time to the pulling of small political ropes, he has his busy neighbors at enormous advantage. He can go around and drum up votes for a particular candidate; he can work through the press; if he can run the party machine, he has the ward vote in his grasp, and the average busy citizen is helpless. He can do this even without recourse to corruption. But he has to live while he is doing this work. Hence the temptation to get his living by politics. They give abundant opportunity. To most political positions a salary is attached. If a man can get elected, it will pay him to give a portion **Professional Politicians.** candidates can afford to give sometimes large sums to professional politicians who can secure their election. Again, and perhaps quite as frequently, the professional politician is appointed himself to a small office by the party or clique he has helped to elect, and thus maintained to do the same work in another election. Often the duties of the office are small and the holder can give almost all his time "to running ward politics." Sometimes offices are created with only nominal duties, simply to create a living for these professional politicians. Sometimes they are appointed to large offices and depute their duties to some one else, while they attend to "politics." Against such professional politicians the ordinary citizen is well-nigh helpless. The ward politician knows every voter in his precinct. He checks all who

are sure Republicans and all who are sure Democrats. Then he studies the doubtful or independent whose vote will really decide the election. Some of these can be directly bought, some influenced, some fooled, some frightened. He treats each one in his own way. He promises some men appointments as policemen or as street cleaners, etc.; he induces some to vote for his party, because if they do they will enable some cousin to become a policeman and receive a sorely needed income. The ramifications of interested votes go very far, and the professional politician knows all the twists. He stands in with the saloon-keeper, and sometimes with the dive-keeper, and thus swings the liquor vote and the dive vote. He knows and flatters the leading Italian and Polish politicians of the ward, and so swings the large foreign vote. Against such machinations the non-professional voter can do little.

But thus far we have considered the professional politician alone, and with his power simply based upon the frequency and complexity of elections and the impossibility that the citizen who does not give all his time to politics can defeat such machinations.

When, however, the professional politicians band together, they become inconceivably more irresistible. And the system almost compels such banding. In the complexity of elections, each party has to appoint various committees to run the campaign. There are, first of all, the national committee, then State committees, city committees, county committees, ward committees, district committees. Some of these remain always active; others are appointed for campaigns. The committees that are best banded together and give

The Machine.

most time and thought and money to politics usually win. Thus, a machine is almost inevitably developed. Under the present system of election by State electoral votes, certain States become "pivotal." The vote of these States often turns upon the vote of great cities. A party that can carry New York City and Chicago and Philadelphia, and other large cities, has an enormous advantage. Hence city machines are developed, organized through professional politicians in all the wards. When a national election comes they can deliver the city vote, and to a less extent similar committees deliver the county vote.

It is not, however, in national politics so much as in municipal politics that the machines find their main power. City offices are often more lucrative than national offices. Hence holders of city offices can afford to pay more to the machine that elects them. Again, city offices often have far more appointing power. The machine that captures the city government can appoint to hundreds of petty clerkships and positions, as policemen, street-cleaners, etc. Hence the machine often prefers to rule the city than the State. Once more and mainly the members of the city government continually have enormously valuable franchises and jobs to bestow or to control. A change in the mere wording of a bill will make a difference often of hundreds of thousands of dollars. It is obvious that here corrupt legislators can gain large sums from in-

terested parties. To control such legislation is a prize, often in value beyond all others to the city machine. Hence the ring (*q. v.*), a large share of the city corruption, and the motives for dishonest elections.

Nor are these conditions which we have described the only elements in the situation. There is the great fact that a large proportion of the city vote comes from people in part ignorant and in part with little permanent interest in the community. In the city, too, few know more than a few of their neighbors. In this ignorance is the wire-puller's opportunity. Another element is in the rush of American life that makes it still more impossible for all except the professionals to follow the details and the dry work of political machinery. In the United States, there are as yet but few who, living on income, give their time unpaid to the public weal. Such a class is developing, but we shall see in a moment why they are particularly unfitted to cope with the situation.

Meanwhile we pass to notice the methods by which the machine controls elections. Its stronghold is in the primary. The primary is determined by its roll of ward voters entitled to vote in it. This roll is prepared by the ward committee. **Primaries.** It knows its own men. Others are admitted to the primaries on the votes of those already admitted. To gain admission, one often has to give a pledge to support the committee. Independent men are gotten rid of or refused admission. Subservient primaries are thus easily gotten. Honest men object to such measures, and either stay away or give up in disgust after fruitless efforts to capture the primary.

"At the last Republican primaries in New York City only 8 per cent. of the Republican electors took part. In only 8 out of 24 districts did the percentage exceed 10, in some it was as low as 2 per cent. In the Twenty-first Assembly District Tammany Primary, 116 delegates, to choose an Assembly candidate, were elected by less than 50 voters. In the Sixth Assembly District County Democracy Primary, less than 7 per cent. of the Democratic voters took part, and of those who did, 69 in number, nearly one fourth were election officers. The primary was held in a careless way in a saloon while card-playing was going on" (A. C. Bernheim in *Political Science Quarterly* for March, 1888).

Bogus lists of voters are often made. Men are brought in from other districts to vote for the machine.

When the primary meets a "slate" is brought in, and usually the names on it receive the nomination from the subservient primary. If a few opponents are present, they are usually allowed to make opposing but fruitless nominations, the committee being sure of the result. The chairman appointed by the meeting is almost always the tool of the committee. If there should be a split or division, sometimes a disturbance is purposely created, and in the confusion the chairman can declare the nominations carried. Often shouters and roughs are brought in to shout down all opposition. Usually when there is a division, it is merely a fight within the party, between two ward or city cliques, for offices,

both of which are subservient to the machine. Honest battles in the primaries are almost unknown, and "reformers" have almost given up in despair attempting to capture the primaries of the old parties under the present system. Their only hope seems to be to make independent nominations of their own. They sometimes win, in cases of the uprisings of indignant citizens, but the indignation does not last, and pretty soon the regular work of the old party machine wins again. Nor is there usually much hope in playing corrupt Republican primary against corrupt Democratic primary, especially in city politics, because the machine which once gets hold of a city usually gets such complete hold of it that in that city there is little rivalry between the two parties. With the rarest of exceptions, New York City is always Democratic and Philadelphia always Republican. So even with many smaller cities. Even where the cities are uncertain, certain wards in each city can always be counted on for a certain party. Sometimes, too, the same municipal ring controls the primaries of both parties. Such are some of the difficulties of reaching the primaries.

Above the primary is the convention. The convention is usually safe for the machine, because the machine has already captured the primaries that send the delegates. The machine nominates a temporary chairman, and he is elected usually by subservient delegates; if not, roughs and shouters are brought in. He names the committee on contested seats, which committee, passing on the titles of delegates, can admit the friends and refuse admission to the opponents of the machine. In all doubtful cases the machine favors itself. It then gets the chairman of the convention, and has practically all power in its hands. Such are some of the methods of American electioneering.

When it comes to the voting, the ward and county committees are instructed to see that the full party vote is polled and that all the doubtful are canvassed. Money is sent to the different committees to buy

Campaigns, those who can be bought. Men are hired to go among the trade-unions and secure the labor vote. Papers are bought up or filled with paid editorials and paid "news." The papers of the foreign populations are subsidized. Campaign circulars are prepared suited for special classes and addressed to clergymen, to merchants, to "the American working men." "Orators" are put upon the stump and sent to every district. National orators are carried in special trains from city to city. Carefully prepared reports of extempore speeches by the rival candidates are put in the daily press. Mud, if necessary, is slyly thrown. Sometimes lies are circulated at the last minute when it is too late for the opposing party to refute them. "Claims" are made showing that all the country is going one way. Processions and monster parades are formed. Those away from home get their railway fare paid if they will go home and vote for a certain party. The railroads grant free passage to those who will vote in their interest. Taxes are paid for votes. Minor forms of corruption are resorted to. Such are some of the elements of American elections.

The Australian ballot system has in the main done away with direct intimidation at the polls, but indirect influences still remain. In the election of 1896 many manufacturers are reported to have said to their employees (and perhaps in perfect honesty), "This is a free country; you can vote exactly as you please. If so and so is elected we will raise your wages; if so and so is elected we will shut down the shop. This is a free country; you can vote exactly as you please."

The reforms proposed for election evils in the United States are very various. Many of these we discuss in particular articles. They vary with the various conceptions of the cause of the evil. Professor Commons finds a main cause of the evil in the fact that American representatives must be elected almost universally from the district in which they live. This limits the possible candidates and gives the machine the chance to pull its local wires and appeal exclusively to local interests. He would, therefore, in part reform elections by doing away with this proviso. In company with many others, he would also introduce proportional representation, for a discussion of which see that article. To others the Referendum and the Initiative are the one way of escape. (See REFERENDUM.) Under the present system, independence seems a sham.

Professor Giddings (*Political Science Quarterly*, vol. vii., p. 124) asserts that "the total possible gain or loss to a political party through strictly independent voting does not exceed, under the most favorable circumstances, 5 per cent. of the maximum total vote of a presidential year." This statement is sustained by even the unprecedented "landslides" of the past six years.

It is in the exaggerated weight of small factions holding the balance of power between the two parties that is to be found the secret of the corrupt influences already described. The great majority of the voters are conservative, and do not readily change their party. Especially in close districts, therefore, interested elements can dictate terms to both parties. This, too, gives the bribable vote an influence far in excess of its proportions.

Mr. Albert Stickney, in his *A True Republic*, finds the cause of the dominance of party in the term system. He says:

"When we said (as we did in effect in our constitution) all public servants shall depend for keeping their offices, not on whether they do their work well or ill, but on carrying the next election, then, instead of giving them each a separate interest to do his own work well, we gave them all one common interest to carry the next election. We made it certain that they would combine and form parties for the purpose of carrying elections.

"But there is another point. The knowledge which all men had that at the end of a fixed time there would be a large number of vacancies, made it certain that other men who were not in office would combine for the purpose of getting out the men who were in office, and getting in themselves. The term system was certain then to create two great parties for the purpose of carrying elections. The men who were in formed a party to keep office. The men who were out formed a party to get office."

Term System.

For other conceptions of the cause of the evil

other cures are proposed. It is proposed that elections be made more rare and men be elected for longer terms. It is advocated that fewer offices should be made elective, and that more should be by appointment, and, above all, by civil service (*q.v.*). It is proposed by not a few to limit the suffrage under one form or another. It is said that national and municipal elections should be put on different days. It is increasingly felt that the methods of controlling the primaries should be changed by law. Many ways of attempting to control primaries have been proposed. Most of the States have laws on the subject, but none are effective. The best are those of Kentucky and Missouri. In 1879-80 Kentucky passed a law calling for direct nominations at the primaries without a delegate convention. This simplifies machinery, but has not reformed it.

The Missouri law—applicable to St. Louis—provides for holding primaries under the supervision of the regular election machinery, with regular judges and clerks under the law of the State. But the law is not mandatory, and as the expenses are to be met by the parties holding the caucus, parties are not anxious to be at an expense to secure their own reform. A bill has been proposed in Illinois compelling caucuses to be held under State control. For a review of these and other proposals, see an article by Edward Insley in the *Arena* for June, 1897. Others believe that the primaries can only be reformed by requiring the use in them of the secret ballot.

Radicals, however, usually argue that none of these proposals really go to the bottom of the question. If elections were less frequent and terms of office longer, the machine would still rule, and having got its men into office, could better entrench themselves in their long stay. Making offices, too, subject to appointment instead of election can do little good if those who make the appointments can be dishonestly elected. Limiting the suffrage will do little good. It is the rich and educated who buy votes who are at least as dangerous as the poor who sell their votes. (See PLUTOCRACY; DEMOCRACY.) The separation of national and municipal politics can avail nothing if a machine rules both. The primaries undoubtedly should be controlled, but even were nominations as well as elections by secret ballot, interested professional politicians could always defeat uninterested desultory secret voting. The one way to secure electoral reform, says the radical, is to interest the average voter, and the one way to interest the voter is to give him a program that appeals at once to his loyalty and his interests.

The respectable and wealthy "reformers" who are trying to reform American politics do not succeed because they are investors themselves in the various gas companies, car companies, etc., that rule our cities and debauch our politics. Expand the function of the city, raise its ideal, and it shall lead to purer politics. Such is the radical view. (See CITY; CORRUPTION.)

GREAT BRITAIN.

The conduct and conditions of elections in Great Britain are quite different from those in

the United States. The qualifications for the franchise are more complicated in Great Britain, but the elections are less frequent and for a smaller number of offices, so that they do not give the same opportunity to professional politicians, while the very strict *Corrupt Practices Act (q.v.)* makes illegitimate campaigns too dangerous to be profitable. Again, the fact that parliamentary elections do not come at stated times, and that the methods of nominating candidates are very simple, give comparatively little opportunity for the development of a machine, tho there are some indications that the multiplying of officers to be elected is developing more of a machine.

Qualifications for the suffrage differ in England and Scotland, etc., and differ for parliamentary, municipal, and school board elections. In Scotland rates are levied on all householders, and for the parliamentary elections all men who have paid their rates or lodgers who occupy quarters worth £10 a year, or all occupiers of non-residence property worth £10 a year, or owners of town property worth £10 a year, provided the men live within seven miles of the town, can vote. This allows some to have more than one vote and disenfranchises very many of the poorer householders, who dodge their rate and lose their vote. It is really a rate-payer's enfranchisement. Says Albert Shaw (*Municipal Government in Great Britain*, p. 42): "The whole body of men, who are ignorant, vicious, and irresponsible, is practically outside the pale of politics in Glasgow and Edinburgh, Dundee and Aberdeen." The municipal franchise is the same, except that women who are occupiers or rate-payers may vote, and that no man may vote in more than one ward. The school board franchise is practically the broadest of all, because it is not dependent on the payment of rates, and because the ownership or occupancy of property worth £4 a year is the limit, and not £10, as above. In 1891 the Glasgow parliamentary voting list numbered 78,738 names; the municipal list added the names of 15,448 women; the school board list numbered 141,152.

In England, the legal qualifications are practically the same, but they work differently, because while in Scotland the rates are collected directly and separately from owners and occupiers, in England the rates for the tenements of less value are collected from the landlords at a 30 per cent. discount, the landlord charging it to his tenant. There is, therefore, for the poorer tenants less chance of dodging the rates, and so they more frequently vote. In Birmingham, for 95,500 inhabited houses, Mr. Shaw finds 81,100 parliamentary voters. This system of rate-paying largely disenfranchises the unmarried men. In the parliamentary borough of Birmingham, out of a registration of 72,000, there were only 400 lodgers on the list. The list of voters being drawn from the rate-payers' list, very many lose their franchise because they have moved since the list was made, especially when the election comes late in the year. A late election is said to favor the Conservative Party.

Such limitations on the franchise as this make

The Suffrage.

elections in Great Britain very different from those in America. The fact, too, that elections do not all come at the same time attracts general attention to each separate election, and makes dishonesty more difficult, while extending the interest of all classes. The English system of "heckling," or of having the candidate appear before his constituents with any one free to question him, is often only a farce, but some consider that it interests and educates the separate voters. The main reason, however, for purer elections is the important Corrupt Practices Act (*q. v.*), which limits the amount of campaign expenses that may be incurred, and compels the candidate to have his expenditures all go through the hands of one man, who must make a rigid report, to be scrutinized by members of the other party. This and the ease of nominations, with the irregularity and comparative infrequency of elections, presents the development of the party machine system.

Mr. Albert Shaw (*idem*, p. 47) thus describes the nominating and polling machinery after the election writs have been made out :

"The names of candidates must be left at the clerk's office, inscribed upon official blanks, a week before the election. Accompanying each

name must be the signature of a 'proposer,' a 'seconder,' and eight

Nominations. other citizens. Only such persons as have been nominated in this way may be voted for. Nominations

being all in, the list is at once printed and conspicuously bulletined. The announcement contains the full names, residences (street and number), and occupations of the nominees, and the names of the proposer and seconder in each case. If only one nomination has been made in any ward, the nomination is itself the election, and the polls will not be opened in that ward.

This is a good and sensible system upon its face ; but experience alone can tell us how any piece of political machinery will actually work. Ought this system to be productive of many nominations, or of few? The most natural inference would seem to be that its adoption would increase the number of candidates, since any ten men may secure for an eleventh man, without expense, the official announcement of candidacy, and the placing of the candidate's name upon the ballot papers.

"But this inference is not justified by the facts. In recent municipal elections, altho party issues have been introduced to a quite unprecedented extent and the number of ward contests has been materially increased by the unwonted employment of the occasion for a testing of strength on the Home Rule question, it is nevertheless true that contests have been confined to a minority of the wards, taking all the towns together. This must seem to the American observer a remarkable state of things. It means that, in a majority of the wards, public opinion had in advance agreed so decisively upon a particular man that nobody was nominated against him, and the entire expense and distraction of a contest at the polls was thus obviated. Closer inquiry will reveal the fact that by far the greater number of these cases have to do with the reelection of men already in the council.

There is every year a considerable list of towns which, in spite of the exceptionally acute condition of party feeling throughout the country, renew one third of their councilors without a single ward contest, all the new members obtaining their seats by virtue of unopposed nominations. There were not less than 50 such fortunate towns in November, 1893. These are not often the large towns. . . .

"The preliminary selection of party candidates usually rests with ward committees, candidature being accepted and ratified by the voters in open ward meetings, where municipal questions are discussed. The American primary election or party caucus system is quite unknown, and in ordinary cases the distinctions of party are not strenuously emphasized. The councilor from a decidedly Liberal ward is likely to be a Liberal ; but he is in most cases as entirely acceptable, so far as municipal matters are concerned, to the Conservatives as to the Liberals, and he will never in any case be opposed by a nominee of the other party who is brought forward for the sole purpose of maintaining party organization in the ward. An Englishman is not often willing to be put up for a place merely to be sacrificed. The extension of the franchise is resulting in more elaborate and more democratic forms of party organization in England ; and it is not unlikely that the future may see party lines more closely drawn in municipal elections than they have been up to the present time—a prospect not by any means welcome.

"Meanwhile, however, the freedom of nomination is a great safeguard. So long as ten citizens of a ward can place a candidate on the official voting paper, there is no great danger from party machinery."

The method of balloting need not be described here. It is secret balloting. (See AUSTRALIAN BALLOT SYSTEM.)

FRANCE.

The French electoral system is quite different from either that of the United States or Great Britain. Here, again, we do not have the appearance of the party machine, as in the United States, tho the Government often plays an unfortunate part through its use of *secret service* money in aiding candidates favorable to the administration. There is not much direct bribery, on account of the strictness of the law ; but the candidate who can spend for campaign posters, meetings, or sometimes for bodies of supporters, who will keep his meetings in order and disturb or break up the meetings of his rival, has an undue advantage. One reason, perhaps, that the party machine has not developed is that the French governments have been so unstable and parties broken into so many groups that there has been small chance for strong parties to develop. A more effectual reason, however, is the use of the *second ballot*. According to the law, there is no election unless some candidate has secured at least one quarter of the registered voters, or at least a half plus one of the votes cast. If no candidate has received this another polling must be held

**Second
Ballot.**

a fortnight later, when a simple majority of the ballots cast suffice for a choice. The result of this is that on the first election day votes may be scattered among different candidates without risk, for they all tell against the common enemy, and on the second election they can all be rallied for that candidate of a party who has received the highest vote. The first ballot thus serves as a democratic way of nominating candidates, with little need of conventions, campaign committees, etc. Elections were formerly by the *scrutin de liste*, or the voting for all the deputies allotted to a department by all in the department. Now, however, some elections are universal, or the election of one candidate by each district.

References: See the books quoted in this article.

ELECTORAL COLLEGE, THE.—The Constitution of the United States (see PRESIDENT) calls for the election of the President by electors chosen by the people of each State. This body of electors is called the Electoral College. Each State chooses a number of Presidential electors equal to the number of its representatives in both Houses of Congress. These electors meet in each State on a day fixed by law and give their votes in writing for President and Vice-President. The votes are transmitted, sealed, to the Capitol, and there opened by the President of the Senate in the presence of both Houses and counted. The electors cannot be members of Congress nor holders of any federal office.

The aim of this law was to secure the election of the President in a quiet, deliberate way by trusted representatives of the people. It was feared that the masses might not elect the best

men if left wholly to themselves, and that popular direct elections might lead to disturbances. It was thought, too, that as the electors' votes are counted promiscuously, and not by States, each elector's voice would have its weight. He might be in a minority in his own State, but his vote would, nevertheless, tell, because it would be added to those given by electors in other States for the same candidate.

No part of their scheme seems to have been regarded by the constitution-makers of 1787 with more complacency than this, altho no part had caused them so much perplexity. No part has so utterly belied their expectations. The Presidential electors have become a mere cog-wheel in the machine. They have no discretion, but are chosen under a pledge to vote for certain men—a pledge of honor merely, but a pledge which has never (since 1796) been violated. The plan, too, has done positive harm. It has made the election virtually an election by States, for the present system of choosing electors by "general ticket" over the whole State causes the whole weight of a State to be thrown into the scale of one candidate and party. Hence in a Presidential election the struggle concentrates itself in the doubtful States, where the parties are nearly equally divided, and is languid in States where a distinct majority either way may be anticipated, because, since it makes no difference whether a minority be large or small, it is not worth while to struggle hard to increase a minority which cannot be turned into a majority. Hence also a man may be, and has been, elected President by a minority of popular votes. (See PRESIDENT.)

The following is the electoral vote of the States as based upon the Apportionment Act of February 7, 1891:

ELECTRICITY.—It is a common thought that we are passing out of the age of steam into the age of electricity. Not a few believe that this will change the whole industrial situation. Some believe that it will make unnecessary the great factory with its attendant evils, etc. Says David A. Wells (*Recent Economic Changes*, p. 400):

"Dr. Werner Siemens, the celebrated German scientist and inventor, in a recent address at Berlin on

Science and the Labor Question, claimed that the necessity for extensive factories and workshops—involving large capital and an almost 'slavish' discipline for labor—to secure the maximum cheapness in production, 'was due, to a great extent, to the yet imperfect development of the art of practical mechanics,' and that mechanical skill will ultimately effect 'a return to the system (now almost extinct) of independent, self-sustaining domiciliary labor' by the introduction of cheap, compact, easily set up and operated labor-saving machinery into the smaller workshops and the homes of the working men. Should the difficulties now attendant upon the transmission of electricity from

points where it can be cheaply generated, and its safe and effective subdivision and distribution as a motive force, be overcome (as it not improbable they ultimately will be), thus doing away with the necessity of multiplying expensive and cumbersome machinery—steam-engines, boilers, dams, reservoirs, and water-wheels—for the local generation and application of mechanical power, there can be no doubt that most radical changes in the use of power for manufacturing purposes will speedily follow, and that the anticipations of Dr. Siemens, as to the change in the relations of machinery to its operatives, may at no distant day be realized."

This is not, however, so sure. It is more than the use of steam or water power that produces the large factory. (See DIVISION OF LABOR.) When one realizes the large plants that electricity has already of itself necessitated, and the reappearance in electric works of most of the old industrial problems, one cannot be so sanguine of electricity's solving the factory question. Electricity, however, may lead to healthier and more roomy factories, with its easily transmitted power.

Another way in which electricity may affect society is by rendering possible cooperative housekeeping. When the telephone can enter every home and electric motors can be in every house, many domestic operations, like sewing, etc., can be managed by electricity, and meals can be ordered at cooperative ovens by telephonic order. It is in such ways that many believe that our "domestic problem" is to be largely worked out. In any case, it cannot be doubted that electricity will immensely affect, as it has already very far affected, the social problem. When one realizes how far the weather signal service has affected and may affect agriculture and navigation, how commerce to-day is dependent upon the telegraph, one can see how wide already are its results. It has well-nigh displaced the horse-car. In lighting it is still more operative, rendering possible many industrial operations otherwise impossible. Yet the applications of electricity are still in their infancy. Says Charles D. Lanier in the *Review of Reviews* (July, 1893), in an article on Edison (p. 50):

"Those who are greatest in the march of mechanical progress confidently predict that future discoveries will be as incredible to us as the present science would be to our forbears of two centuries back. One single further secret won from nature will open a practically limitless field for electrical introduction, and will probably be more decided in its quantitative results, as the technicians say, than any invention the world has seen. It is the direct production of electricity from oxygen and coal (carbon). At present we burn coal to obtain steam, which is transmuted into mechanical energy and thence into electricity. Before the energy of the coal reaches the dynamo, six sevenths of its power are lost, even under the very best conditions, and afterward one tenth of the remainder. Find a way to dispense with the steam engine in this making of electricity, and we have multiplied several times the available mechanical energy of the world. Thousands of the brightest and most earnest engineers and chemists are now striving, generally in secret, to obtain this gigantic result—beside which the philosopher's stone was but a bauble. Edison has worked on it, and confidently predicts that the discovery will come.

"When we shall have made this eternal saving in our fuel supply, the Atlantic steamships will need only a snug little coal bin for 250 tons of coal instead of one for 2500 tons. There will be no more forced draughts, and grimy, consumptive stokers, and the five-day record will be an uninteresting reminiscence. The great English shipbuilders can already construct a

vessel to go 40 knots an hour, if only she could burn 2000 tons of coal a day; then she will only have to burn 200. Then it will take only one twentieth of an ounce of coal to carry a ton one mile!

"I asked Mr. Edison what, in his opinion, was the practical speed limit on the horizon of electrical locomotion, and he answered, 'Perhaps 150 miles an hour.' He made at Menlo Park one of the first important experiments in electrical railways, exhibiting one in 1882 that carried cars 40 miles per hour. But before we come to moving heavy trains by electricity, to which there are serious, though not insuperable obstacles, he believes that we shall shoot our mail through the country by some electrical device, of telpherage construction possibly.

"The terrible danger of collision with icebergs will be lessened through an application of that same small carbon button which registered a millionth of a degree of heat. An apparatus has already been arranged to effect this—the nearing bergs announcing their presence through the increasing cold, which the tasimeter records. Collisions and other dangers of navigation are rendered much less formidable, too, by the powerful electric search lights, equal to many thousand candle power, that disclose objects for miles about in their mighty glare.

"A hundred years hence we shall almost certainly be flying. The greatest difficulty at present in the way of that pleasing performance is the weight of the motor and fuel relative to the power necessary. The chemical production of electricity will sweep away that obstacle by making possible the construction of motors weighing but a small fraction of the lightest now constructed, and by effecting an even more decided saving in fuel.

"As one result of the flying machine among the many which it will affect even revolutionary in character, a writer has pointed out that we shall probably be delivered from the institution of war, since such terrible destruction will be possible with a corps of fighting aeroplanes that no nation will dare to risk it.

Farming by electricity has been successfully tried in the Southern States, and it is not improbable that we shall see the agriculturist of the future sawing his wood, cutting his ensilage, shelling his corn, threshing his wheat and running his creamery with power from a small electric plant owned in cooperation with a half dozen of his neighbors.

"We should be whisking our heavy baggage, too unwieldy for the aeroplanes, through the country by electricity applied to some telpherage or other system. We shall be cooking by electricity, and heating and lighting our houses, our cars and our ships. We shall not only cook our meals; we shall probably serve them, too, to judge from an experiment made not long ago in Baltimore with much éclat.

"If we hear by electricity—through the telephone—why, do these undismayed men ask, can we not see at a distance by the same agency? The vibrations of light are, to be sure, many times more rapid than those of sound; but it is merely a question of obtaining a diaphragm which will respond to those vibrations. May we not look forward to seeing, from our easy arm-chair in New York, the latest drama at the Théâtre Français?

"And since hearing is but a tickling of the brain by vibrations, may we not, if our apparatus for introducing these vibrations to the brain-centers gets out of order—if, in short we are deaf—lead the impulses to the brain through the bones of the head, by electrical means?"

To show how rapidly progress is being made in electrical science we quote one paragraph from an account in the *World Almanac* for 1896 of the progress in this science made in 1895:

"Power transmission by electricity experienced a veritable boom during 1895. The cheapest method of generating electric current to-day is by means of water-power, which is made to drive water-wheels, these in turn operating dynamos. Companies are being organized all over the country to develop the power of every available waterfall. The great advances made in the last few months in the perfection of what is known as the 'multiphase' or 'polyphase' system, has rendered it possible to transmit current to places many miles distant from the water-power. The longest distance over which current is transmitted is 30 miles, at Bodie, Cal. At Sacramento, Cal., 3000 horse-power is transmitted 20 miles. During the year about

30 plants were installed to transmit from 100 to 10,000 horse-power over distances varying from one quarter of a mile to 15 miles. All these employ the alternating current in one of its many forms. The completion of the great plant of the Niagara Falls Power Company, which utilizes the immense power of Niagara Falls for the generation of current, was fittingly celebrated early in the year. The ultimate capacity of this plant as now built is 100,000 horse-power. The Company is already supplying over 10,000 horse-power to manufacturing plants which have been established at the Falls, and it is expected that Buffalo, and perhaps even New York City, may receive electricity from the same source."

Thus realizing the immense part that electricity has to play in the future, it becomes of infinite moment to ask who shall own these important powers. Is electrical invention to add but another instance of the truth of John Stuart Mill's assertion (*Political Economy*, Book IV., chap. vi.) that "hitherto it is questionable if all the mechanical inventions yet made have lightened the day's toil of any human being"? Is the motor man on an electric car better off than the driver of a horse car? He has more responsibility and care. Is he at all proportionally better remunerated? It is worth noting that there have developed in the United States electric trusts and combinations with vast capitals and extended monopolies.

ELECTRIC LIGHTING, MUNICIPALIZATION OF.—(For the general principles involved, see NATURAL MONOPOLIES; MUNICIPALISM; SOCIALISM.) We present in this article a study of the facts from standpoints favorable and unfavorable to municipalization. From the favorable standpoint we quote some tables and portions of an article by Robert J. Finley in the *Review of Reviews* for February, 1893. Says Mr. Finley:

"Altho it has been less than six years since the field of electric lighting was first entered by the municipality, more than 125 cities in the United States now own and operate plants. The movement has not been a local one. It has extended across the country from Bangor, Me., to Galveston, Tex. So far this movement has been confined chiefly to the smaller cities, but the larger cities are beginning to discover that the element of size is not necessarily a bar to their entrance upon the same course. . . .

"The number of cities owning electric lighting works would be even greater than at present were it not that in many States municipal corporations are prohibited by constitutional provisions from incurring debt beyond a small per cent. of the taxable basis of the community. Inability to issue bonds prevented Milwaukee in 1880 from establishing a city plant. Almost invariably when cities thus restricted in their debt-creating power have applied to the legislature for privilege to borrow money with which to construct works, representatives of private corporations have been on hand to oppose and, if possible, to defeat the bills. . . .

The statistics and information relating to municipal ownership, given in this article, have been obtained by direct inquiry and are based upon official and authoritative statements coming from the various cities owning electric-lighting plants. They are taken as the result of many facts secured—as to cost and full capacity of city plant, value of property occupied, number and candle-power of arc lights, and number of lights burned, and cost of each to the city.

Cost of Municipal Electric Lighting. Of 75 cities from which data were gathered only 23 furnish facts from which the cost of operation and the value of the plants and buildings can be determined, and for these it has been found necessary, for purposes of completeness and accuracy, to tabulate the operations of the plants for the fiscal year 1889-90. The returns for the succeeding years show, so far as they are conclusive, that the cities have been able to reduce the cost much below the average given in Table I.

"From this table it is seen that the average cost of each arc light owned and directly operated by 25 cities is \$53.04 a year. In the case of only three or four of the cities does it appear that interest on the investment has been included. Obviously, account should be taken of both interest and depreciation of property, which items, computed at 12 per cent. of the total value of the 23 plants and buildings, would add \$33.60 to the first cost, making the average final cost to the 23 cities operating electric lighting plants \$86.64 per arc light per year.

"There is one important factor that has not been considered in this cost—namely, the profits which many of the cities receive from light supplied to private and commercial houses. Staunton, Va., for instance, in addition to lighting its streets, derives a revenue from this source almost equal to the cost of operating its plant. Hannibal, Mo., draws an income of \$4000 a year from rented lamps, and Chariton, Ia., it is said, earns \$15,000 a year in the same way. Eighty dollars per light per year will be found to be much nearer the real cost of municipal electric lighting in the United States, if the receipts from commercial lamps are deducted.

"Table II. gives the contract prices paid by 29 cities to private electric lighting companies during the same period covered by Table I. It is compiled from a Government report on gas and electric lighting, published as *Senate Miscellaneous Document, No. 56, Fifty-first Congress, Second Session*, and the aim in its preparation has been to select from the parts of the country in which the 23 municipal works are situated private plants having the same arc light capacity. For instance, Peoria, Ill., with a capacity of 233 arc lights, is set over against Bloomington, Ill., with 240 arcs. Twenty-nine cities rather than 23 have been taken, for the reason that in six of the cities most nearly fulfilling the conditions upon which the selections were based, the cost appears to be abnormally high. The average yearly price charged for each of the arc lights by the 29 private companies is shown to be \$106.01, or nearly \$20 a lamp more than it costs the 23 cities to supply themselves with this service. This price is only \$2.79 greater than the average charged by all the private companies, large and small, in the 22 States covered by the tables, and cannot be regarded as due to exceptional conditions.* Most of the contract prices given for the private lamps still obtain, and therefore the two tables fairly represent the present relative costs under municipal and private control. The number of hours each plant was operated is given in the tables for the benefit of those who care to make a more detailed comparison.

"This comparison of city and private plants of equal arc light capacity, and subject to the same territorial conditions, is the fairest that can be made, excepting, perhaps, that between the cost of the same light under the two systems. Fortunately even this test can be applied, as several of the cities now owning works were previously to assuming control furnished with light by private corporations. Until March, 1889, the city of Elgin, Ill., paid local companies at the rate of \$266.66 per arc light per year for service with which it now supplies itself for less than one quarter of this sum. Municipal electric lighting costs Lewiston, Me., only one third, and Galveston, Tex., one half the contract prices these cities formerly gave to private companies. Bangor, Me., saves \$100 per light by the change, and so on. If the reports of the mayors of various cities having had such an experience are to be believed, the change has, in every instance, brought more efficient service, with one or two exceptions, due to special and temporary causes.

"Many of the municipal electric lighting plants are operated in connection with municipal water works, and this is one of the chief reasons why cities furnish themselves with light more cheaply than private companies perform this service. By uniting these two services the running expenses of the plant are made comparatively light. One building often suffices for both water and lighting plants, and the same power is utilized. Several cities have found it necessary to add only two or three employees to the water works force.

"Then, too, the municipal plant is not operated for profit, while the prices of the private companies are regulated to yield a return on the investment. Often

* The list given in the Government report on Gas and Electric Lighting was taken as the basis of calculation.

Comparison of Prices Charged.

the item of profits represents the only difference between the cost of municipal and of private electric lighting.

"But even if companies could do the lighting as cheaply as municipalities, it is a doubtful question whether or not they would. Electric lighting is one of the services the rates of which are practically precluded from the regulating influence of competition. On account of the limited number of companies that can

operate in the same territory at one time, free and natural competition is made impossible. Rival companies occupying the same field may induce a temporary lowering of the price, but the causes which render competition inoperative make easily possible a combination of the one, two or three companies; and no one needs to be told that in the end, if not at the time, the consumer pays for the multiplication of engines, dynamos, lines and linemen.

TABLE I.

CITIES OPERATING ELECTRIC LIGHTING PLANTS.	Number of Arc Lights, 2,000 Candle-power.	Period of Illumination.	Total Cost of Plant, including Buildings.	Cost per Arc Light per Year.
Little Rock, Ark.....	111	8 hours.	\$35,000	\$54.00
Aurora, Ill.....	81	7 hours, 36 minutes.	43,000	66.69
Bloomington, Ill.....	240	All night.	80,000	50.00
Decatur, Ill.....	61	Dark nights.	21,000	49.18
Elgin, Ill.....	80	10 hours.	23,000	43.00
Moline, Ill.....	80	All night.	21,000	53.00
Paris, Ill.....	60	7 hours.	9,600	40.00
Madison, Ind.....	85	Moon, all night.	25,000	58.50
Popeka, Kan.....	184	All night.	50,000	97.50
Bowling Green, Ky.....	60	Moon, all night.	15,000	50.00
Bangor, Me.....	140	All night.	35,000	45.00
Lewiston, Me.....	100	Moon, all night.	15,000	54.75
Bay City, Mich.....	143	Moon, all night.	30,000	58.00
Ypsilanti, Mich.....	80	Moon, to 1 A.M.	24,000	23.60
St. Joseph, Mo.....	208	8 hours.	55,000	72.00
Gallon, O.....	73	Moon, all night.	23,000	35.00 (est.)
Marietta, O.....	65	Dark to midnight.	13,000	36.00
Chambersburg, Pa.....	62	6 hours.	34,500	45.00
Easton, Pa.....	82	All dark nights.	20,000	87.00
Meadville, Pa.....	74	7 hours.	20,000	47.43
Titusville, Pa.....	60	10 hours.	9,000	40.00 (est.)
Galveston, Tex.....	175	7 hours.	40,000	87.60
Staunton, Va.....	50 { 1200 candle power. }	10 hours.	17,000	24.00
Average cost per light per year of arcs operated by 23 cities.....				\$53.04
Interest and depreciation at 12 per cent. total cost of plant and buildings of 23 city-owned electric lighting works, per light.....				33.60
Total average cost per light.....				\$86.64

TABLE II.

CITIES SUPPLIED BY PRIVATE COMPANIES.	Number of Arc Lights, 2,000 Candle-power.	Period of Illumination.	Contract Price per Arc Light per Year.
Texarkana, Ark.....	31	All night.	\$160.00
Danville, Ill.....	80	As ordered.	80.00
Jacksonville, Ill.....	71	Moon, all night.	96.00
Joliet, Ill.....	121	All night.	124.00
Peoria, Ill.....	233	Moon, all night.	145.00
Springfield, Ill.....	130	Moon, all night.	137.00
Streator, Ill.....	60	All night.	96.00
Kokomo, Ind.....	56	All night.	100.00
Logansport, Ind.....	85	Moon, all night.	100.00
Arkansas City, Kan.....	35	To 12 P.M.	72.00
Fort Scott, Kan.....	75	Moon schedule to 1 A.M.	80.00
Owensborough, Ky.....	32	Moon schedule to 1 A.M.	110.00
Augusta, Me.....	68	9 hours.	76.33
Bath, Me.....	31	To 1 A.M.	125.00
Grand Rapids, Mich.....	120	All night.	109.50
Lansing, Mich.....	100	Moon, all night.	100.00
Kansas City, Mo.....	128	All night.	200.75
Sedalia, Mo.....	92	Moon, all night.	87.00
Springfield, Mo.....	54	Moon, all night.	136.00
Bellaire, O.....	52	Moon, all night.	90.00
Tremont, O.....	70	All night.	90.00
Hillsborough, O.....	63	Moon, all night.	70.00
Allentown, Pa.....	98	All dark nights.	100.00
Lebanon, Pa.....	60	To 12 P.M.	80.00
Newcastle, Pa.....	50	All night.	80.00
South Bethlehem, Pa.....	55	Moon to 12 P.M.	81.82
Dallas, Tex.....	165	All night.	95.85
Houston, Tex.....	92	All night.	150.00
Parkersburg, Va.....	58	All night.	102.00
Average cost per light per year of arcs operated by 29 private companies.....			\$106.01

NOTE.—All night, 10¼ hours. Moon, all night, 6 hours. Till 12 o'clock, 5¼ hours.

The argument against municipal lighting is usually based on the corruption of city governments and the undesirability of extending officialism and bureaucracy. (For this general argument, *pro* and *con*, see INDIVIDUALISM ; SOCIALISM.) We quote here an article on *Cost Statistics of Public Electric Lighting*, by Victor Rosewater (Publications of the American Statistical Association, vol. iii) showing what can be said against statistics which prove the desirability of municipal ownership. Mr. Rosewater says :

"Among the various papers published upon the subject of municipal control of public electric lighting the showing made by the statistics of cost is always an important factor. Whatever be the point of view of the writers, they seem to present their own figures and yet to arrive at essentially inconsistent results. What I propose to do here, then, is simply to touch upon a few of the limitations which must be borne in mind by any one who wishes to give these statistics their due scientific weight.

"What is the cost of an electric street lamp to a city? The answer naturally suggesting itself would be that it is the contract price paid to the lighting corporation. This is evidently the idea that controlled the officials of the Eleventh Census when they compiled the materials for Census Bulletin No. 100. No extended consideration is needed to lead to the conclusion that these figures are absolutely without significance. The fatal defect lies in the fact that they do not show the amount of lighting service. In one place the lamps may burn but 5 hours nightly for only 20 nights in the month ; in another they may be operated all of every night. Even overlooking minor omissions, which will be pointed out in a moment, any comparison of absolute contract prices is fallacious at the outset. . . .

"Leaving aside the census bulletin, we may, nevertheless, still find an authoritative presentation of contract prices of public electric lighting that does not have its chief merit in giving too little information. I refer to a report of the Engineer Commissioner of the District of Columbia.

"Here, notwithstanding the fact that only those cities have been selected in which the lamps burn a period popularly known as 'all of every night,' the actual period of illumination is given in each instance. We also have data upon several collateral points. But to compare the cost of an electric lamp supplied under a 10-year contract with that of one supplied under monthly agreements cannot be strictly accurate.

"Again, the location of the wires may be a factor influencing the cost of street illumination to a city, in which the municipal authorities compel the franchised corporations to place their wires under ground. What they in fact do is to compel an increased capitalization of the private company in order to meet the extraordinary expenditure. . . .

"Analogous to the distinction just noted are the differences founded in the location of the lamps. These differences take on three distinct forms with reference to the system of hanging, with reference to the number of lamps, and with reference to the relative profitableness of the district. . . .

"If we turn now to the cost statistics of electric lighting under municipal ownership of the plant, we strike a set of complications no less serious. At the very beginning of every such investigation we find ourselves in the chaos of American municipal book-keeping. When no two cities employ the same system of accounts, when in the same city the reports of different departments furnish irreconcilable data, the statistician must seek to extricate himself as best he can. It would scarcely be stating the case too strongly if we should say that out of the probable 150 municipalities owning their own electric lighting plants not 5 could present an intelligible showing of their operations for the period of one year. The blame for this does not attach entirely to the city officials, for conditions exist in many localities which render a clear financial account a thing next to impossibility.

"The special difficulties arising in this connection are of a twofold character—those relating to the cost of the installation, and those relating to the annual operating expenses. In most instances the bonded indebtedness incurred for the particular purpose does not cover the entire capital outlay. To add in the proper amount of interest charges requires, then, an assumed capitalization. Where the plant is conducted

in conjunction with other monopolies of service, with the water-works, for example, we have a system of joint production which defies a statistical separation of expenditures. The same obstacle presents itself in relation to the operating expenses. . . .

"It has sometimes been attempted to compare the cost of electric lighting in the same city under contract with private companies and under municipal ownership. Figures of this kind are valid so far as they go. But even where the city changes from one régime to another, by buying out the private corporation or by constructing its own plant, we can never be certain that the conditions remain unchanged, that we are comparing similar services. Mr. R. J. Finley has, in a recent magazine article, adopted still a different procedure. He has compiled two tables representing the two systems, each table showing the cost of lighting in a number of cities specially chosen with reference to geographical situation and industrial conditions, in order to counterbalance the one against the other. The plan is ingenious. Sufficient data are given to convey a comprehensive idea of the situation, but Mr. Finley also gives way to the irresistible impulse to generalize with an average. His average, like the others, is misleading and meaningless.

"If this review of the cost statistics of public electric lighting can serve any useful purpose, it must be to emphasize the fact that in such matters simplicity is deception. It is useless to seek to represent a complicated process by a single numerical figure. The statistics themselves are valuable, but must be employed as bases of comparison only with the utmost care, and with due allowance for the many limitations which affect their accuracy."

It will be seen that Mr. Rosewater does not question the correctness of Mr. Finley's facts which we have given above, only warning us against general averages and broad statements. Perhaps the best means of arriving at the truth, however, is comparing the experiences of the same cities under private and municipal operation. Care must be taken, as Mr. Rosewater says, in instituting this and all comparisons ; but with due care it is instructive. Professor Frank Parsons, in a series of articles in the *Arena* for 1895, gives the following table as to the cost per lamp before and after public ownership, the "after" service being the same as or better than the service it replaced :

	Before.	After.
Bangor, Me	\$150	\$48
Lewiston, Me	182	55
Peabody, Mass	185	62
Bay City, Mich	110	53
Huntington, Ind.	146	50
Goshen, Ind	156	77
Bloomington, Ill.	111	56
Chicago, Ill.	250	91
Elgin, Ill.	266	43
Aurora, Ill.	326	70
Fairfield, Ia.	378	70
Marshalltown, Ia.	125	27
Jacksonville, Fla.	24	5

Of this table he says :

"The statements rest upon official reports and returns of municipal officers. The figures of the "after" column represent the cost per lamp per year as ascertained in the first two or three years after public ownership began, except where subsequent years show a higher cost than the early years, in which case the said higher yearly cost has been taken. As a rule the cost in later years is less than the cost in the first years of public ownership ; for example, the present cost per lamp per year in Bangor is only \$24, in Lewiston, \$43, in Bay City, \$46, etc. The case of Chicago is peculiar. The public plant was started in 1887. Census bulletin 100 places the cost in Chicago at \$68 per lamp, but this is the average rate for all the electric lamps, rented as well as public, and of all candle powers. Professor Ely's *Problems of To-day*, third edition, in an appendix

written in 1890, puts the cost in Chicago at \$55. In 1893 and 1894, the department reports make the cost \$96.

"The public-owned Chicago electric-light plant works under a great disadvantage from not being able to secure from the legislature a permit to sell commercial light. Therefore it has only one lamp for each 500 feet of wire. A mile of wire dissipates as much energy as a 2000 candle-power light. The men are only worked eight hours, are paid \$2 a day, and two shifts are employed, while the private plant works one shift and pays less—\$35 to \$50 a month. The private company lights 56 lamps for \$137 each, in the district where wires have to be buried, and by a new contract 230 lamps at \$105 a year each in other parts of the city. The cost of the city-owned lights, nearly all of which are in the district where wires have to be buried, is about \$96, and would be much less if the plant could be fully utilized.

"All the plants of this table confine themselves to street lighting, except the Peabody and Jacksonville plants. In Peabody the superintendent is able to separate with satisfactory accuracy the cost of the street lamps from the cost of commercial lighting. In Jacksonville, the lamps are incandescent. The private company has been charging \$24 a year for all-night service. The public plant, which has just been built,

offers to supply the same service at \$9, and the cost of operation is estimated at less than \$5 a year. The commissioners have carefully studied the workings of municipal plants, and are confident of a good profit at the prices they advertise. The plant does not aim to be entirely cooperative—it is cooperative in respect to the street lamps, but expects a profit from commercial lighting. This expectation of the commissioners is fully confirmed by the tables in the next section of this report. All the plants of the table except that of Jacksonville have been a considerable time in operation, and the figures given are the results of actual experience on the spot. Most places that possess municipal plants did not have any electric light until the public plant was built. If it had not been for this circumstance, the table would be much longer than it is."

The lighting of streets in many cities costs the public nothing, for the municipally owned plants allows them to sell light and meet the expense of street lighting from the profits. Professor Parsons gives the following table of public plants in three groups, whose profits partly meet the cost, wholly meet the cost, and more than meet the cost :

GROUP A.

	Profit.	
St. Clairsville, O.....	\$28	2,000 candle-power average 9 hours a night.
Swanton, Vt.....	10	2,000 candle-power all night, moon.
Chehalis, Wash.....	8	2,000 candle-power all night, every night.
Indianola, Ia.....	7	1,200 candle-power average 6 hours.
Wellston, O.....	7	1,200 candle-power average 6 hours.
Grand Ledge, Mich.*.....	6½	
Madison, N. J.....	12	Incandescent 30 candle-power.
Newark, Del.....	4	Incandescent.

* Grand Ledge is taken from Professor Ely's figures, and Chehalis from Director Beitler's report to the Philadelphia Councils; the rest are from returns made directly to me.

GROUP B.

	Profit.	
Albany, Mo.....	"Commercial lights pay all expenses" (30 street lamps 1,200 candle-power burned all night).
Batavia, Ill.....	"Costs nothing—all expenses paid by commercial light" (120 street arcs all night).
Crete, Neb.....	"Commercial lamps more than pay expenses" (50 street arcs 1,200 candle-power till midnight).
Council Grove, Kan.....	"Commercial lamps pay all expenses—operation and interest."
Middleton, Pa.....	"500 incandescent pay all expenses."
Oxford, O.....	"1,300 incandescent pay for the street lamps."
St. Peter's, Minn.....	"Lights cost nothing—1,000 incandescent pay all expenses."

GROUP C.

	Profit.	
Farmville, Va.....	\$340	Above all expenses, fixed charges, and operating, and giving the city free 25 full arcs averaging 6 hours per night.
Luverne, Minn.....	520	Above all operating and fixed charges, and 12 street arcs, free, of 2,000 candle-power.
Falls City, Neb.....	650	Above all operating and fixed charges, and 150 street lamps free.
Rockport, Mo.....	900	Above all operating and fixed charges, and 65 street lamps free.
Alexandria, Minn.....	Blends the light and water accounts. The report for the year ending March 1, 1895, puts interest and operating expenses at \$5,896 for the combined departments. The income of the departments, aside from taxes, was \$6,052.

Professor Parsons says :

"We are only on the threshold yet. Our towns and cities are just beginning to see the virtues of combining commercial lighting with their street work. The business is developing rapidly, and in a few years a city that levies taxes to pay for its street lamps will be

regarded as a lingering relic of an embryonic age. In time we may even do as well as Berlin and Paris, which make the city franchises pay 18 and 22 per cent, respectively, of all municipal expenditures. I hope we shall do better; I hope to see the day when public business will pay the whole volume of public expenses.

"One more point the committee must make in this section. The transfer of business from private to public plants is a benefit to consumers as well as to those who pay taxes. To a large extent the two classes are one, and a man who buys light for his store or his house, and helps with the street-lighting tax, is doubly benefited by the public plant, once by the diminution of taxes, and once by the cheapening of commercial light.

"Braintree, Mass., sells incandescents at six mills per meter hour and $\frac{3}{4}$ to \$5 a year. St. Clairsville sells incandescents, 16 candle-power, at two-fifths of a cent a meter hour, or 40 cents a month. Farmville charges 50 cents a month. Swanton, Vt., sells incandescents, 16 candle-power, at one to three dollars a year, or one-third of a cent an hour by meter, and 2000 candle-power arcs at \$5 a year. In Boston the citizens have to pay 50 to 70 cents a night, or \$12 to \$328 a year for an arc, and one cent per hour by meter, or \$10 a year, for an incandescent 16 candle-power.

"Public lighting not only reduces the cost of street lamps one half, two halves, or even three halves, but it lowers the cost of commercial light also about one half on the average, and, in some cases, a great deal more than that.

"How is it that public plants are able to make such tremendous savings?' The reasons are many; here are some of them:

"1. A public plant does not have to pay dividends on watered stock.

"2. It does not have to pay dividends even on the actual investment.

"3. It does not have to retain lawyers or lobbyists, or provide for the entertainment of councilmen, or subscribe to campaign funds, or bear the expenses of pushing the nomination and election of men to protect its interests or give it new privileges, or pay blackmail to ward off the raids of cunning legislators and officials, or buy up its rivals, etc.

"4. It does not have to advertise nor solicit business.

"5. It is able to save a great deal by combination with other departments of public service. The mayor of Dunkirk says: 'Our city owns its water plant, and the great saving comes from the city's owning and operating both plants. No extra labor is required but a line-man. The same engineers, firemen, and superintendent operate both plants, and the same boiler power is used.' So in Bangor, Marshalltown, and a number of other places, the municipal lighting system is run in connection with the public water plant. In La Salle the fire, water, and light departments are consolidated. A great saving in the cost of labor and superintendence results. The larger the cooperation under a single skilful management, the greater the economy and efficiency, other things being equal. The plants in Allegheny, Easton, West Troy, South Norwalk, Peabody, Danvers, and Braintree do not have this advantage of combination.

"6. Public ownership has no interest to pay. Even if the people do not own the capital, but borrow it, they can get the money at much lower rates of interest than private companies have to pay. Boston, New York, and Philadelphia can borrow at 3 per cent—have borrowed many millions at that rate. Dunkirk borrows at the same rate; Allegheny pays $\frac{3}{4}$ per cent. when she borrows; Easton, West Troy, South Norwalk, Peabody, Braintree, etc., 4 per cent. Few places have to pay over 5 per cent. There is no debt on the Dunkirk, Allegheny, or West Troy plants, but these are the rates those cities pay when they borrow. As a rule, private companies are obliged to pay from 2 to 4 per cent. more than the municipality in which they are located. The Boston Electric Light Company reports its interest payments at 6 per cent—3 per cent higher than the rate at which the city can borrow. The average interest paid on borrowed money by the private companies in Massachusetts is between 7 and 8 per cent., while the average at which the towns and cities of the State are able to borrow is between 4 and 5 per cent.

"It is not to be expected that private companies will sell as cheaply as public; with equal efficiency of management it costs them more to produce light, and they must have interest and profits. A private company is run, not for the benefit of the people, but for the profit of the owners. It is perfectly natural for an electric-light company to make all the money it can; that is no more than is done by the majority of business men and corporations in every line of trade."

(For references, see MUNICIPALISM.)

ELLIOT, EBENEZER, the *Corn Law* *Rhymer*, was born at Masborough, near Shef-

field, in 1781. The son of a manufacturer of the somewhat rough early type, he received little education, but read widely and early wrote verse. Entering business himself, he met with some success, but also with losses, which he laid to the Corn Laws. He developed a fierce indignation against the law that had kept him poor as an employer, and that pressed so hardly on the workers whom he wished to benefit. In *The Splendid Village*, *The Village Patriarch*, and, above all, in *The Ranter*, the reader feels the depth of his feeling for the poor and his hatred of the landlord class. In the *Corn-law Rhymes* (1831) the whole of his bitter anger breaks out, and made the famous rhymes play no small part in the agitation which finally abolished the Corn Laws. He died soon after seeing their abolition in 1849.

ELLIS, HAVELOCK, was born at Croydon in 1859. He spent some years of his early life in the Australian bush. Tho prepared for the medical profession, he has given his attention mainly to scientific and literary studies. He was one of the founders of the Fabian Society and the New Fellowship. He is general editor of the Contemporary Science Series. His main writings are *The New Spirit*, *The Criminal*, *Nationalization of Health*, and *Man and Woman*. Mrs. Ellis (née Edith Lees) is secretary of the New Fellowship, a lecturer on social subjects, and author of *A Novitiate for Marriage*, *Democracy in the Kitchen*, and *The Masses and the Classes*.

ELMIRA REFORMATORY, NEW YORK.—The sociological experiments and reports arrived at in Elmira Reformatory, New York, are of such importance as to entitle it to an article apart from the general consideration of penal reform. (See PENOLOGY.)

The initial official step taken toward the establishment of the Reformatory was the creation in 1869 by the Legislature of a Commission "to locate a State penitentiary or industrial reformatory in the Sixth Judicial District."

The first inmates were received on July 24, 1876, being transferred from Auburn prison. Thereafter most of the work of construction was carried on by prisoners. The institution did not take its distinctive position in the prison system of the State, however, until April 24, 1877, when the bill providing for the "indeterminate" sentence was incorporated in the statutes.

According to this bill, convicts sent to Elmira cannot be sentenced for any definite term, altho a maximum term can be given. The length of residence of the convict is left wholly to the decision of the management, and this gives the key to the whole institution. On his arrival the convict is carefully examined as to his history, mental and physical characteristics, and all circumstances of his case, and is then treated as a moral patient, built up into self-supporting character as rapidly as possible, and only allowed to go out (unless the maximum term intervenes) when in the opinion of the management he is capable of self-supporting citizenship. He is, however, even then only allowed to go out for the first six months on parole,

System.

being kept in close correspondence with the management until he has proved himself worthy of absolute freedom.

Such is, in brief, the thought of the Reformatory. But the way the convicts are built up into character is by teaching the convicts to work. In 1888 the New York Legislature passed the Yates Bill, practically prohibiting the industries then being carried on at Elmira by the convicts, and absolutely forbidding the application of power machinery to such prison labor in order to prevent its competition with outside labor. It forced the prisoners into immediate idleness, and the management scarcely knew what to do. But in a few hours the whole industrial life of the institution was revolutionized. Hitherto the idea had been to carry on industries partly for the good of the convicts, but largely to pay expenses. Now all thought of making profit was given up and industrial classes were commenced simply for the good of the men. The whole mass of convicts, too, for sake of exercise, were brought out and drilled in military exercise. The result of both measures has been good beyond all expectation. The military exercise gives the convicts a carriage and bearing, both mental and physical, that makes them wholly different. To-day they form a notable regiment of men, organized, officered, and commanded by those convicts proving themselves the most worthy, and with their own band, and all appointments of a regiment.

The following account of the Elmira method we abridge from the Reformatory *Year Book*, mainly written and printed by the convicts:

All individuals committed to the Reformatory, except those sentenced by federal courts within the State of New York, are brought to the institution by its transfer officer.

The neophyte usually has an opportunity for several hours' calm contemplation before he is called from his cell for his first conference with the General Superintendent. At this meeting he is subjected to a searching examination of his whole history, being called upon to furnish for the records all the facts within his ken relating to his parentage, early environment, personal habits, and present ambitions. The information adduced as to progenitors often has an influence in deciding the trade to be taught to the novice, who is usually unaccustomed to and unskilled at labor, and who seldom evinces any choice. The class of manufacturing mostly carried on in the vicinity to which the man is likely to go upon his release is also an important factor in the arrangement of trades instruction. The prisoners are divided into three classes or grades, determined by the character of the men, their conduct, industry, and studiousness being factors in securing promotion or retrogradation.

The grades are styled the Upper First, the Lower First and the Second. Tyros are inducted to the Lower First grade. They take their meals in their rooms. By maintaining a good record for six successive months they may advance to the Upper First grade, from which alone they may secure release prior to the expiration of the maximum term for which they can be imprisoned. Their cells are more commodious, they are provided with spring beds, and they eat at tables in a large dining-room. From their ranks are chosen the officers and most of the non-commissioned officers of the regiment, as well as the monitors in the shops and the turnkeys on the cell blocks. If their

records continue perfect another six months they become candidates for conditional release, the *ultimatum* being a vote of confidence by the Board of Managers and the securing of satisfactory employment.

The downward step from the Lower First grade leads to the Second, or convict, grade. Into this drop the Lower First grade men whose conduct, school, or labor records are imperfect for two or three months in succession, and men of both divisions who are guilty of insubordination or any serious infraction of rules, or who are detected in the commission of an act evidencing a spirit hostile to law and government. Those who are reduced to this class forfeit all credit marks and may only secure readmission to the next higher grade to take a fresh start for the parole goal by earning a perfect marking for three successive months. Those who fall to the Second grade a second time may not emerge from it for six months, and the third degradation is not followed by advancement for a year. Its wearers are quartered in the smallest cells, are deprived of all room furniture not essential to health and cleanliness, have no sheets on their beds, receive no tea and coffee with their rations, lose the privilege of drawing literature of any kind from the library, and lose their right to receive trades instruction as such.

The engagements of each inmate are intended to absorb his thoughts completely during most of his waking moments, and they are sufficiently varied, tho systematized. The program is varied for individuals. There are those who are employed at productive labor or in domestic service. A majority of

Classes.

the trades-school pupils spend a portion of two days a week in the drawing-class room. Wednesday and Saturday afternoons work is suspended in the shops and trades-class rooms and the four hours are devoted to drilling and military ceremonies. There are evening class meetings for every man as often as twice a week, and for those most nearly illiterate and those taking special courses as often as four times a week. On Sundays there are classes in ethics. There are kindergarten classes for the underwitted, classes for the others in all branches of study, from elementary subjects to the higher sciences and philosophy. The elementary classes are usually taught by advanced convicts. The main classes are, however, industrial. There are classes in bricklaying and plastering, blacksmithing, horseshoeing, bookbinding, barbering, baking, brass finishing and molding, boat-building, carpentry and cabinet-making, electricity, fireman's work, fresco-painting, wood-finishing, machinery, molding, plumbing, printing, pattern-making, photograph, stone-cutting, stenography, shoemaking, steam-fitting, stained-glass setting, tailoring, tinsmithing, typewriting, upholstering, wood-carving, etc.

Careful instruction is given in every department, mainly by the convicts themselves. In many workshops containing scores or even hundreds of workers, convicts are the only teachers and convicts the only watch on guard. Much attention is given to physical training. Every convict, on coming in, is physically examined, and then the endeavor is made to develop to the norm that which is abnormal.

The system of physical training, with its accompaniment of massage-bathing, is accomplishing what was expected of it.

Since its opening there has been confined within the Reformatory precinct a limited number of men of a type so abnormal as not to be susceptible of betterment through the application of methods resorted to in the cases of the majority. Morbid minds and undeveloped, poorly nourished and diseased bodies—results of bad environment and vicious habits or the legacy of unhealthy progenitors—had made them stupid, slow, disinclined, if able, to apply their minds to the acquirement of useful knowledge, and generally unprogressive. Many of them are illiterate, and some have so far lost control over themselves as to be ranked not much above idiots. They are utterly incapable

of receiving and retaining impressions with sufficient regularity to make headway in the simplest of trades taught in the technological department, and they are fitted only for inconsequential work in the shops. In conduct they rank with the incorrigibles, often because they have not appreciation of the distinction between right and wrong. They are not to be stimulated by the same motives and ambitions that affect most of those undergoing the rehabilitating course. Loss of privilege by way of penalty is regarded with stolid indifference. For men answering this description and for those suffering from physical defects which may be remedied by systematic muscular effort, the physical training department accomplishes an amount of good that cannot be satisfactorily expressed in words.

One of the more recent steps is the adoption of a wage-earning plan. Each man is credited with his earnings in labor for every full day's work of eight hours at the rate of 35 cents per day in the Second, 45 cents per day in the Lower First, and 55 cents per day in the Upper First grade. This rate is not fixed with reference to an estimate placed upon the value of the labor, but is governed by the legal provision restricting the amount that may be disbursed to inmates to 10 per cent. of the gross earnings of the Reformatory. Fines are imposed for bad conduct.

Wage Earning.

In study, a demerit of \$1 is incurred for failure in any subject where the marking is not below 50 per cent.; below 50 per cent. and not below 25 per cent., \$2; below 25 per cent., \$3.

From his earnings each man is required to pay for what he receives: in board and lodging at the rate of 25 cents per day in the Second, 32 cents per day in the Lower First, and 40 cents per day in the Upper First grade; in clothing, at an established schedule of prices; and in medical attendance, at the rate of 15 cents per visit. While for the present the prices of board are inflexible, a plan is under consideration by which his expenditure in this direction will be placed in the control of each inmate.

It is intended that any total credit balance obtained under this system shall be placed at the disposal of the inmate earning it as a fund to be paid him on his release. This can take place (unless the maximum term of imprisonment be reached first) only by perfect records for a certain period, and the confidence of the management that the candidate is "morally, intellectually, and physically capable of earning a livelihood." In the event of the conditional release being authorized there is still another step prior to its realization: satisfactory employment must be secured.

Parole.

The principal regulations governing paroled men, which are printed on the certificates issued to each, are these:

1. The graduate shall proceed directly to the place of employment provided for him and there remain, if practicable, for at least six months from date.
2. In case he finds it desirable to change his employment or residence, he shall first get the consent of the managers through the General Superintendent.
3. He shall on the first of every month, for the period of six months or more, and until absolutely re-

leased by the managers, forward to the General Superintendent a report of himself certified by his employer or an agent of the managers, which report shall state whether he has been constantly under pay during the month and if not, why not, and how much money he has expended and saved, together with a general and full statement of himself and surroundings.

4. He shall in all respects conduct himself honestly, avoid low and evil associations, and shall abstain from intoxicating drinks.

Each man is advised, prior to his departure, that he need not fear to communicate with the management in case he loses his situation or becomes unable to labor by reason of sickness. He is assured that he may at all times rely upon the aid and counsel of the managers and superintendent, and that, in case of disaster, he may find the Reformatory a desirable retreat. If the terms of the conditional release are faithfully complied with for a period of six months, the Board of Managers, by vote at one of their monthly meetings, grant absolute release, which operates the same as a pardon by the Governor.

The results of the plan are the most favorable. According to the report for 1895, there had been received on the indeterminate term up to September 30, 1894, 6641 convicts.

Results.

Of these 4366 were paroled, the remaining 2272 being either still in the Reformatory, or, having been released by expiration of the maximum term, pardoned out, transferred to other State prisons or having died. Of the 4369 who had been paroled, 3623, or 83 per cent., are reported to have probably reformed; 2616 of these served their complete time of parole and earned their absolute release; 322 were still on parole, while the remaining one half had been lost sight of, but who are counted as having "probably" reformed; 686, or 15.7 per cent., are reported as having probably returned to criminal practices; 303 have been returned to the Reformatory; 140 have been paroled twice; 26 have returned twice; 12 have been paroled three times; and 4 have returned three times.

Beyond this remarkable showing the following statistics are instructive. Of those indefinitely sentenced—

- 12.3 per cent. inherited insanity or epilepsy.
- 38.3 " " drunkenness clearly traced.
- 13.1 " " " doubtful.
- 49.6 " " temperate habits.
- 4.6 " were of pauperized ancestry.
- 76.9 " " " ancestry of no accumulations.
- 18.5 " " " forehanded.
- 54.1 " " " homes positively bad.
- 38.3 " " " " only fair.
- 7.6 " " " " good.
- 58.1 " " " at home up to time of crime.
- 41.9 " " " homeless at " " "
- 19.3 " " " illiterate.
- 48.8 " could read and write with difficulty.
- 28.6 " had common school education.
- 3.3 " " high school or more education.
- 42.8 " " Protestant training or faith.
- 45.6 " " R. Catholic " " "
- 6.3 " " Hebrew " " "
- 4.3 " " none.
- 88.3 " were in good health.
- 1.4 " " deficient in natural capacity.
- 18.1 " " of only fair " " "
- 80.5 " " " good or excellent natural capacity.
- 33.8 " seemed of absolutely no moral sense.
- 41.1 " " " possibly some " " "
- 20.9 " " " ordinary " " "
- 3.2 " " " specially susceptible moral sense.
- 93.6 " had committed offenses against property.

6.6	per cent.	had committed offenses against the person.	
4	"	had committed offenses against the peace.	
56.9	"	were between	16-20 when admitted.
33.0	"	"	20-25 "
10.1	"	"	25-30 "

The cost of maintenance for 1892 was \$198,454.34. Of this \$7208.63 was for prisoners' transportation; \$3801 for cost of schools; \$7596.63 for physical and other training. The incidental and other income was \$40,019.72. The operation of the farm during the year yielded \$5452.28. The per diem maintenance cost was 38.9 cents. The number of inmates September 30, 1892, was 1396. The *Year Book* of the Reformatory, bound, printed, and, in fact, written by the convicts, can be had ordinarily on application. The closing sentence of one *Year Book* says: "The time will come when every punitive institution in the civilized world will be destroyed, and all places for the treatment of crime be hospitals, schools, workshops, and reformatories." (See also PENOLOGY; CRIME.)

ELY, RICHARD THEODORE, Ph.D., LL.D., Director of the School of Economics, Political Science, and History of the University of Wisconsin, and one of the best-known and popular American writers on social and economic questions, was born in Ripley, N. Y., April 13, 1854. Until 18 he lived in the country, working on a farm of which, for a time, he had entire control. His father was a civil engineer, and for some time he was employed on his engineering corps in laying out a railroad. After completing the course of the State Normal School he entered Dartmouth College, going from there to Columbia College, where he was graduated in 1876. As holder of fellowship of that institution he continued his studies in German universities, receiving the degree of Doctor of Philosophy from Heidelberg in 1879.

A year after his return to America he was called to Johns Hopkins University, where he was Professor of Political Economy until 1892. In 1892 he resigned from the Johns Hopkins University to take the position he now holds at the University of Wisconsin.

Professor Ely has made a record of incessant activity as university professor and lecturer. But the pressure of academic duties has not prevented Dr. Ely from engaging in fields of practical activity. More than any other man he was identified with the formation of the American Economic Association.

In Baltimore he was for one year (1885-86) a member of the city tax commission and for two years (1886-88) a member of the State Tax Commission.

Professor Ely has taken an active part in the Chautauqua movement, and has lectured for several years at the annual summer assemblies.

Among other institutes and societies to which he belongs may be mentioned the International Statistical Institute, the Christian Social Union, of which he was the first and a most active and earnest secretary.

Dr. Ely has, moreover, found time to write numerous works and to contribute largely to the leading periodicals and papers, and has

grown into the recognized position of a leader of American public opinion in matters of economics and applied ethics.

He has devoted particular attention to the study of taxation, socialism, the labor question, and municipal government. *Taxation in American States and Cities* and the *Labor Movement in America* represent pioneer work in their respective fields. Others of his works have attained a wide circulation and gone through several editions. These are: *French and German Socialism in Modern Times* (1883); *The Past and Present of Political Economy* (1884); *Problems of To-day* (1888); *Social Aspects of Christianity* and *An Introduction to Political Economy* (1889), *Outlines of Economics* (College edition, 1894); *Socialism and Social Reform* (1894).

Professor Ely has been criticised as a sentimentalist, but has never flinched from his position that political economy ought to be made useful for promoting practical reform and the elevation of the masses. He has been branded as a socialist, which he has steadfastly denied, tho he has continued none the less earnestly to write and speak against monopolies and in favor of every reasonable forward step which could benefit working men.

EMBARGO.—A prohibition affecting commerce by national authority, which has been laid in various forms and at various times by various nations. Formerly ships belonging to a foreign power were placed under embargo in contemplation of war, but in modern times this practice has been discontinued, and the only occasion on which an embargo of ships is now resorted to is when it is sought to use reprisals in the case of any specific wrong committed by any foreign State.

EMERSON, RALPH WALDO, the greatest of American philosophers, was born in Boston, May 25, 1803. He entered Harvard University in 1817, graduating in 1821, and became pastor of a Unitarian Church in Boston in 1829. He resigned in 1832, owing to differences in thought and opinion. After that he lived a retired life, chiefly in Concord, writing many books, lectures, etc., and becoming eminent not only as an author, but also as a lecturer. In the midst of his literary labors he found time to manifest his interest in great public questions as they arose. He was deeply interested in Brook Farm (*q.v.*), tho he never resided there. He was earnest and outspoken in his views against slavery. At Waltham, in 1845, Emerson attacked slavery with no feeble weapon:

"It is certain that, if it should come to question, all just men, all intelligent agents, must take the part of the black against the white man. Then, I say, 'Never is the planter safe; his house is a den; a just man cannot go there except to tell him so.' Nature fights on the other side; and as power is always stealing from the idle to the busy hand, it seems inevitable that a revolution is preparing, at no distant day, to set these disjointed matters right."

In 1844 he had touched upon another crying evil, the seizure of colored sailors of Massachusetts when they went into the ports of Carolina:

"Gentlemen, I thought the deck of a Massachusetts ship was as much the territory of Massachusetts as the floor on which we stand. It should be as sacred as the temple of God. If such a damnable outrage can be committed on the person of a citizen with impunity, let the Governor break the broad seal of the State; he bears the sword in vain. The great-hearted Puritans have left no posterity. The rich men may walk in State Street, but they walk without honor; and the farmers may brag their democracy in the country, but they are disgraced men."

As early as 1838 he addressed a letter to President Van Buren protesting against the wrongs then endured by the Cherokee Indians at the hands of the Government. His anti-slavery speeches, his remarks on the attack made upon Charles Sumner in 1856, his speech in behalf of the Kansas farmers in the same year, his eulogies of John Brown in 1859, his speech of welcome to Kossuth at Concord Bridge in 1852, his speech at the centennial celebration of Concord Fight in 1875, and many other brief addresses, are the fearless utterances of the reformer. He was an active citizen in practical ways, and was punctual in his attendance at the town meetings, where he often took part in debates; yet he sympathized to some extent in the no-government theories of his friends Alcott and Thoreau, influenced by his partly socialistic, partly individualistic philosophy. He died at Concord in 1882.

ENGINEERS. See RAILWAY EMPLOYEES' ORGANIZATION.

EMIGRATION (see also IMMIGRATION) may be defined as the moving of families or individuals from one country or one portion of a country to permanently reside in another land or portion of country. In the form of colonization especially it is as old as civilization. The ancient cities of Troy, Sidon, as well as the better known instances of the Greek cities, repeatedly adopted the expedient of assisted colonization to develop commerce and relieve the overcrowding of the parent city. Back of this and connected with this are the repeated instances of tribes and clans sending out branches and offshoots to settle in some new place. Much of this was connected with military conquest, but such was not always the case. The so-called migration of the nations was in a measure emigration and colonization. In modern times the discovery of the New World led to a renewed outbreak of emigration. The economic and industrial pressure of our own times has led, particularly in the United Kingdom, not only to emigration, but to its preaching by some as a cure for industrial ills.

In England various schemes of State-aided emigration to the colonies were much debated throughout the second quarter of the century, both in and out of Parliament. Such were those to facilitate emigration from the south of Ireland to Canada (1823) and to relieve distress in the Highlands of Scotland (1841). At this time, indeed, the idea of emigration became merged in the more complex idea of colonization.

"Of colonization," writes Wakefield, "the principal elements are emigration, and the permanent settlement of the emigrants on unoccupied land. . . . My fancy pictures a sort and amount of colonization that would amply repay its cost by providing happily for our redundant people; by improving the state of those who remained at home; by supplying us largely with food and the raw materials of manufacture; and by gratifying our best feelings of national pride,

through the extension over the unoccupied parts of the earth of a nationality truly British in language, religion, laws, institutions, and attachment to the empire."

Mill wrote :

"The exportation of laborers and capital from old to new countries, from a place where their productive power is less to a place where it is greater, increases by so much the aggregate produce of the labor and capital of the world. It adds to the joint wealth of the old and the new country what amounts in a short period to many times the mere cost of effecting the transport. There needs be no hesitation in affirming that colonization, in the present state of the world, is the best affair of business in which the capital of an old and wealthy country can engage."

As a result, there has been not only great emigration, but all sorts of plans and legislative acts to aid emigration. Says Palgrave's *Dictionary of Political Economy* :

"In 1815 the number of emigrants from the United Kingdom was 2081, in 1820 it was 25,720, in 1830, 56,907; in that year the Colonization Society was formed; in the next year the first effort was made to regulate emigration; an agent general for emigration and certain 'South Australian' commissioners were the chief centers of authority for some years, and in 1840 the Colonial Land and Emigration Board was established in Downing Street. It had become clear that the matter was one of great interest both to the mother country and the colonies. On the one hand was the theory described as 'shoveling out the paupers,' on the other was the demand that no emigrant should be sent to the colonies except under proper safeguards, and with some guarantee of his fitness. And on the lines which were settled 50 years ago the attitude of the State toward emigration has remained ever since. The activity of societies and other quasi-public influences has, however, been growing, till we are confronted at the present day with the efforts of Mr. Arnold White, Baron Hirsch, and the projects of the Salvation Army. We can now examine in more detail, in the case of our own country, the answers to the questions propounded above."

As regards the stamp of the emigrants from England it is specially noted in 1845 that one half were unskilled laborers, and four fifths of the remainder agricultural laborers and farmers, the great bulk being exceedingly poor and depending on immediate employment for subsistence. And a study of the Board of Trade returns for the last few years confirms the same opinion. 'There seems no doubt,' says Mr. Giffen in a recent report, 'of the broad facts that the majority of the adult male emigrants are laborers, and of single adult female emigrants, domestic servants.' In 1801 (a good sample of the years), out of 189,756 adults of British origin, 112,256 were males and 77,500 females, and the adult males were classified as follows :

Agricultural laborers	14,797
Unskilled laborers and miners, etc.	36,521
Occupation not stated	26,663
Mechanics and skilled laborers	9,717
Farmers and graziers	3,704
Clerks, shopkeepers, etc.	4,773
Professional men	11,467
Miscellaneous	4,614

"It may reasonably be assumed that the majority of those whose occupations are not stated were also unskilled laborers; hence it is probable that some 70,000 out of 112,256, about 63 per cent., were of this description."

But it is not clear that emigration has accomplished what was hoped from it. The pauper cannot go, despite the theory that emigration was to relieve the weakest portion of the community; and the receiving country rejects him, and the regulations which agents of government here and abroad have sought to enforce constantly tend to encourage the better class of emigrant. Macintyre, writing 50 years ago, insisted on this: "Emigration, as it is carried on from this country, does not afford any relief to the masses of the people reduced to the verge

of starvation." "The conditions required of the persons selected for emigration show that they are picked individuals." Emigration has done little or nothing toward elevating the lowest classes of the people.

The most skilled artisans, on the other hand, do not generally go; and it is doubtful, then, if the productive power of England has been decreased, while the productive power of the English colonies and other countries has been increased. Whether this aids the country from which the emigration occurs is a debated point. (For the effect on the countries into which the emigration flows, and for statistics, see IMMIGRATION.) Of other countries than England Palgrave's *Dictionary* says:

"Scotland has sent out a steady stream of emigrants whose departure has only strengthened those who were left behind. Ireland, partly from poverty, partly from political causes, has been rapidly depleted of the stronger part of her population. In examining the emigration from other countries, we also find special phases to arrest us. Norway and Sweden have both been centers of a large emigration, which now appears to be losing strength. In Norway the causes and effects have been akin to the case of Scotland. In Sweden the parallel is rather with Ireland. In Italy the large annual emigration is becoming a serious drain, and the face of the country is already showing this. The loss of the more enterprising peasantry is making more helpless those who are left behind. Germany, on political grounds, is struggling with the tendency to emigrate; she does not wish to lose her soldiers at the best period of their lives."

(For references, see IMMIGRATION.)

EMINENT DOMAIN.—The right of eminent domain is the right to take private property for public uses. It is a common phrase in America, tho until recently little used in England, and seems to be derived from a phrase of Grotius (*De Jure Belli ac Pacis*, l. i. chap. iii. vi. sec. 2). The Fifth Amendment to the United States Constitution provides that it must always be used with just compensation to the owners of the property taken. (For a discussion of this, see COMPENSATION.)

EMPLOYMENT. See OCCUPATION and UNEMPLOYMENT.

EMPLOYMENT BUREAUS. See UNEMPLOYMENT.

EMPLOYERS. See PROFITS; WAGES OF MANAGEMENT.

EMPLOYERS' LIABILITY LAWS.—These are laws holding employers liable for accidents to their employees when legitimately engaged in doing the employer's work. The agitation for such laws has played and still plays no small part in the labor movement. Of the situation in America, Mr. Carroll D. Wright says (*The Industrial Evolution of the United States*, pp. 278-281):

"Under the common law as it exists in England and America and in the greater part of the continent of Europe, where the Roman law is the precedent, it is the rule that the principal is responsible for the acts of the agent, the same as if he performed the acts himself. There are, of course, many modifications of this rule under special circumstances, but the general rule is as stated. It is curious, however, to note that this rule does not apply, generally and in broad terms, where the person injured by the agent or employee of an-

other is also an agent or employee of the same principal; that is, in simple terms, if A is the proprietor of a factory, a works, or a railroad, and B and C are employees of A, and B is injured through the carelessness or negligence of C, he cannot recover of the proprietor A, because B and C are what are known under the common law as coemployees, and the defense of coemployment would be set up in the courts of the common law, under which it would be claimed that A was not liable to B for any damages resulting from injuries received through the negligence of C. This doctrine, too, is subject to modifications and restrictions, but the broad principle is as stated. Of course, if it could be proved by B, who was injured through the carelessness or negligence of C, that the carelessness or negligence was really that of the proprietor A, then he could recover, but not otherwise.

"It is usually assumed, under the common-law rule, that the employee engages in the services of a company or of an individual employer with a full knowledge of all the risks, dangers, and responsibilities of the peculiar employment, and, therefore, assumes those risks, responsibilities, and liabilities under any dangers which exist; but such risks which the employee takes are considered only the ordinary risks. The rule does not apply where the risk is not of such a nature as to be reasonably known and assumed, nor does it apply under circumstances where the risk is known to the employer, but not to the employee, nor where the employer is under a positive duty, and the injury results from neglect of that positive duty, nor, as already remarked, when the injury is incurred through the negligence of the employer himself, except, in the latter case, where the employee may have contributed to the negligence."

Of the coemployment principle Mr. Wright says in part: "To apply this rule when a brakeman on a railroad line, it may be hundreds of miles in length, by the negligence of a switchman whom the brakeman never saw, whose character he did not know when he entered the service, and to whose negligence the brakeman could not possibly have contributed, receives serious personal injury, appears, to the ordinary mind, the very height of absurdity. Under the old rule the brakeman cannot, under the circumstances just described, recover any damages from the railroad corporation, because the brakeman and the switchman are considered as coemployees of the same principal. So in a factory, the attendant of a loom may be quietly and industriously attending to her business as a weaver, and through the negligence or carelessness or drunkenness of one who attends the engine in the engine-house 1000 feet away, loses an arm; under these circumstances the weaver cannot recover damages from the proprietor or owners of the factory under the common-law rule.

"These illustrations show how thoroughly absurd that rule appears to many men and to many most excellent lawyers and judges. In order to remedy the difficulty recourse has been had to statutory provisions, by which the rule is abrogated or its application limited.

Recent Legislation.

The first attempt at such limitation was by the Parliament of Great Britain. After long agitation, investigations by parliamentary committees, and discussions in Parliament, a law in great measure abrogating the common-law rule was enacted in 1880; and that act called the attention of employers and employees everywhere to the inconsistencies of the common law. Many corporations resisted the enactment of laws which would tend, as they claimed, to the great increase of expenses of running their works or roads, and much fear was expressed on the passage of the bill through Parliament that the results would be disastrous to industry and prevent dividends on the stock of railroads. The experience of the English law, however, has not substantiated such fears, while one of the very best effects of the law has been to induce greater care in the selection of agents. It may be that this is the very greatest benefit that can be derived from such a statute, for the careful administration of the railroad service is one of the most vital features of railroad management, so far as the public is concerned; and if the statutory limitation of the common law stimulates the selection of the very best skill in the employment of men, it certainly justifies its enactment. It is true that the financial disasters predicted have not occurred.

"All the agitation in England relative to the subject has reappeared in the United States. Labor organizations demand it in their platforms and declarations of principles, learned writers have insisted upon the justice of it, and judges have indorsed it. The

first law, however, following in any great degree the English legislation was quietly passed by the Alabama legislature February 12, 1885. The Massachusetts legislature, after several years of consideration and a very careful investigation of the law and facts by the Bureau of Statistics of Labor, passed an act to extend and regulate the liability of employers to make compensation for personal injuries suffered by employees in their service. This act was passed in 1887. These two States are the only States that have practically reenacted the English law of 1880. Many other States have, in some way and to some extent, weakened the force of the common-law rule. California, Colorado, Dakota, Florida, Georgia, Iowa, Kansas, Minnesota, Montana, Wisconsin, Wyoming, Illinois, Indiana, Kentucky, Texas, and it may be others, have in some way limited the old common-law rule.¹⁵

The whole question of employers' liability is fully discussed in the report of the *Massachusetts Bureau of Statistics of Labor for 1883*; in the *Eleventh Annual Report of the Bureau of Statistics of Labor and Industries of New Jersey, 1888*; in the *Fifth Annual Report of the United States Commissioner of Labor, 1889*.

The English law provides that :

"In five specified cases the workman who has sustained injury through the action of a fellow-workman may bring an action for redress as tho he were not in the same employment. Where the injury happens by reason of (1) any defect in the works, plant, or machinery; (2) the neglect of any person engaged in superintendence; (3) the neglect of any person to whose orders the workman was bound to conform when the injury took place; (4) the act of any fellow-servant done in obedience to the rules, by-laws, or instructions (if improper or defective) of the employer or his delegate; (5) the negligence of any signalman, pointsman, or person having charge of a locomotive on a railway, the workman is put on the same footing with the public. But for the purpose of the act 'workman' is so defined as to exclude seamen, domestic servants, and any servant not employed in manual labor. When an injury has been sustained notice must be given, and the action must be brought within a limited time, and the amount of the compensation must not exceed three years' earnings of a workman in that employment. If the injury prove fatal, the right of action passes to the dead man's representative."

The act was originally passed for seven years only, and since 1887 has been renewed from year to year. Parliament has not placed the law on a permanent footing, and changes and additions are constantly being agitated for, and will doubtless be made.

ENFANTIN, PROSPER, was born in Paris in 1796. Coming under the influence of St. Simon (*q.v.*), he acted with Bazard (*q.v.*) as leader of the movement after St. Simon's death in 1825. The two leaders delivered lectures and attracted considerable of a following. In 1831 the school attempted communism on some property of Enfantin's at Menilmontant. But commencing as a devotee of mysticism, Enfantin finally adopted the doctrine of "free love;" this brought him into trouble with most of his fellow-religionists. Bazard differed from Enfantin, who became, after Bazard retired, the sole chief of the St. Simonians, called "the supreme father" in their somewhat fantastic religious forms. But their practices produced troubles. Enfantin was condemned on August 28, 1832, in company with Charles Duveyrier and Michel Chevalier, to a year's imprisonment and a fine of 100 francs for having assisted, without previously obtaining permission, in the formation of an association consisting of more than 20 members, and in the promulgation of articles injurious to public morality.

The penalty was before long commuted, and Enfantin made his way to Egypt, where he

studied the question of piercing the Isthmus of Suez.

Subsequently he returned to Paris, and was appointed, in 1845, a director of the first company for constructing a railway from Paris to Lyons.

After the Revolution of 1848 he founded, in conjunction with Charles Duveyrier, the journal *Le Cr dit*, which continued to appear till 1850. Finally Enfantin became the administrator of the second Paris, Lyons and Mediterranean Railway Company, a post which he continued to hold till his death, at Paris, in 1864.

Before the fall of the St. Simonian school, Enfantin published, in conjunction with others, *Doctrine of St. Simon, Exposition*, 2 vols., 1830-32; afterward, in his own name, *Economie politique et Politique; Morale*, etc.

ENGEL, ERNST, was born in Dresden in 1821, and after completing his studies and traveling extensively, he became, in 1848, manager of the recently founded Royal Saxon Statistical Bureau. In 1858, on account of attacks from the Saxon Chamber, which his official activity had called out, he resigned this position and founded a Mortgage Insurance Company at Dresden, but in 1860 was called to the head of the Prussian Statistical Bureau at Berlin, where he remained 22 years, earning the position of one of the leading statisticians of Europe, and issuing many private as well as official works. (See EXPENDITURES.) In 1882 he resigned his position, and has since resided near Dresden.

ENGELS, FRIEDRICH, was born at Barmer in 1820. A clerk from 1837-41, he discharged his military duties and then entered his father's cotton business at Manchester, England. Visiting Paris in 1844, he met Karl Marx (*q.v.*) there, and he became his lifelong friend. In 1847 he went with Marx to Brussels. Banished from Paris and Brussels, Marx and Engels published the famous communist manifesto. (See SOCIALISM.) From 1848 to May, 1849, he was with Marx on the *Neuen Rheinische Zeitung*, published at Cologne. He took part in the South German uprising of 1849. On the suppression of the revolution he returned to England and reentered his father's business, remaining in it till 1869; after this he resided in London. He wrote numerous German works, but is best known as the editor of the second and third volumes of Karl Marx's works, published after Marx's death. Engels spoke 10 languages, and wrote in English the *Condition of the Working Classes in England in 1848*. Among his German works are *Die Entwicklung des Sozialismus von der Utopie zur Wissenschaft und Der Ursprung der Familie, des Privateigentums, und des Staats*. He died in London in 1895.

ENGLAND AND SOCIAL REFORM.—In this article, to gain continuity of development, and for convenience of reference, we outline the general development of English social reform, referring the reader to separate articles for all details.

I. STATISTICS.

The supreme legislative power in the British Empire is by its constitution given to Parliament (*q.v.*). The present form of Parliament, with its two houses, dates from the fourteenth century. The union of the English and Scotch parliaments was effected in 1707, and of the British and Irish in 1801. By the Reform Bill of 1832, the constituencies were materially increased in number and much more equitably arranged.

The Reform Bills of 1867-68, 1884, and 1885 extended the suffrage, till to-day there is practically complete household suffrage, and to a less extent of lodgers, tho many still lose their vote by change of residence and the registration system. The electors are 4,862,758 in England, 619,091 in Scotland, and 747,271 in Ireland—about one sixth of the total population; 135,605 voted in 1892 as illiterates. All elections are secret votes by ballot. The executive government is vested nominally in the crown, really in the cabinet of ministers. The unit of civil government is the civil parish, of which there are 14,684. The Local Government Acts of 1888 and 1894 created respectively county councils and parish councils elected by the voters, thus giving complete democratic local government. Until 1894 the vestries had been almost wholly in the power of wealthy parish churchmen. The population of Great Britain and Ireland in 1891 was 38,704,211, for an area of 120,979 sq. miles. (See POPULATION.) Nearly one seventh of the total population is concentrated in the metropolis. The population per square mile in 1891 was, for England and Wales, 498; Scotland, 135; Ireland, 144.

The established church of England is Protestant Episcopal, with two archbishops and 32 bishops in England. Private persons possess the right of presentation to about 8500 benefices; the other benefices belong to the Queen, the bishops, and universities. The church income from ancient endowments is estimated at £5,609,417, and from benefactions since 1703 at £284,386. The total annual income of the church is about £7,250,000. The number of clergy is about 27,000 (24,232 doing duty in the church). Other religious bodies in England have about 15,000 chapels and 800,000 members. The Church of Scotland, established in 1560, is Presbyterian, with 1553 parishes and 1800 clergy. The Free Church, established after the Disruption, has 1050 churches and 1260 ministers. The Episcopal Church has 266 clergy and 268 churches or missions. The "Church of Ireland" (Protestant Episcopal) was disestablished in 1869. It has 1500 clergy, 1450 churches, and 600,000 members. The Roman Catholic population of Ireland in 1891 was 3,547,397. The income of the Church of Ireland previous to the disestablishment was £600,000, and by the act of disestablishment, £7,500,000 were allotted to it.

Religion.

For EDUCATION; JUDICIARY; CRIME; PAUPERISM; FINANCE; DEBT; ARMY AND NAVY, see those articles. The proportion of the population engaged in 1891 in agriculture was 1,311,720; in textiles, 1,283,589; dress, 1,099,833; in transport, 935,866; in mining, 561,637. From 1851 to 1891 the proportion of the population engaged in agriculture decreased from 20.9 to 9.9 per cent.; those in manufacturing, from 32.7 to 30.7. Those engaged in transport and industrial service increased from 15.1 to 20.1.

The value of the mineral produce in 1893 was £79,767,651 (coal, £55,809,808; iron, £2,827,947). Those employed in or about mines were 718,747 (underground, 570,978). In the textile industries the capital employed is now about £200,000,000, and about 5,000,000 of people are dependent upon it. More than one half of the exports of England consist of textiles. The principal exports in 1894 were cotton (£66,586,108), woollens (£18,757,418), iron and steel (£18,731,140), coal (£17,375,140), machinery (£14,265,122), chemicals, apparel and haberdashery, linen, hardware and cutlery.

The principal imports were grain and flour (£48,000,000), raw cotton (£32,000,000); wool—sheep and lambs' (£24,000,000), meat (£22,000,000), sugar (£19,000,000), butter (£16,000,000), wood (£17,000,000), silk (£12,000,000). The exports of British produce in 1894 were £216,194,239; the total imports, £408,505,718. The sailing vessels in 1893 numbered 8211, with 34,659 men; steam vessels, 2446, with 27,809 men.

There were in 1894, 20,008 miles of railway open in Great Britain, with a capital of £800,000,000 in England, £131,000,000 in Scotland, and £39,000 in Ireland. The expenses were £47,000,000, or 56 per cent. of the total receipts. There were 3813 miles of canals and 214,804 miles of telegraph wire. There were in 1894, 20,016 post-offices. Post, telegraph and postal savings banks

are in Government hands. (See TELEGRAPH; also POSTAL SAVINGS BANKS.) There was issued in 1893 from the Royal Mint £9,266,251 in gold, £1,008,971 in silver, and £46,664 in bronze.

II. HISTORY.

The story of social reform in England begins in the earliest times—begins with Alfred's efforts at establishing justice and promoting learning, if not with Augustine and with Aidan. The early English Church and some of her kings struggled to put down slavery. Anselm and Theobald withstood Norman oppression. In 1215 the knights at Runnymede, led by Stephen Langton, Archbishop of Canterbury, won from King John the Great Charter, with its fundamental rights of freedom, freedom from imprisonment without trial, and from taxation without the consent of the council of the nation. In 1265 did Earl Simon of Montfort, for Henry III., summon the burgesses to Parliament, and under Edward I. they came, reasserting the old rights of the Anglo-Saxon Witenagemot.

As early as 1360 did John Ball (*q.v.*), "the mad priest of Kent," preach a medieval Christian socialism, asking in the name of the common folk by what right men called lords were greater folk than they, and declaring that only by the toil of the villeins these lords held their estates. Hanged at St. Alban's for his bold words as well as for the large part he played in the Peasants' Revolt, his spirit has never wholly died away, and continually reappears in the most unexpected quarters. One finds it alike in the rough poetry of Langland's *Piers Plowman* (1377) and in the courtly words of More's *Utopia* (1516). It enters in milder form into Erasmus' *Christian Prince*, and again in Harrington's *Oceana* (1656). It is voiced in Beller's proposed *College of Industry* (1695), and in Spence's land nationalization of 1775. (See these names.) The Peasants' Revolt (*q.v.*) itself marks an epoch in the development of English free-Development,

dom. Remorselessly put down, it yet freed England from serfdom, and led to what some call the "Golden Age" of Merrie England. But after the Golden Age came the Iron. In the sixteenth century the nobles, impoverished by the long French wars and the wars of the Roses, drove out many of their humble folk, and turned their fields in'to sheep walks for the raising of wool for the Flemish market, and at the same time fenced in many of the commons, calling forth the noble protest of Latimer's sermons. This robbery of the land by those who were its rulers but not its owners, together with the confiscation of the monasteries and other causes, produced the landless class and made necessary the Poor Laws (*q.v.*). These laws, altho turned by remorseless magistrates into a means of the degradation of England's poor, contained, nevertheless, the socialistic claim of the right of every man to receive opportunity for life and work from the State.

The contest with Charles, the Puritan Commonwealth, the English Revolution, were not movements of the industrial classes, but they laid the foundation of England's political democracy, and contain many noble lessons of equality and democratic spirit.

When, in the eighteenth century, the discovery of steam-power and machine production developed modern industrial England, it caused an economic revolution. Under the *laissez faire* teachings of Adam Smith, trade threw off restraint; manufacturers robbed cottages of their women and cradles of their children to employ them in factories utterly without sanitation, coining their blood into profits. Employees were worked like slaves and housed more poorly than the beasts, the whispers of Malthusianism quieting any stirrings of the conscience. It was necessary that men be killed, it was said; there was not room for all. It was these conditions that led to modern industrial legislation.

In 1795, Dr. Aikin, a Manchester physician, published a statement concerning the evil condition of the children working in the mills. In

Early Factory Legislation.

1796 a committee was formed in Manchester to inquire into the health of the poor. In 1802 the elder Peel brought in and passed the first bill for the preservation of the health and morals of apprentices and of others employed in cotton and other factories. It immediately accomplished nothing, being fatally defective; but it established the principle. Other bills introduced did little more. In 1824 a bill was passed, mainly owing to the efforts of Francis Place, outside of Parliament, and Joseph Hume within, giving trade-unions, which had secretly existed since about 1700, the right to partially organize. In 1830 Richard Oastler, speaking for the anti-slavery movement, discovered that there was "white slavery" in England, and from that date gave his time and strength in poverty, and even when imprisoned for debt, to exposing the facts of factory evils, and agitating for legislation. He accomplished little, however, till Lord Ashley, afterward the Earl of Shaftesbury, took up his cause. T. Sadler, in 1831, had moved a Ten Hours' Bill, but to no effect. A select committee was appointed in the matter in 1832, but only to gain time and prevent action. Lord Ashley, however, now taking hold, brought in a Ten Hours' Bill for Women and Children, which was read a second time in 1833. It was violently opposed, even by such individualists as Richard Cobden and John Bright. Finally Lord Althorp brought in for the Government and carried a Compromise Bill, which was better than nothing. Oastler, however, continued his agitation. Children's Employment Commissions of 1842 and 1843 published terrible revelations. A Factory Act was passed in 1844, and finally the Ten Hours' Bill in 1847.

Meanwhile Robert Owen, at his mills in New Lanark, had been putting in practice various reforms, and in the year 1817 laid a scheme of a socialistic community before the House of Commons. This act is sometimes considered the beginning of socialism in England; but it was not socialism as we understand the word to-day. Owen's utopianism and evolutionary social democracy in industry have little in common. In 1825 Owen purchased New Harmony in the United States and started his short-lived community. In 1835 he founded an association of all classes of all nations; and during the dis-

cussions which arose over this the words "socialism" and "socialist" seemed first to have been used and thence to have been borrowed by the French writer Reybaud in his *Réformateurs Modernes* (1839).

The passage of the Reform Bill in 1832 had abolished the "pocket boroughs" and given England a taste of democracy. Slavery (*q.v.*) was abolished in the British colonies in 1834. The Poor Laws were reformed. The middle classes were now but enfranchised, but these reforms did little for the workmen. These Owen reached. The Owenite press, the *Crisis*, the *Pioneer*, the *Herald of the Rights of Industry*, and other papers, created a widespread movement. Within a few weeks half a million members are said to have joined Owen's Grand National Consolidated Trade-Union, including tens of thousands of farm laborers and women. The object was to put an end to all competition. The wealthier classes were alarmed. In 1834 six Dorchester laborers were convicted to seven years' transportation for the mere act of administering an oath. (See CONSPIRACY LAWS.) Monster labor congresses were held; 30,000 persons took part in a procession in London protesting against the judgment; over 250,000 signed a petition. Strikes were numerous. They generally failed, however. A levy of 18*d.* per member hurt the Grand National. It was too hurriedly organized, and did not endure. The trade-unions all suffered. Led by William Cobbett and William Lovett and others, working men began to turn to political methods.

Robert
Owen.

In 1838 a representative meeting of workmen drew up a program of political reforms which they held to be necessary. Speaking to the representatives, the Irish orator O'Connell called it their charter, for which they must strive. The name was a happy one; and in all the subsequent agitation this program was called the "People's Charter," and its supporters "Chartists." The charter called for the famous "six points"—manhood suffrage, equal electoral districts, vote by ballot, annual parliaments, abolition of property qualification for members of the House of Commons, and payment of members of Parliament for their services. Everywhere the charter was received enthusiastically by the workers. Enormous meetings were held in sup-

Chartism.

port of it. Orators, writers, editors, and poets were developed—O'Connor, Lovett, Cleave, Hetherington, and O'Brien being among the leaders. Every center had its Chartist journals. But there soon developed a division as to the means to the end. Some were in favor of an appeal to force, while many—probably most—were advocates of constitutional methods. In June, 1839, a petition signed by nearly 1,300,000 persons was presented to the House of Commons, "bound in iron hoops, four men bearing it," asking that the charter might be considered. By a large majority the House of Commons refused to take it into consideration. As might be expected, the relations between the Government and the people became very much strained; public meetings were forbidden; riots were of frequent occurrence;

while in secret meetings men were organizing and drilling. At Newport, Wales, there was an attempt made to rescue from prison one of the leaders. For taking part in this outbreak three of the local leaders were condemned to death, one of whom was Frost, a magistrate, who had been deprived of his office for his advocacy of Chartism. The sentence was afterward commuted to transportation. The agitation continued more or less vigorously until 1848, the year of revolutions. Risings were expected in all the great industrial centers, while London was the center of uneasiness. A meeting was called on Kennington Common for April 10, at which it was expected that half a million workers would be present. A procession was to be formed from there to carry the petition in favor of the charter, with 6,000,000 signatures, to the House of Commons. Great alarm prevailed; the procession was prohibited; the military under the Duke of Wellington was called out; cannon were planted to cover the meeting-place and the exits, and nearly 200,000 civilians were enrolled as special constables. After all these threatenings the gathering on the Common was not as large as had been anticipated, a heavy storm interfering. Not 100,000 were present, and as any other course would have been suicidal, the procession was given up. This was the end of Chartism. Strange as it may seem, a movement which was truly national suddenly collapsed when apparently at its highest. During all the ten years of the agitation it had been largely an economic change that was desired. Political change was only sought in order to secure economic changes. Every constitutional means had been tried and had failed, and now the Government had shown that if an appeal were to be made to force, it would use all its strength to crush the appeal, and would yield no quarter. Just while men were pondering the alternatives, a new door of escape was opened—gold was discovered in America, and New Zealand and Australia were calling for colonists.

The repeal of the Corn Laws in 1846, after the long free-trade agitation of Cobden and Bright, and the passage of the 'Ten Hours' Bill in 1847, gave hope of relief.

The close of the Chartist agitation witnessed the birth of organized Christian socialism (*q.v.*). Stirred by the events of the Chartist uprising and moved by the sufferings particularly of the sweated tailors in London, and of the agricultural laborers in the country, Charles Kingsley and Frederick Denison Maurice, clergymen of the Church of England, with E. Vansittart Neale, Thomas Hughes, J. M. Ludlow (see these names), organized a society under the avowed name of Christian

Christian Socialism.

Socialism. They published pamphlets and two papers, and started some cooperative stores. Their papers were soon discontinued; their stores either failed or were swallowed up in the larger Rochdale cooperative movement; but their thought lived. Kingsley's bold denunciation of the soulless Manchester school of political economy, his brilliant pictures of the sufferings and efforts of the poor, sketched in *Yeast* (1848) and in *Alton Locke* (1850), and

the deeper philosophy of Maurice, are still potent to-day.

From 1850-80 English trade-unionism was taking form and growing, with many ups and downs, into its present strength. The Rochdale cooperative movement, beginning in 1844, during this period made its phenomenal advance. The writings of Carlyle and of Ruskin struck strong blows against the orthodox political economy. In 1848 Mill published his *Political Economy*. Henceforth political economy was no longer to be a dismal science of theories, but a discussion of how to meet practical industrial problems. Mill himself, in his *Autobiography*, came to announce himself a socialist. There were other radical forces at work. From 1849 to his death in 1883 Marx resided in London. In London, also, was Mazzini. Opposed to socialism, as it was presented to him, he really preached the deepest and most ethical socialism. As early as 1847 Marx and Engels, corresponding with a London society, turned this society into a communist league; and the following year published from Brussels the manifesto of the communist party. In 1862 a party of French working men visited the International Exhibition in London and got into communication with English trade-unionists; and on September 28, 1864, the famous *International* was founded at St. Martin's Hall, London. Professor Beesly presided, and Karl Marx made an address. It was not at first a socialistic organization. Its simple aim was to unite the working men of all countries. Naturally it took a different coloring with different nations. In England it meant little more than an attempt at international trade-unionism, and took no deep root. The day of socialism was not yet.

Little as he intended it, the lectures in England of Henry George (*q.v.*), individualist as he proclaims himself, seem to have been the occasion for the first crystallization in England of modern socialist thought. His sharp words on the **Socialism.** land question, and the enormous circulation of *Progress and Poverty*, aroused general interest; yet, when organization came, the forces we have seen already at work produced socialism. According to Sidney Webb (*Socialism in England*), the coercive measures introduced by Mr. Gladstone's ministry against the Irish Land League had alienated many of the earnest Radicals from the Liberal Party. It became evident that Liberalism was not inconsistent with shameless international aggression in the interests of the officers and the bondholders. The neglect of English social questions became more and more pressingly felt. The "Democratic Federation" was founded in March, 1881, by the efforts of Mr. H. M. Hyndman, Mr. Herbert Burrows, Miss Helen Taylor (stepdaughter of John Stuart Mill), and some others. The only distinctively socialist proposal explicitly set forth in the first program of this organization was "nationalization of the land," placed ninth in the list; but it was from the first essentially a socialist body, and it changed its name in August, 1884, to the "Social Democratic Federation" (*q.v.*). Men joined like William Morris, Tom Mann, John Burns, and others.

This federation has been the largest, and in many ways the most active, of all English socialist societies. At the end of 1884, however, William Morris (*q.v.*) withdrew from the federation, and with others formed the Socialist League. The grounds of secession were mainly personal, but the new society soon developed a policy of its own, standing for a more communistic and less governmental conception of socialism. Publishing the *Commonweal* (1885), to which Mr. Morris gave many of his brilliant contributions, it exerted no small influence. About 1892, however, the organization and the *Commonweal* came under anarchist control; Mr. Morris withdrew, and the organization has virtually died.

A far more potent and unique organization of English socialists is the Fabian Society (*q.v.*), founded in 1883, and to-day still adding to its strength. Commenced mainly as an educational and propagandist center, it includes members of other societies, and has met with great success. In one year its members have given thousands of lectures and distributed still more thousands of socialist essays and tracts. It has influenced political parties, economic literature, and trade-union thought. It may be said to have created the London County Council (*q.v.*), and to have changed the thought of the working men's clubs of London.

These various societies, taking advantage of industrial depressions and discontent, have largely captured the English trade-unions for socialism. This "New Trade-Unionism" (*q.v.*) has grown steadily till 1895. The agitation in behalf of the unemployed in 1886, resulting in the prosecution at the Old Bailey of Messrs. Hyndman, Burns, Champion, and Williams, led, altho they were acquitted, to making socialism known and somewhat popular among the London masses. The great dock strike of 1889 saw the turning of the tide. Messrs. Ben Tillet, Tom Mann, and John Burns, all socialists, organized the dock laborers and won. It led to the organization of other trades thus far un-

organized. These new unions followed the new leaders, and the movement began to grow in the rank and file of even the old unions. By 1890 the new unionism was in the majority in the trade congresses, and in 1894 voted to support only collectivist candidates. The defeat of the Liberal Party in 1894, however, to which many of the old trade-unionists were allied, led to the older trade-unions securing a change in representation, giving the newer trade-unions less power, and thus defeating the new trade-unionism at the Congress of 1895. Some of the new trade-unions, too, have not endured. Some claim that there is a reaction against socialism and a return to agitation on older lines.

Labor representatives have indeed been in Parliament for some time. In the general election of 1873-74 no fewer than 13 "labor candidates" went to the polls; and Alexander Macdonald and Thomas Burt (*q.v.*), the two leading officials of the miners' national unions, were elected the first "labor members" of the House. But this does not mean any general political movement.

Altho largely enfranchised by the Reform Bill of 1867, English workmen in their trades congresses even rejected amendments in favor of manhood suffrage as late as 1882 and 1883. In order to win legal recognition at all for their trade-unions, the leaders had had to plant themselves wholly on the middle-class ground of the individual freedom of each man to sell his labor as he pleased, collectively or not. Even after trade-unions were themselves in 1871 fully legalized, even when "in restraint of trade," their members were still so liable to prosecution under vague combination laws, that the unions were engaged in a battle for mere existence down to 1875. At this date, however, the Liberal Party having been defeated largely by the division of the labor vote, a Conservative government wiped away the last vestige of the combination laws. But this long struggle for life had so indoctrinated their members with the individualist economy, that save for a few leaders like Allan of the Engineers and Applegarth of the Carpenters, the average trade-unionist cared nothing for parliamentary action. Even when free to act, their very successes made the trade-unions conservative. Men of ability, like Mr. Broadhurst, actually opposed eight-hour legislation; a motion in support of it was defeated by a large majority at a trade-union congress as late as 1889. The old trade-union policy favors gaining shorter hours and higher wages on pure trade-union lines, developing, too, the unions in benefit societies, with high dues and strong trade organizations.

Trade-unions in England in 1891 had a membership of 925,232, with an income of £1,175,346. The collectivist policy has, however, become among many so popular that, weary of the vast promises and slight fulfilment of both the Liberal and Conservative parties, they have organized (January, 1893), mainly under the lead of Mr. Keir Hardie, elected M.P., an independent labor party, its object being, as stated in the constitution as amended in February, 1894, "the collective ownership and control of the means of production, distribution, and exchange." This Independent Labor Party is growing rapidly in almost all parts of England, but especially in the north. Robert Blatchford's *Merrie England*, emphasizing the principles of the party, is estimated to have reached 2,000,000 readers.

Municipalism, however, is perhaps the main practical form that English socialism is at present taking. The formation of the county councils, and particularly of the London County Council, to bring together under one control the numberless boards and vestries that had power in various ways in London, was itself a step toward socialism. Says Professor Ely (*Socialism and Social Reform*, p. 60);

"The drift is unmistakable. Two illustrations will suffice. The London County Council has recently acquired some 21 miles of street railways (tramways), and proposes to operate these lines. While the ownership and operation of municipal monopolies does not, of necessity, mean socialism—while, indeed, an anti-socialist may favor such ownership and operation—the significant point is that in Lon-

Municipalism.

don the change was brought about by socialist intent, and as part of a socialist program. The second illustration is found in the abolition of the contract system in the construction of artisans' dwellings by the municipality. More and more is the policy being forced of making the county council do its own work and be the model employer."

The municipalism of cities like Birmingham and Glasgow is well known. (See MUNICIPALISM; also these cities.) Based on such facts as these, the friends and the foes of socialism alike declare that socialism is coming in England. Bitterly does Mr. Herbert Spencer, for example, complain that the "numerous socialistic changes made by act of Parliament, joined with numerous others presently to be made, will by and by be all merged in State socialism—swallowed in the vast wave which they have little by little raised." Of this the passage of the Parish Councils Act, in 1894, is a noteworthy instance.

Some, however, claim that there is a reaction. (See INDIVIDUALISM; ANARCHISM; SPENCER; TRADE-UNIONS.) The Liberty and Property Defense League (*q.v.*) and writers like Spencer, Donisthorpe, Herbert (see these names), conduct a continuous campaign against socialistic ideas. Yet the general drift is toward socialism.

Says Mr. Sidney Webb, in his *Socialism in England*: "The scientific difference between the 'orthodox' economists and the economic socialists has now become mainly one of terminology and relative stress, with the result that one competent economist, not himself a socialist, publishes regretfully to the world that all the younger men are now socialists, with many of the professors."

In the Church, the Guild of St. Matthew and the Christian Social Union exert no little influence for a general socialism. The Rev. Stewart Headlam and Mr. Bruce Wallace, with his Brotherhood Church and Trust, are among the most active socialist workers in London. In Manchester and elsewhere, the Labor Church, led by Mr. John Trevor, is a religious movement wholly outside of the organized churches, but voicing the deep religious side of a part of the English socialist movement.

There are many other movements. The Land Nationalization Society (*q.v.*) has for its principal exponent the eminent naturalist, Mr. Alfred Russel Wallace. The English Land Restoration League (*q.v.*), a very vigorous organization of widespread influence, adheres more closely to the principles of Mr. Henry George. The cooperative movement is very strong. It has in Great Britain and Ireland 1589 societies, with 1,207,511 members and a capital of £ 17,000,000.

(For movements for WOMAN'S SUFFRAGE; THE TEMPERANCE MOVEMENT; SOCIAL PURITY, see those subjects. See also COOPERATION; FACTORY LAWS; SALVATION ARMY; TRADE-UNIONISM; UNEMPLOYMENT; UNIVERSITY EXTENSION.)

Among the best books on social reform in England are: Freeman's *Growth of the English Constitution*; Green's *Short History of the English People*; Thorold Rogers's *Six Centuries of Work and Wages*; Ashley's *Eng-*

lish Economic History and Theory (2 vols.); Hyndman's *Historical Basis of Socialism in England*; Gibbin's *Social Reformers*; Jones's *Life of Owen*; Wood's *English Social Movements*; Mr. and Mrs. Webb's *History of Trade-Unionism*; Webb's *Socialism in England*; Toynbee's *Industrial Revolution*; Holyoke's *History of Cooperation*; Schulze Garvernitz's *Social Peace*; Bliss's *Handbook of Socialism*.

ENTAIL in law means "the limitation of land to certain members of a particular family or line of descent" (*Century Dictionary*) or "an estate settled with regard to the rule of its descent" (*Wharton's Law Lexicon*). The origin of entail is to be looked for in feudalism (*q.v.*), under which system each man's rights, duties, and social consideration depended on his relation to the land, and therefore it seemed well to try and fix the tenure of land and permit its disposition. Entails were thus a political and social institution, and were found in all countries where feudalism existed. They have disappeared, however, in most countries in the political changes of the last of the eighteenth century. In England they have survived, tho greatly changed by many and complicated laws.

ENTREPRENEUR.—This is a French word, to-day frequently used in English to designate the person who organizes and directs the productive factors. The English words formerly used for this, *undertaker* and *adventurer*, are now used in other senses. (See WAGES OF MANAGEMENT.)

ESSENES.—A Jewish sect of mystic ascetics, who combined Jewish, Greek, and Oriental doctrines with communistic and ritualistic modes of life. They are not spoken of in the Bible, very probably because they dwelt in retired communities. They represented the mystic and ascetic forms of Judaism, as opposed to the orthodox Pharisees and rationalistic Sadducees. Neither their name nor origin have been satisfactorily explained. They left us no writings of themselves, and Philo and Josephus are our only authorities as to their habits and beliefs. They appear to have separated themselves from the commercial and political life of the cities and towns, and to have dwelt in small and isolated villages. Most of them were not far from the Dead Sea. Their most distinctive characteristic was *ascetic communism*. They literally had all things in common. Philo says:

"There is no one who has a house so absolutely his own private property that it does not in some sense also belong to every one; for besides that they all dwell together in companies, the house is open to all those of the same notions who come to them from other quarters. There is one storehouse among them all; their expenses are all in common, as are their garments and food. They do not retain their wages as their own, but bring it into the common stock. They take care of their sick and honor their elders."
